(some of the figures in the original design are omitted in this etching); (2) an Indian-ink design of the sea and rainbow—a noble piece of impressive simplicity; (3) a quaint drawing of a half-human elephant and its baby, lithographed; (4) the Nativity, from an oil-painting on copper, a wondrous example of spirituality of mind and style; (5) St. Matthew; (6) The Queen of Evil—the Babylonian woman on the seven-headed beast; (7, 8, 9) three designs from *Paradise Lost*—Creation of Eve, Adam and Eve watched by Satan, and the Fall; (10) also from *Paradise Lost*, a lithograph of Eve dreaming of the Crucifixion. We cannot say that, in point of execution, this last is well up to the level of its companion-prints. Mr. Scott, with his usual force of mind, sympathetic insight, and directness of statement, gives a few paragraphs of descriptive text—just enough to show the reader what he should be looking for in the drawings, and to satisfy him that he is under good guidance. Highly accomplished as an etcher, Mr. Scott has worked at his best in this beautiful volume. Faithful he certainly is to the spirit and the externals of Blake's work; one can, nevertheless, every now and then pitch upon some point which partakes of the etcher's own style of characterisation more decidedly than of the designer's. Some of the subjects here selected might no doubt have been reproduced by some of the many photographic processes, all of which have obvious advantages over any mode of engraving, however intelligent and skilful; yet such is not the case always, Blake's picture of the Nativity, for example, being painted in such a way that photography could make nothing of it beyond what the artist himself was wont to call "blots and blurs." The Milton subjects—the marvellously pure and lovely *Creation of Eve*, and the others—are from the set of water-colours belonging to Mr. Aspland; a set which, with all its merits, must be pronounced markedly inferior to another and larger series of the same designs, which used to belong—and perhaps does still belong—to Mr. C. J. Strange. These last-named duplicates are among the foremost monuments of Blake's genius and power: they were not included in the Blake Exhibition at the Burlington Club in 1876, but the set here engraved from—that of Mr. Aspland—was represented there. W. M. ROSSETTI.

THE EXHIBITION OF THE ROYAL SCOTTISH ACADEMY.

Edinburgh: February 16, 1878.

If we were asked briefly to summarise our impression of the Scottish Academy Exhibition which opens to the public to-day we might say that it is a display of far more than usual excellence; that the landscapes and portraits maintain the prestige of a country to which Macculloch and Raeburn owed their birth; that there are among the figure-subjects several works of very exceptional power and beauty; and that the impetus towards "pastorals" among the younger artists, towards out-of-door figures set amid the sweet rusticities of field or cottage-garden, is yet more marked than in former years—an impetus doubtless owing something of its origin to Mr. Hugh Cameron and the example of his smaller pictures, but now carried out by our younger painters in other and somewhat different directions. Of course these remarks apply chiefly to our local

art, and, as usual, the exhibition owes much of its attractiveness to the works of London painters. These we need not particularise, as the majority of them are already well known to the readers of the ACADEMY. It is sufficient to mention that, among others, Pettie, Archer, Oulless, Halswelle, and Linnell are represented; that Sir Francis Grant shows a portrait of his brother, General Sir Hope Grant; that Mr. Holman Hunt's first picture of *Christ in the Temple* is sent from the Skelmorlie collection; and that an important sunrise by the Frenchman Corot occupies a place of honour in one of the rooms.

Notable among the works of local artists is Sir Noel Paton's ideal subject suggested by Shelley's lines,

"Oh! there are spirits of the air,
And genii of the evening breeze,"

a work far more complete and satisfying than the religious subjects upon which he has been engaged of late, and separated by its imaginative character and treatment from those fanciful scenes from fairyland with which his name is associated. In front against a distance of evening sky, purple hills and shadowed lake, kneels the poet, his back towards us and his face seen in raised profile, and turned with rapturous look upon the countenance of a fair spirit who floats above him on many-coloured wings, and with yellow hair lifted by the evening breeze, contemplating him with eyes of gentle earnestness, and laying her hands quietly about his neck. The contrast between the faltering eagerness of the passion-swept mortal and the sweet and sovereign calm of the spirit is given with marvellous power; and the picture seems to suggest more than its title indicates—*The Spirit of Twilight*—it might rather stand for that Lady of Beauty whom all poets seek, to whom—

"Each man whispers 'O my Queen,
I follow till I make thee mine.'"

For powerful colouring and vivid dramatic effect there is little worthy to stand side by side with the two figure-subjects by Mr. W. E. Lockhart, who was elected a member of the Academy the other day. The simpler subject of the two—the more harmonious and satisfying—is the well-known scene from *Gil Blas*, where the Archbishop of Granada dismisses his secretary for his too outspoken criticisms on one of his sermons. The moment is well and vividly seized. The youth descends the marble stairs in front, hat and cloak in hand, and with finger laid ruefully on lip. At the top of the stairs, seen against the dusky, ruddy tapestry, and flanked to the right by a pillar of soft red sandstone, is the irate churchman, blazing forth in all the splendour of his scarlet vestments and his fiery wrath. The other picture depicts a more complex scene, the last meeting of Ravenswood and Lucy Ashton in the *Bride of Lammermoor*. Here the situation is less sharply seized, the characters scarcely expressed with the same instantaneous truth. But the dazed half-unconscious look of the unhappy bride gazing in fixed and fascinated attention on the face of her old lover is tellingly rendered, and the painting of the rich details is worthy of all praise. The colouring of these two pictures reminds us not a little of the works of two somewhat dissimilar artists—Fortuny and Mr. H. Wallis. Another figure-picture, without the splendid tinting of these, but with colour whose delicate refinement is in admirable keeping with the tender sentiment of the subject, is Mr. Herdman's illustration to *The Pleasures of Hope*: a young fair-haired mother, draped in purple and pale yellow, and bending over her little child. Mr. George Hay has a charming scene of Border landscape, with a quaint mediaeval damsel crossing the stepping-stones of the foreground with her fair-haired attendant page. Among the younger painters, Mr. Hule shows a scene from the Civil Wars; and Mr. Robert Gibb gives us a battle-subject among the Crimean snows. Mr. W. D. McKay, in addition to some fine landscapes, has a

pleasant field-scene with figures removing potatoes from the "pit" where they have been stored during the winter. Of the painters of "pastorals" to whom we referred before, Mr. John R. Reid and Mr. John White are two of the strongest—the former with his *Village Belle*; the other with his *Good-bye at the Door*. Among the workers in pure landscape, Messrs. Bough, Fraser, Smart, Waller-Paton, and Beattie-Brown are prominent; and Mr. Cassie has a most poetic subject of a great ruddy full-moon brooding over the sea. Though many of the portraits are fine, their average is perhaps scarcely equal to that of some former years. Notable among the full-lengths are Mr. Herdman's likeness of Lord Provost Sir James Falslaw, our Scottish President's, Robert Dalgleish, Esq., and Mr. Paul Chalmers' black-clad boy, Master Lindsay Jamieson. Mr. Geo. Reid has a capital head of Dr. John MacRobin, of Aberdeen, and a low-toned but most striking picture of Mr. Francis Edmond, of Kingswell, seated at a writing-desk, with head raised and fronting us from the canvas. Two other portraits deserve special mention for their powerful and picture-like character—*The Sisters* of Mr. Patrick W. Adams, and the *Portrait of a Gentleman*, by Mr. John H. Lorimer, both the work of very young artists. With reference to them we may close our review of an exhibition which has given no little pleasure to one at least of the Edinburgh art-public—a public unaccustomed to be fed, like the Londoners, with a perpetual and ever-varying succession of the finest pictorial dainties.

JOHN M. GRAY.

THE FRENCH GOVERNMENT AND THE FINE ARTS.

WE have before commented on the encouragement given by the Government of France to the Fine Arts, and the vast number of commissions that French artists receive for national works. Every year the Government and the municipal authorities of the city of Paris purchase large numbers of works from the Salon, which are used for the decoration of Paris and the enrichment of the provincial museums; and every year also numerous orders for paintings in churches and other public places fall to the lot of French artists. But it would seem that even all this is not enough to satisfy the national desire for artistic decoration. In a recent Report by M. de Chennevières, approved by the Minister of Public Instruction, it is proposed that all the civil buildings in France, both in Paris and the provinces—the Hôtels de Ville, the Palais de Justice, the Facultés, and other public offices—should be considered as fields for artistic display, and that artists shall receive commissions to adorn them with great historical works. The French school, according to M. de Chennevières, by the nature of its studies and its love of great works, manifests a peculiar aptitude for monumental painting, and if this instinct is checked or stifled for want of room, it is to be feared that it will lose the power and the custom of producing such works, and "will fall rapidly to a decadence henceforth inevitable." To avert this dreaded catastrophe a circular has been addressed to all the Préfets by the Minister of Public Instruction, begging them to make known the present condition of all public buildings in their departments suitable for receiving pictorial or sculptural decoration; and it is proposed that ambitious young artists, especially those belonging to the town or department in which the building is situated, who may have distinguished themselves in the schools of art, shall at once be let loose in them. What would our poor Haydon have said to such an opportunity as this, who was all his life raging at not being able to gain some great wall against which to dash his fiery energy? But England does not concern herself like France with the aspirations of her painters, and if they want walls they must seek them from private individuals. She has not, it is to be feared, as yet advanced sufficiently in her

artistic education to consent to be taxed in order that her painters may have work and her police-courts be made beautiful.

ART SALES.

Messrs. Christie, Manson and Woods have this week been engaged in selling the various art collections of Mr. Jupp, including drawings, engravings, and rare illustrated books—among which the Bewick woodcuts were conspicuous. The prices do not require to be given in detail.

At the sale on the 13th inst., by Messrs. Sotheby, Wilkinson and Hodge of the coins of European Greece, from the Bank of England collection, the following were the chief lots disposed of:—Tarentum, gold, TAPA, Head of Juno veiled, *rev.* Horseman crowned by Victory, weighing 132 grs., 17l. 10s.; Selinus, silver, River-god Selinus sacrificing, *rev.* Apollo and Diana in chariot, 4l. 4s.; Abdera, silver, Griffin rearing, 6l. 6s.; Bergaeus, silver, Satyr carrying Nymph, 4l. 12s. 6d.; Audoleon, silver, Head of Pallas facing, 2l. 12s.; Archelaus, silver, Armed Horseman, *rev.* Half Goat looking back, 23l. 10s.; Alexander III., gold, Double Stater, 5l. 10s.; Alexander III., gold, two Staters, 4l. 12s.; Antigonus Rex Asiae, silver, Head of Neptune, *rev.* Apollo on prow, Tetradrachm, 7l. 7s.; Philip V., silver, Head of King, *rev.* Club in oak wreath, Didrachm, *rare and fine*, weighing 130 grs., 5l. 5s.; Perseus, silver, Tetradrachm, 4l. 10s.; other Tetradrachms of Perseus, from 3l. 7s. to 2l. 5s. each; Larissa and Pherae, silver, Hero struggling with bull, 9l. 9s.; Aetolia, silver, Head of young Hercules, *rev.* Aetolia seated on shields, weighing 262 grs., 13l.; Athens, very archaic Tetradrachm, 5l. 15s.; Elis, silver, Head of Juno, 4l. 4s.; Arcadia, Didrachm, Head of Jupiter, *rev.* Pan seated, weighing 184 grs., 52l. 10s.; Cnossus, silver, Head of Jupiter, 14l. 14s. The duplicate Greek coins from the British Museum sold on the same day were of small value; they included Tigranes, silver, *rev.* Antioch, seated, 6l.; and a Tetradrachm of Cleopatra and Antiochus VIII., silver, Heads of King and Queen, *rev.* Zeus seated, 2l. 2s.; another small property of Staters of Cyzicus and Lampsacus sold in single lots at prices varying between 5l. 10s. and 8l. 8s. for the Staters of Cyzicus, and between 3l. 16s. and 5l. 17s. 6d. for those of Lampsacus. The whole day's sale realised 472l. 5s.

A PICTURE-SALE of some interest is announced for Tuesday next by Messrs. Roos, at the Brakke Grond, Amsterdam. The catalogue includes twelve pictures from the famous Van Loon collection, lately bought *en bloc* by Baron Rothschild of Paris; and a small number from the Druyvesteyn collection at Haarlem and the Croese collection at Amsterdam. Forty pictures "from different collections" complete the list. It is not likely that any of the lots are of the highest quality; but one at least of the Van Loon pictures is interesting—namely, *The Battle of Nieuwpoort*, by Paulus van Hillegaert, a rare painter. The late owners of this panel attributed it to Bourguignon, but a recent examination has revealed the full signature of Van Hillegaert. A signed picture of N. Maes will probably be the chief lot among the Druyvesteyns; the Croese pictures include a portrait of Charles I. by H. G. Pot (1600–1654), and an early copy of Holbein's Dresden *Madonna*.

SOME months ago there died in Tunzenhausen, a small village near Soemmerda in the Prussian province of Saxony, the Rev. Johann Jacob Leitzmann, who was for a number of years the editor of a learned and influential numismatic journal in Germany. Born at Erfurt in 1798, Leitzmann entered the local school, and in 1818 the university of Halle, where he became a student of theology. After finishing his theological course and passing his examination, he was appointed parish minister in several villages of his native province. In early youth, and

especially since entering the university, he had given himself to numismatic studies, and it was to these researches that he sacrificed all the leisure hours of his ministry. Afterwards he started a numismatic paper which he edited till his death, and by which his name became of more than German renown. In combination with his editorial labours he began collecting coins of all nations and periods, and so indefatigable and extensive were his labours that at his death he left a collection of nearly 30,000 specimens. During the later years of his life he was principally occupied in describing and cataloguing these treasures; he has left a description of his collection on 1,797 quarto leaves in five volumes, beside a small library of numismatic and genealogical works. Vol. i. of the catalogue gives the description of 812 Greek, 1,912 Roman (among them 74 coins of Roman families), 213 Cuirian, 254 Oriental (and American), 259 East-Indian (and Australian), and 275 Siberian coins; vol. ii. contains those of the European States, except Germany (560 English—total, 5,712 numbers); vol. iii. those of Prussia (total, 4,117 numbers); vol. iv. those of the smaller States of Germany (total, 8,468 numbers); and vol. v. contains *Varia*, most of which belong to the Middle Ages, beginning with Attila (total, 5,100 pieces). The whole is now on sale at the personage of Tunzenhausen, the pastor of which will, on application, give any information wanted; eventually the collection will be disposed of by auction through a Leipzig firm.

NOTES ON ART AND ARCHAEOLOGY.

Messrs. Ellis and White have sent us Mr. William Morris's lecture on the Decorative Arts—their relation to modern life and progress—delivered lately before the Trades' Guild of Learning, and to be followed, we are glad to read, though at dates not yet announced, by other lectures by the same writer on the same subject. Heretofore only one or two of the many writings on Decorative Art have proceeded from practical and practised persons, and we have been too much invited to receive the aesthetic chatter of Harley Street, or the Saturday journals, as a substitute for words which shall not darken counsel. We have here, not indeed in this first lecture, any statement of the way in which the decorative artist must apply in his art the forms that appear in Nature. "Hereafter," says Mr. Morris, "I may have to speak of the manner in which you may learn of Nature;" but we have practical words that insist with the utmost of their sagacity and earnestness on the one condition under which art called in the narrow sense "decorative" can again have life and vigour—by the constant association of the worker in that art with the worker who is already an artist. Architecture, sculpture, painting, and the so-called decorative arts—"it is only in later times and under the most intricate conditions of life that they have fallen apart from one another." We shall not, however, attempt or pretend to give the argument of the pamphlet, but shall satisfy ourselves by saying that what is there written is written by no amateur dabbler with a workman's theme, but with the firm touch of a man who has lived, and enjoyed to live, in the work of which he writes; and, moreover, that these words of direct and practical good sense, the truth of which has been felt and experienced, long before they were spoken, are adorned by short passages of strongly felt description or allusion—curious happenesses, they seem to be, of spontaneous speech: witness, for instance, the delightful reflection on the English country into which the monuments of our land were "wrought," and of which "they are so completely a part." We refer to the passage beginning "The land is a little land, Sirs;" but we shall not quote it.

It should not fail to be observed that the Grosvenor Gallery Exhibition of Drawings will remain

open for a fortnight longer than had been anticipated. Thus to those lovers of art whose practical devotion to exhibitions is shown chiefly by somewhat tardy visits there remains an opportunity which they could not have counted upon.

MR. PAUL CHALMERS, the eminent Scotch painter, brutally attacked a few days ago in the streets of Edinburgh, and who died on Wednesday, is an artist who deserves to be much more widely known south of the Tweed. In losing him Scotland has lost one of her strongest and most individual painters. In London it is hardly too much to say that he is now best known by the exquisite etching from a work of some years ago which Rajon, the great etcher interpreter, lately contributed to the *Portfolio*, and which we noticed at the moment of its issue. But Paul Chalmers, though hardly past the age of forty years, leaves behind him much work scarcely less admirable than this which the engraver has popularised. Struggling in youth with many difficulties, he yet by the period of middle life had accomplished works both in portraiture and landscape of which there are few living painters who might not be proud. Among the more important of his landscapes were his *Running Water* and his *Last of the Harvest*; and among his figure-subjects we may name the *Love Song*, a girl with a nobly impassioned face, accompanying her words to a guitar. Mr. Chalmers' friends will miss in him a genial simple companion full of interest of various kinds; and Scotch art has lost one who was likely further to enlarge and enrich the sphere which it has made its own.

At the request of the Mayor and principal inhabitants of Wigan, an exhibition exclusively of pictures painted by Capt. Charles Mercier will be held in the Wigan Free Library on Monday next, for the benefit of the Royal Albert Edward Infirmary. The exhibition will include the pictures of *The Beaconsfield Cabinet*; *The Condemned Cell*; *The National Thanksgiving Service*; *The Late Prince Royal of Belgium*; *The Late Mr. Ward Hunt, M.P.*; and many public portraits of distinguished men of the day.

MR. WM. MORRIS has been elected President of the Birmingham School of Design for the ensuing year.

WE are only able this week to record the death on the 19th inst. of M. Charles Daubigny, at the age of sixty-one.

WE are glad to hear that the Burlington Club's principal exhibition of the season—an exhibition of drawings by the Dutch masters, to open probably early in April—will include some of the very finest drawings by the great artists of the seventeenth century now in private hands in England. The collections in which these drawings may be found are, we believe, but few. One of the richest of them—the collection of Mr. John Malcolm of Poltalloch—will probably contribute to the Burlington Club Exhibition no fewer than one hundred drawings: a contribution hardly less important than that of the same amateur to the exhibition of the Grosvenor Gallery. Mr. Malcolm's drawings include examples by nearly all the masters of the school whose drawings are, or have been within the last few years, attainable. Mr. C. S. Bale has also promised, we hear, to lend some very interesting and valuable examples; and so has Mr. George Smith. Mr. Seymour Haden's Rembrandt drawings will probably be forthcoming; and it is hoped that some very fine drawings of Ostade will be available to the club through the courtesy of one or two collectors. Mr. Richard Fisher and various other amateurs are likewise named among intending contributors of drawings by the greater or rarer masters. The club will issue to its members a carefully compiled catalogue, as is its wont in exhibitions of serious interest.

THE Rev. H. R. Haweis has commenced in the first number of the *Ecclesiastical Art Review* a series of articles on "Church Bells," and makes

some very pertinent remarks on the injury done to many towers by the ignorant and careless way in which the bells are hung. The *Review* also contains an interesting account of the revival of ecclesiastical art in England by Mr. A. W. Pugin and Mr. Hardman, and notes on wall-painting, embroidery, and other matters which concern the decoration of our churches. It is rather odd to find such a paper confusing the secular with the ecclesiastical by speaking of St. Paul's as the Metropolitan Cathedral.

WE understand that a number of antiquities from the neighbourhood of Diarbekr, and probably including some portions of the monuments discovered at Carchemish by Mr. George Smith, have been acquired by a private individual, and will shortly be on their way to England. In addition to the objects from this site we believe that a series of tablets and other antiquities from Babylonia will also shortly arrive. These objects have been obtained by the advice and selection of Mr. W. St. O. Boscawen.

A COMPETITION has been opened in France for a monumental statue to M. Thiers, to be erected at Nancy. Models are to be sent in before June 16, the jury being the same as that for the section of sculpture at the Universal Exhibition. A prize of 45,000 fr. will be awarded to the best model, and other prizes of the value of 3,000 fr., 2,000 fr., and 1,000 fr. to the second, third, and fourth competitors. The material in which the statue is to be executed is left to the artist, but it is not to be less than three metres high if standing, and of proportionate height if sitting. The pedestal is to be ornamented with reliefs and figures.

A COMPETITION for a monument to the sculptor David is also open, and the exhibition of the models is now being held at the chapel of the Ecole des Beaux-Arts. There are only twelve competitors, and four prizes will be awarded.

THE vase and chalice given as the subjects of the Sèvres competition this year do not appear to have stimulated young artists to any great effort. The competition designs for the vase are, according to the *Chronique*, miserably poor; while those for the chalice, though decidedly superior, have no claim to originality, the best being evidently suggested by early Italian and Renaissance works. These competitions, indeed, of which there are so many in France at the present time, seldom seem to evoke any great amount of talent. It is almost the rule to find failure attending them. Is it that good artists will not compete, or that the restrictions of a competition are fatal to their creative powers? The attention bestowed upon fience and porcelain decoration within the last few years would lead one to hope that some quite original style of design might arise for works of this kind, but for the most part all the best modern designs are simply copies, or adaptations of older ones. The Sèvres vase and drinking-cup at present under competition are intended as prizes at the Universal Exhibition—the vase for a prize in the Fine Arts Section, and the drinking-cup in that of Agriculture.

M. BAUDRY has executed the design for the diploma to be given at the Universal Exhibition. It is symbolical of France leaning on Peace in order to protect Industry.

M. BLANCHARD, the distinguished French engraver, and M. Oudiné, medallist, have been classed first among the candidates for the chair at the French Academy left vacant by the death of Martinet.

A SMALL but well-chosen selection of Gustave Courbet's works is being exhibited at the Cercle Artistique at Brussels. No doubt a more general collection of this clever painter's works will shortly be made. The difficulty is to know where to exhibit it.

A NEW edition, greatly enlarged, of Müller's well-known *Künstlerlexicon* is now being pub-

lished in numbers by the house of Ebner and Seubert, of Stuttgart. This new edition, edited by Herr A. Seubert, must not be confounded with Meyer's *Künstlerlexicon*, although it assumes the same title of *Allgemeines Künstlerlexicon*. That long-delayed work is still in abeyance, never having even got through the letter B. It is to be hoped that, sooner or later, some one may be found possessed of enterprise sufficient to carry it on; but, meanwhile, Herr Seubert's Dictionary may well fill the gap, and will doubtless be found by most students amply sufficient for all purposes of reference. It is hoped that this work will be completed in about twenty-five monthly parts, costing 1 M. 80 Pf. each.

THE newly-built picture gallery at Kassel which was opened at the end of last year to the public is a well-lighted and well-arranged building with plenty of room for receiving additions to the valuable collection already stored there. The collection has been considerably augmented of late years by paintings taken from the old electoral palaces and other places, and these can now be properly exhibited, which was impossible in the old building. A new catalogue has also been prepared, revised by the Director, Dr. Eisenmann, which will be likely to prove a boon to visitors. Unger's etchings from the pictures in this choice little gallery give those who have never visited it a good idea of the treasures it contains.

THE sensation picture by Gabriel Max, which is at present exciting attention in Germany, is a large work now being exhibited at the Austrian Art Union. It is called *The Child-Murderess*, and represents a mother with the little baby whom she has loved and killed in her arms, crouching in a desolate place by the side of a stream and giving the little bleeding head one passionate kiss before throwing it into the water. The face of the woman is bent down and partly hidden, so that much is left to the imagination in this work, but it is powerful enough notwithstanding to produce a painfully strong impression on the mind. In point of colour and execution it is said to equal, if not to excel, some of Max's most famed works.

WE have received through Messrs. Williams and Norgate the first three numbers of a new German publication entitled *Der Formenschatz der Renaissance*. In the dearth of original design which marks the decorative and industrial art of the present day, it is decidedly advisable to seek the best models for imitation from a time when art was still creative, and even the workman invented his patterns instead of copying them. Those who admire German art in its Renaissance development will find abundance of such models here, drawn from the works of Dürer, Holbein, Altdorfer, Aldegrever, Beham, Virgil Solis, Jamnitzer, and numerous other masters, who made ornament their study and who have left beside their subject-pieces a large number of simply decorative designs. These designs, many of which are elaborate works—such as the Regendorff coat of arms; a rare woodcut by Albrecht Dürer; three parts of his great Arch of Maximilian; the Jane Seymour cup by Holbein, in the Bodleian Collection; two illustrations from Hans Burgmaier's *Triumph of Maximilian*—are excellently reproduced on thick toned paper, as many as from ten to fourteen being given in each number. The work can scarcely fail to be useful in suggestions to art manufacturers, and others who are desirous of gleanings instruction from the works of a past time for use in the present; and even those who have no such practical purpose in view will be likely to find pleasure in its numerous rich, grotesque, and fanciful illustrations. It is published by Georg Hirth, of Munich.

A NEW ethnographic gallery has just been created in the Hôtel des Invalides containing a collection of the various types of warriors all over the world, from the South African negro and

Australian bushman to the splendid Maori chief and the accomplished European soldier. The models are all of the natural size, executed in plaster and painted to imitate life. Some of these warriors are only in possession of stone implements, others have weapons of bone, the Africans carry iron bows, while others bear fire-arms of various kinds. The collection, which has been formed by Lieutenant-Colonel Le Clerc, is certainly a curious one, and by the variety of type and costume that it makes known it is likely to be of interest to artists and other seekers after picturesque combinations, as well as to the scientific student of ethnography.

UNDER the title of "Spogli Vaticani" Signor Adam Rossi is publishing in the *Giornale di Erudizione Artistica* a number of documents drawn from the archives of the Vatican. The title would certainly lead one to suppose that these documents had never been discovered before, but, so far from this being the case, many of them have been published over and over again, while others have recently been made known by M. Eugène Muntz in the *Chronique des Arts*. Very little new "spoils," we fear, will henceforward be found in the Vatican, and certainly none has been gained by Signor Rossi.

AN exhibition of the artistic remains of the late Heinrich Funk has recently been held in the Museum at Stuttgart. As many as 525 drawings of different sizes and degrees of finish were shown, beside many large compositions and finished oil-paintings. Funk is an artist who is very little known out of Germany; but he had decided original talent, and was one of the most productive of painters. His works, both in colour and black-and-white, are to be met with everywhere in Germany. Two of his best landscapes are in the Städel Institute.

A FESTIVAL in honour of Winckelmann was recently held in Frankfurt. Numerous speeches and a discourse by Dr. Becker on the "Museums of Antiquity" were delivered on the occasion, and a copy of Angelica Kaufmann's portrait of the distinguished German critic was presented to the Historical Union.

THE STAGE.

MR. BURNAND's parody of *Diplomacy*, to which he has given the title of *Dora and Diplomacy*; or, *a Woman of Uncommon Scents*, belongs to the old-fashioned school of burlesque pieces which aim at amusing by caricaturing the leading features of some well-known dramatic production. Of late years there has been—at least in this country—a growing disposition to discountenance parody, on account of its tending to degrade the object travestied, and to encourage a vulgar and irreverential attitude towards works deserving of better treatment. That our fathers were not severe in this way is evidenced by the long popularity of Poole's *Hamlet Travestie*—the ghost in which piece was accustomed to provoke mirth by confidentially winking his eye and pointing over his left shoulder in token of his wish to retire with the young Prince of Denmark to a more convenient spot for conference. Parodies of so direct a kind have now, however, become decidedly out of fashion; nor is it likely that the rare talent of Mr. Burnand in this direction will be able to revive them. The new piece at the Strand is, however, an amusing and withal a harmless production. It brings into relief weak points in the original and incidents so closely bordering on absurdity that it requires but the proverbial one step to render them absurd; but there is no ill-nature in the piece. The little peculiarities of the performers at the Prince of Wales's are mimicked with curious accuracy, though, of course, with some amount of exaggeration, by M. Marius, Mr. Penley, Miss Verna, Miss Sanger, and Mr. Cox. This is, indeed, one of the chief sources of the drollery of the performance.

MR. NEVILLE MORITZ, the eminent Hungarian actor, whose arrival in London was lately announced, will make his first appearance on the afternoon of March 2, at the Queen's Theatre, when he will play Othello to Mr. Hermann Vezin's Iago. It is said that George Eliot and Mr. Tennyson have both promised the support of their presence to the illustrious artist.

THE thousandth consecutive performance of *Our Boys*, on Tuesday last, was witnessed by the Lord Mayor and other civic dignitaries, who appeared in their state robes. So large was the audience that the management were enabled to announce that the receipts, which were destined to be handed over to the Lord Mayor for charitable purposes, reached the large sum of 300*l*. Messrs. James, Thorne, and Byron spoke *à propos* epilogue in the form of a dialogue written for the occasion; and in brief, if thousand-night "runs," with a prospect of another thousand nights yet to come, were conducive to the interests of dramatic art, no satisfactory feature or legitimate ground for rejoicing would have been wanting to the proceedings.

THE death is announced of Madame Guyon, *sociétaire* of the Comédie Française. Madame Guyon, who was in her fifty-seventh year, is said to have been originally a lace-worker. After some practice on the provincial stage she gained admission to the Conservatoire, and rapidly rose to distinction in her profession. Tragedy was her forte. She was the original Dona Sol in Victor Hugo's *Hernani*.

MUSIC.

A NEW concert-overture, by Mr. Thomas Wingham, was the opening piece of last Saturday's concert at the Crystal Palace. Mr. Wingham is no stranger at Sydenham, where several of his previous works have from time to time been heard. His latest composition may, so far as can be judged from a single hearing without an opportunity of examining the score, be pronounced one of his most successful. In its form it closely follows classical models; its outlines are clear, its subjects pleasing, and its instrumentation skilful. Its success was not only genuine but well-deserved. Schumann's great symphony in D minor is a work which is so seldom to be heard, except at the Crystal Palace, that its appearance in the programme there is always most welcome. Its rendering on Saturday was one of the most perfect conceivable, such a one (as we have before often had to remark on similar occasions) as can only be heard at Sydenham. M. Wieniawski was the instrumental soloist at this concert. He played as finely as usual, but was not happy in his selection of pieces; it is difficult to say whether the first movement of Viotti's concerto in D minor (No. 17) or M. Wieniawski's own Polonaise in A is the less interesting. The vocal music, given by Mrs. Osgood, Mdme. Patey, and the Crystal Palace choir, was excellent, both in selection and performance: special mention must be made of the concluding piece of the concert, Mendelssohn's great *Finale to Loreley*, in which Mrs. Osgood in the solo part sang with such dramatic power as to surprise her hearers, while both as regards band and chorus the rendering of the music was most satisfactory. This afternoon Herr Ignaz Brüll will make his first appearance at the Palace with his own concerto in C major.

At the Monday Popular Concert on Monday evening, Beethoven's great "Rasumouffsky" quartett in E minor, and Haydn's quartett in D minor, Op. 76, No. 2, were finely performed; Herr Joachim being the leader. The programme also included Schumann's great fantasia in C major, played by Herr Brüll, and two movements from one of Bach's violin sonatas, given by Herr Joachim. The vocalist of the evening

was Herr Henschel, who by his splendid declamation of Schumann's "Two Grenadiers" excited no ordinary enthusiasm among the audience.

To musicians of culture Mr. Walter Bache's annual concert is one of the most interesting events of the season. Even if it be impossible to feel unqualified admiration for the music of the Abbé Liszt, the pertinacity and enthusiasm with which Mr. Bache continues his efforts in the cause of his former preceptor must meet with due acknowledgment; and the opportunity annually afforded of making acquaintance with the works of a remarkable man never fails to bring together an audience composed of persons eminent in the musical world. The programme of Tuesday's concert was perhaps more modest than usual, inasmuch as it did not contain any actual novelties. Of Liszt the most important works were the "Fantasie über Ungarische Volksmelodien," for piano-forte and orchestra, and the fourth *Poème Symphonique*, entitled "Orpheus." Besides the fantasia, Mr. Bache played two trifles for piano-forte solo, and Beethoven's fifth concerto in E flat, Op. 73. Miss Anna Williams sang Liszt's *scène dramatique* "Jeanne d'Arc au Bûcher," and joined Mr. Maybrick in three two-part songs by Peter Cornelius. Mr. Manns conducted the orchestra of sixty-seven performers. The concert-giver was frequently recalled in the course of the evening, and at the close received an ovation which doubtless had more of sincerity than many of such compliments.

MR. DANNREUTHER has commenced a fifth series of performances of chamber music at his residence, 12 Orme Square. The first was given on the 14th inst., when Mr. Dannreuther was assisted by Messrs. Henry Holmes, Burnett, and Lasserre. Mozart's piano quartett in G minor, and Schumann's in E flat, were the most important works brought forward. At the second concert, next Thursday, a piano trio in E minor, by Mr. Hubert Parry, Saint-Saëns' Suite in D for piano and violoncello, Schumann's piano sonata in G minor, and Beethoven's great trio in E flat are promised. There are probably no concerts given in London at which so many novelties are to be heard as at these performances.

MR. ERNEST DURHAM's first piano-forte Recital was announced to be given at the Steinway Hall, Lower Seymour Street, on Wednesday afternoon. As we were prevented from attending, we can only say that the programme included Beethoven's "Waldstein" sonata, Schubert's fantasia, Op. 15, a selection from Bennett's Studies, and smaller pieces by Beethoven, Chopin, Weber, Liszt, Brahms and Raff.

At the Adelphi Theatre the *Merry Wives of Windsor* has continued to run during the week. We understand that the next work to be brought forward will be Brüll's *Golden Cross*.

MR. HENRY LESLIE'S Choir announce their first subscription concert for Tuesday evening next at St. James's Hall. One of the most interesting items of the excellent programme will be Bach's great motett for a double choir, "The Spirit also helpeth us."

MESSRS. PLEYEL, WOLFF AND Co., the well-known piano-forte manufacturers, have invented a piece of mechanism to which they have given the name of "The Transpositor," by means of which it is possible to transpose music played upon the piano into any key that may be desired. A separate set of keys is played over the keys of the piano, the two being connected by means of short rods. The additional key-board can then be shifted to right or left as may be desired.

THE first number of a new monthly paper, the *Bayreuther Blätter*, has been forwarded to us. It is to be the organ of the Wagner Societies, and more especially of the "Bayreuther Patronatverein," the object of which is to raise the needful funds for Wagner's new music school, and for performances on an adequate scale in the Bayreuth

"Festspielhaus." The editor is Hans von Wolzogen, and Wagner himself contributes to its columns. At the end of a very interesting introductory article, the composer promises the first performance of *Parsifal* for the summer of 1880 at Bayreuth.

LITERATURE.

A Statistical Account of Bengal. By W. Hunter, B.A., LL.D., &c., &c. (1875-1877.) In Twenty Volumes. (London: Trübner & Co., 1878.)

ACCURATE knowledge is necessary to secure efficient administration. It is because a Government is ignorant, because knowledge has not been collected by it, duly sifted and classified, and brought to bear upon current questions, that the progress of a country is checked and retarded. In India famines, barrenness from *reh* efflorescence, water-logged villages, and all other evils connected with British administration, are more or less due to want of accurate knowledge. It is ignorance, or insufficient information, which renders the most earnest attempts at improvement useless, and even harmful, and which prevents the adoption of effective measures for the welfare of a people.

Every Government, from the earliest ages, which has attempted to do its work has felt the necessity for accurate statistical information; and the first and least difficult part of the operation—namely, the mere collection of facts—has often been more or less thoroughly performed. A great enterprise of the kind was undertaken by the Spanish Government in their American colonies, and the preliminary work of collection was actually completed on a tolerably uniform system. Every parish priest was called upon to submit statistical information respecting his district on a pre-arranged plan, and a great mass of materials was thus brought together after the lapse of many years. But here the good work ended. In the classifying and final utilising of the collected materials the Spanish Government failed entirely. Herrera, and one or two other writers, had access to and dipped into this rich mine of information, and much of it still exists, buried and forgotten. For all useful administrative purposes the labour and money were wasted for want of an organising head.

A similar failure attended a like effort made by the English Government in Bengal, even during the present century. On the statistical survey of a single province the Government expended 30,000*l.* between the years 1807 and 1813, and this formed only one of a series of similar undertakings. A vast accumulation of materials took place, which was buried in different offices, useless either to the public or to the Government. Fifty folio volumes of manuscript and maps were sent home to the India Office, and there they were allowed to rot for thirty years without being touched.

The single attempt to use any of them was that which Mr. Montgomery Martin was unwisely allowed to make in 1838. He had never been in India, was unacquainted with a single Indian language, and destitute of any rudiments of the knowledge necessary to work up the manuscripts. Similar instances in other countries of attempts to collect and utilise information might be adduced, if our space permitted, which have failed from like causes.

The moral of these failures is that continuity must never be lost sight of. It is too often the case that as soon as one man has brought a section of useful work to a state of efficiency he is superseded, and his successor changes and pulls down, from a mere desire of self-assertion. This is the history of many and many a good beginning of useful work. Continuity is destroyed; and the fair edifice, which had been the work of years, is turned into a ruin in as many days. Unless the whole scheme is thought out from its commencement to its conclusion by one head, or else by men who appreciate the work of their predecessors, and preserve its continuity, expensive failures will continue to occur as often as great administrative schemes are undertaken.

It is seldom that one man is able to obtain the responsible charge of an important work sufficiently early in life to enable him to carry it through to completion; but when this does happen, the most essential requirement for success is secured in the best way. The appointment of Dr. W. W. Hunter as Director-General of Statistics to the Government of India was, from this point of view, an event of great importance. At length there was a prospect of a great scheme, the *Imperial Gazetteer*, being planned out, executed, and completed under the direction of one mind. What was a bright prospect in 1869 is now almost a certainty; and, numerous as have been the previous attempts, great as have been the talent and labour expended in former efforts, this will be the first time in the history of civilisation that a statistical work of like magnitude has been begun and finished by one and the same guiding mind.

Dr. Hunter brought to bear on the gigantic task before him a vigorous intellect, untiring zeal and energy, competent knowledge, and the rare gift of instinctive classification, which enabled him to sift with accuracy and precision, and to give each fact its proper place and due importance. Above all, perhaps, he knows the secret of obtaining work from others. His plan was to circulate a series of questions, and to have a local editor in each province, while he himself, by means of regular tours, exercised supervision and secured steady progress and fairly uniform execution of the work. By enlisting the co-operation of district officers and heads of departments throughout India, the materials were gathered in almost without cost, and, as compared with former attempts, with rapidity. The Director-General's own task was not, however, confined, in the first instance, to the collection of new information. His first duty was to collate and utilise the materials already existing, which are widely scattered in the

India Office, in Calcutta, Madras, Bombay, and in other depositories of archives. With these older materials an endeavour had to be made to arrive at the comparative statistics of the various provinces. The second operation was to gather in the information collected and prepared on a uniform plan in each district; and the third and last phase of the undertaking is to provide an organisation to work up the whole into an Imperial Statistical Account of India.

Such is the work upon which Dr. Hunter, with competent assistance, is now engaged. This statistical survey forms an epoch in the history of such enterprises. It will at length furnish a storehouse of trustworthy information, a benefit the magnitude of which can only be estimated by a consideration of the mistakes and losses which have been caused entirely by ignorance. Until the Government has a more full and accurate knowledge of the real facts of the country, and of the actual condition and requirements of its inhabitants, it will never obtain more than a half success in its efforts to render them happier and more prosperous. The great work will be completed in about four years from February, 1877.

Meanwhile the various provincial accounts have been completed, and that for Bengal and Assam is the work of Dr. Hunter himself. The basis of the work is the system of enquiries circulated to district officers, but this has been supplemented by special reports from provincial heads of departments, by papers on individual subjects, and by personal researches in the Bengal districts and among the manuscript records of the Government at Calcutta and in the India Office. The ignorance of the authorities before the preparation of these volumes may be measured by the results of the census of 1872 in Bengal. It was officially believed, before the census was taken, that the population of Bengal and Assam was forty millions. The total by the census amounted to sixty-six and three-quarter millions!

The *Statistical Account of Bengal* is the work now under review. It is one of the local accounts which will, when condensed and combined on a uniform system, form the *Imperial Gazetteer of India*. It consists of twenty volumes, each illustrated by a map, and the arrangement of the materials, for each district, is made on correct principles. The bases of statistics are space and number, represented in administration by the surveys and the census. These must, in correct classification, come first and remain separate as the foundation of all other investigations. Accordingly, Dr. Hunter's two first sections, in his account of each district, give the results of the surveys and of the census. In the first there is information respecting the physical and political geography and the general aspect of the country; and the second treats of the population under the various heads of the Census Report.

The next great divisions dependent on space and number as bases are those which treat of economic and social statistics. The former are included under the two heads of production and distribution. Production comprises the subjects of agriculture, forests, fisheries, mines and manufactures. Distribution treats of means of communication, fairs

and markets, trade and commerce. Social statistics embrace all information bearing on the condition of the people; and finally, administrative statistics furnish particulars respecting the revenue and expenditure, courts of judicature, education, postal and other Government arrangements for the benefit of the people, and police.

The third basis of statistics, combined with the elements of space and number, is that of time, by which comparisons may be made between different periods. The final objects of such work as that of Dr. Hunter have been well summed up by Sir Stafford Northcote, in an address delivered some years ago. It is only when facts have been accumulated in sufficient numbers that the laws which govern them can be studied, and conclusions can be derived from them. These laws are the law of stability, which teaches us to deduce from the observation of particular phenomena general conclusions as to the regularity of their occurrence; and the law of variation, pointing out in what manner, and within what limits, the conditions of human life and the current of human action may be modified or controlled by man. The administrative as well as the scientific value of these laws is proved by the sensitiveness of statistical facts to the influence of real and unmistakeable causes which ought, *a priori*, to influence them. Eventually statisticians look forward to being able to describe the economic and social conditions of different parts of the world as precisely and specifically as geographers can describe their physical aspects. Dr. Hunter's *Imperial Gazetteer* will be, without any comparison, the grandest contribution that has hitherto been made towards this end.

But the reader will be much mistaken if he supposes that the statistical accounts of the Bengal districts are merely a dry array of facts. They are prepared with that literary skill and power of description of which the author of *Annals of Rural Bengal* and of *Orissa* is well known to be a master. Every volume contains pleasantly-written information which will be found interesting to numerous classes of enquirers; but we only have space to indicate a few of these. In the first volume we have a most graphic and lifelike description of the great alluvial islands forming the southernmost portion of the Gangetic Delta, and known as the Sundarbans. In the volume on the Bardwan Division there is a comprehensive history of the coal industry in the Raniganj district, including an account of the method of working the coal, and other details. In others we have similarly prepared histories of tea-cultivation, of the development of the jute industry, and in all there are interesting details respecting the daily life of the people, their means of subsistence, and the calamities to which they are exposed. As a literary work, apart from its excellence as a storehouse of facts, the *Statistical Account of Bengal* takes high rank.

In conclusion we must allude to the great service which Dr. Hunter has performed in establishing a uniform system of spelling native names. No one can fully appreciate the difficulty of the task who has not himself had to encounter the innumerable delays and petty obstructions of a public office, when anything outside the ordinary routine

is attempted to be done; but all who have studied Indian subjects must have felt the evils of that wild confusion into which the orthography of native names has fallen, owing to the absence of any system. Recent Government orders, due to Dr. Hunter's persevering efforts, have established a uniformity which the *Imperial Gazetteer* will, in another generation, make permanent.

CLEMENTS R. MARKHAM.

Gérard de Nerval. *Poésies complètes.*
(Paris: Calmann Lévy, 1877.)

It is now for the first time, nearly a quarter of a century after his death, that the poems of Gérard are collected. In the general resuscitation of the poets of 1830 the sweetest figure and the most winning has been forgotten. The fame of his prose has a little extinguished the reputation of his verse: his matchless *Voyage en Orient* has taken a place among the French classics, and bibliography has neglected the rest of his writings. His dramas have never been reprinted, many of them not even printed; his *Le Prince des Sots*, the blue rose for which M. Charles Asselineau was always searching, is still undiscovered, and perhaps no one is fit to find it now the best of bibliographers is dead. Gérard de Nerval's best story, "Sylvie," is only to be found, or I am much mistaken, in the body of the *Revue des Deux Mondes*. That the present volume is what it professes to be, the complete collection of his poems, can, surely, in no sense be true. Where is the series of mystical sonnets which he published under the title of *Vers dorés*, by the side of which, we are assured, Lycophron is limpid and the Orphic Hymns a book to run and read? Unless, indeed, they are the mystical but not extremely obscure sonnets here entitled *Les Chimères*. But the wayward practice Gérard affected of burying his best writings in obscure journals, and even under a succession of such pseudonyms as Aloysius Block and Fritz, makes it probable that much has evaded the present editor, who shows no great skill in bibliography.

Gérard de Nerval was the assumed name of Gérard Labrunie, who was one of the leaders of *Le petit Cénacle*—that band of enthusiastic youths roused into poetic life by the early writings of Victor Hugo. Gérard was the first of all these younger writers to make a reputation. When he was barely out of his sixteenth year, in 1826, he brought out a slender volume of *Poésies Politiques*, in which the manner of the master, first revealed four years before in the *Odes et Ballades*, is sufficiently marked. In 1827 he essayed a bolder flight in the *Élégies Nationales*, dedicated to Béranger, published at the moment when the liberty of the press was being discussed, and full of ardour and confidence.

"Je ne suis plus enfant: trop longs pour mon envie,
Déjà dix-sept printemps ont passé dans ma vie.
Je possède une lyre,"

and the public consented to acknowledge that the precocious lad knew the art to strike it rousing. In 1828 he published his elaborate translation of *Faust*, a work that has survived all later rivals, and which called forth from Goethe himself an expres-

sion of the warmest recognition. The youth of eighteen was one of the most renowned persons of the hour, and the newspapers rang with his praises, when the names of Gautier, of De Musset, and even of Pétrus Borel were still utterly obscure. This brilliant success he bore with the most unaffected simplicity, and even with indifference; the only use he made of it was to form a bond of union between his less famous friends and the influential journals, who were glad to accept their contributions at his recommendation. He himself was averse from publicity, unambitious after the first successes of youth, and too restless to settle down into Parisian life. He was much addicted, like all the circle, to the romantic literature of Germany. He devoted himself to Hoffman and Jean Paul, and after a while he passed into the country itself, the more thoroughly to steep his thought in Teutonic fancy. Through German thought he became influenced by the mysterious attraction of the East, and at last wandered away alone into Egypt and Syria, where he leisurely adopted the life of one Oriental people after another, and laid up the store of experience with which he afterwards filled his most fascinating and most memorable book. But it was not his nature to be at rest; he took his life in swallow-flights, and he came back to Paris, no less gentle, no less unselfish, but sadder, and with a more wistful isolation of character. His strange and beautiful life came to a most sinister conclusion, in the month of January, 1855, when he hanged himself early one morning in the Rue de la Vieille Lanterne, in the forty-seventh year of his age. He had for some time past shown signs of insanity, and had even been placed for his safety in the house of a physician; his friends were therefore not wholly unprepared for the terrible news, which occupied Paris for a week.

As is often the case with the actual verses of a man of immense personal influence, the poems collected in this volume do not fully account for the vast reputation of Gérard among his friends. Théophile Gautier has left a study of his person and character which is among the most admirable portraits of that great master of description. It presents us with the figure of a thoroughly poetical and original person, whose actions, words, and even movements, proved his imaginative individuality as much, perhaps even more, than what he wrote. With a little more external mediocrity, Gérard de Nerval might have written better. But his life was poetic; he moved in a rich dream, and after his early youth was over he lacked the stimulus of ambition or of vanity. His poems, as they are here presented to us, seem to belong to two entirely different periods: the first closing about 1831, and distinctly attributable to the Romanesque movement; the second extending from about 1842 to his death. In the former we see, by slight indications, how ready and how skilful he was to adopt the glowing innovations of his contemporaries. The exquisite verses called "Politique" (p. 225), with their melancholy longing, as of an imprisoned bird or soul, for the life of leaves and for the open air, are no less admirable

in form than treatment. Such a descriptive stanza as this, from "Avril," shows a realistic force and talent hardly surpassed, at the time of its composition, by Victor Hugo himself.

"Déjà les beaux jours, la poussière,
Un ciel d'azur et de lumière,
Les murs enflammés, les longs soirs;
Et rien de vert; à peine encore
Un reflet rougeâtre décore
Les grands arbres aux rameaux noirs!"

In his latest poems, particularly in the curious cycle of sonnets *Les Chimères*, his style is more powerful, but stranger and more grotesque. Perversity was the order of the day. Baudelaire was about to reveal himself, and these sonnets prophesy, at least in their mystical and violently modern tone, of *Les Fleurs du Mal*, which first appeared about three years after the death of Gérard de Nerval. Of *Les Chimères* the most graceful and the most sonorous appears to me to be the following, in which the subtilty of the thought interferes in no wise with the luminous and delicate form.

"La connais-tu, Daphné, cette ancienne romance,
Au pied du sycomore, ou sous les lauriers blancs,
Sous l'olivier, le myrte ou les saules tremblants,
Cette chanson d'amour . . . qui toujours recommence?"

Reconnais-tu le temple, au péristyle immense,
Et les citrons amers où s'imprimaient tes dents?
Et la grotte, fatale aux hôtes imprudents,
Où du dragon vaincu dort l'antique semence?
Ils reviendront, ces dieux que tu pleures toujours!
Le temps va ramener l'ordre des anciens jours;
La terre a tressailli d'un souffle prophétique . . .
Cependant la sibylle au visage latin
Est endormie encor sous l'arc de Constantin:
— Et rien n'a dérangé le sévère portique."

We part with a certain vague disappointment from a volume to which we have long looked forward, and which might, we cannot but suspect, have been, with a little care, made far more important than it is.

EDMUND W. GOSSE.

The Encyclopædia Britannica. Ninth Edition. Vol. VII.—DEA—ELD. (Edinburgh: Adam & Charles Black, 1877.)

THE publication of this magnificent encyclopædia steadily continues at the rate of two volumes in the year. The first volume appeared towards the close of 1874; and now, after an interval of three years, we have received the seventh instalment, which carries us half-way through the letter E. From these data we may reasonably anticipate that the whole will be completed in about twelve years from the commencement, filling twice as many volumes. The enterprise of the publishers, and the labour of the large staff engaged upon the work in its various branches, may be imperfectly realised when we add that each volume contains more than 800 double-column pages of quarto. It is but right to draw attention to this aspect of the undertaking, as the public are naturally disposed to look only to the quality of the longer articles, and not award sufficient gratitude to the bold venture of capital and the editorial skill which are no less necessary conditions of success. Having said so much, we may be allowed to reiterate an old grievance on a point of petty detail—that the printers are unpardonably inattentive to the due insertion of full stops.

The most important article in this volume is that on "Egypt," which occupies more than one-tenth of the whole. It is assigned to Mr. Reginald Stuart Poole; but to some extent it may be regarded as a joint production of the eminent family who have devoted themselves to the study of things Egyptian. *The Modern Egyptians*, by Mr. Lane, first published in 1836, and *The Englishwoman in Egypt*, by Mr. Lane's sister, Mrs. Poole, have never been superseded as standard authorities for the social life of the people. In addition to these books, use has been made of Mr. Lane's unpublished "Description of Egypt;" and beneath the historical sections are subscribed the initials of Mr. Edward Stanley Poole, and his son Mr. Stanley Lane Poole. The result of this loyal co-operation is a most exhaustive account of a country which in its language and its antiquities constitutes a department of science by itself. The early chronology is treated with not a little scepticism—an attitude which we do not presume to criticise—and the events of the Mohammedan period are chronicled at great length. It must be through an oversight that a paragraph on p. 742, regarding the judicial reforms of Nubar Pasha, is repeated, almost *verbatim*, on p. 767. The article on "Denmark" is contributed by Mr. E. W. Gosse. In the section giving a sketch of Danish Literature, we recognise the combined knowledge and felicity of style which are displayed by the same writer in such minor notices as those of "Drayton" and "Donne." But *non omnia possumus omnes*. The main portion of the article contains a few blunders, not so much of fact as of compilation. The entire paragraph dealing with the agriculture of Denmark has somehow got involved in confusion; and that on government exhibits a palpable contradiction, due evidently to the incorporation of a line from the last edition. Of the remaining geographical titles, "Edinburgh," county and city, is treated with the fullness that we should have expected; "Devonshire" will scarcely satisfy the enthusiasm of west-countrymen; "Dumfries," on the other hand, to adopt a Scotticism which has twice offended us in reading the volume, "bulks" too largely for the comparative importance of a town with 13,000 inhabitants.

The articles dealing with the Sciences and the Arts are as numerous as usual. We can only enumerate a few of the more prominent. "Elasticity" is written by Prof. Sir William Thomson; "Distribution" conjointly by Mr. A. R. Wallace and Mr. W. T. T. Dyer; "Diagrams" and "Diffusion" by Prof. Clerk Maxwell; "Earth" by Col. A. R. Clarke; "Echinodermata" by Mr. F. H. Butler. In "Diving" and "Dredging" Mr. D. Stevenson again brings his personal experience to bear upon the elucidation of subjects which require some adventurous attraction. We notice that the article on "Eels" repeats the exploded story, first popularised by Humboldt, that the Indians capture *Gymnoti* by driving horses into the ponds in order to exhaust their electrical power. (See the *ACADEMY* for September 8, 1877, p. 252.) The theological contributions will not invite so much notice as some

that have appeared in earlier numbers. "Deluge," by Mr. Cheyne, may be commended to the attention of the Dean of Westminster, who recently animadverted upon the fashion in which this heading is slurred over in Smith's *Dictionary of the Bible*. It should be read as supplementing the article on "Cosmology" by the same writer in the last volume. "Decalogue," by Prof. Robertson Smith, gives a critical summary of the opinions that have been held on the "Ten Words;" and "Ecclesiastes," by Dr. Ginsburg, re-states the interpretation which the writer published in 1861 in his *Cohemoth*, commonly called the *Book of Ecclesiastes*. Prof. Candlish, under the novel title of "Dogmatic," argues at some length for the claims of his subject, as a study independent of Biblical theology and the science of religion: but it is significant that he fails to find a single representative for it among English theologians. Philosophy proper is conspicuous by its absence. This would not have been the case if Prof. Caird had not anticipated the metaphysics of Descartes in his article on "Cartesianism" in the fifth volume. The ground having been thus partially pre-occupied, Mr. W. Wallace was compelled to concentrate himself on the narrower field of biography, to which he has added a sketch of the physical speculations of the great French *savant*. It is no small praise that he has been able to clothe with interest these less attractive departments of his subject. Without any parade of erudition he tells us probably all that is to be discovered about the incidents of Descartes' early career of campaign and travel, and his subsequent seclusion in Holland; while he expounds the celebrated theory of vortices with more sympathy than might have been expected from an Englishman of the present age. Mathematicians, perhaps, will be disposed to claim for themselves a larger part in the founder of modern analytic geometry.

The second longest article in the volume is that on the "Drama," by Prof. A. W. Ward—a storehouse of learning on the history of dramatic literature and the stage in all countries. The writer is disposed to regard with despondency the future of the drama in England, "so long as there is no national theatre removed above the conditions of commercial speculation." One of James Mill's best-known contributions to previous editions of the *Encyclopædia Britannica* was his essay on "Education," which possesses for us the additional interest of developing the theory exemplified in the person of John Stuart Mill. The present article, by Mr. Oscar Browning, is confined to an historical review of the educational systems that have been put before the world at various times. The change of treatment is characteristic of an intellectual tendency of our generation which is everywhere conspicuous in these pages. Ours is an age not wanting in appreciation for the labours of its predecessors, but it seems to have lost their freedom of original speculation. Our point of view is turned backwards rather than forwards. The attitude of criticism has superseded the enthusiasm of constructive genius. In justice, however, to Mr. Browning it should be added that he obscurely

promises a disquisition on Paedagogy or the science of teaching under another head. There is appended to his article an outline of the law relating to primary instruction in the United Kingdom, but no programme of our educational institutions and no comparative statistics.

Among miscellaneous articles may be mentioned "Drawing," by Mr. Hamerton; "Dietetics," by Dr. T. K. Chambers; and "Drunkenness," by Dr. G. W. Balfour, which last reads like a scientific apology for the national vice, which is not least prevalent north of the Tweed. "Demonology," by Mr. Tylor, and "Dream," by Mr. Sully, are both discussed from a point of view with which the writers have already made us acquainted. In the department of Biography the names of men of letters predominate over all others. In the same class with the article on Descartes already referred to we would place "Dürer," by Prof. Sidney Colvin; "Dickens" and "Dryden," by Mr. Minto; and "Defoe," by Mr. Saintsbury. Prof. Jebb contributes an estimate of Demosthenes; and Mr. J. Morley has but too briefly indicated the chief features in the literary career of Diderot. The Lives of the Earls of Derby and Dundonald are written by Mr. W. Browning Smith, whose death we regret to have noticed between the appearance of the volume and the publication of these lines. JAS. S. COTTON.

Masters in English Theology; being the King's College Lectures for 1877. (London: John Murray, 1877.)

WHETHER regarded as a contribution to history or to theology, the above admirable series of lectures well deserves a careful study. It is not often that six writers of acknowledged ability and ripe attainments are to be found contributing to a volume of such modest dimensions; it is still more rarely that instruction conveyed in such a form embodies so much valuable criticism and unconventional treatment of the several subjects.

The main object, common to the whole series, has been to place before the student the distinctive merits of the different great writers successively discussed, viewed mainly in relation to the communion they adorned. In order to bring out this relation more clearly, an Historical Preface from the pen of Canon Barry has been prefixed, which explains succinctly, but very lucidly, the conditions that served to modify our Anglican theology from its first exposition at the hands of Hooker, as the doctrine of a "Reformed branch of the ancient Catholic Church," to its more systematic and scholastic treatment by Bishop Pearson.

The language employed by Dr. Barry, both in the Preface and in his lecture on Hooker, when speaking of the English Church, recalls somewhat forcibly that in which some of our ablest writers, from Burke to Mr. Freeman, have described the English Constitution—as a polity resting on precedent, exhibiting through all its modifications much of the ancient structure, and incorporating reforms and innovations by a gradual process which, if involving not a few anomalies, can at least plead in

its defence that it has resulted in the preservation of the original edifice, while many a more symmetrical and pretentious design has risen only to collapse and disappear. "Englishmen," says Dr. Barry, "have always preferred the recognition of all the facts of any case, however irreconcilable they may seem, to the sacrifices which a perfect logical system invariably demands, before it can square to its required limits the complex variety of human nature and human life." And so the English Reformation was "a growth, not an artificial formation—having all the irregularities and imperfections of a natural development, but having also the secret of permanence, in virtue of its adaptation to the character and progress of the English people." In like manner, Dean Church admits that Andrewes and his school could not hide from themselves that their Church was an anomaly, but then "it was only an anomaly among anomalies—amid universal anomaly" (p. 108)—"an irregular and inconsistent fabric," again to quote Dr. Barry, which the English genius deliberately preferred to "the squared and compacted fortress of Calvinism" (p. 17). So, again, the great work of Hooker, while deriving its chief value from the masterly exposition of first principles which it embodies, exhibits also its peculiar adaptation to the national mind by the manner in which it treats of Christianity "as concrete in individual and corporate Christian life" (p. 18). Much that serves to render Hooker's whole conception more intelligible, and specially to vindicate it from the imputation of absolutist tendencies, will be found cogently and tersely expressed in this able lecture.

The next lecture, that on Andrewes, will, however, probably be generally recognised as the most important of the series. Dean Church has here chosen for his theme a subject which he has evidently studied with special care, and sought to set in a somewhat new light. Language that classes Andrewes as a Reformer, and speaks of the Reformation as still going on in 1662, will, indeed, appear strange to many readers; but nothing is of more importance, in endeavouring to form an estimate of our seventeenth-century theology, than to understand the difficulty under which those leaders of the English Church laboured, who, while maintaining her historical affinities with the past, were at the same time painfully conscious of the void created in the hearts of many by the renunciation of mediæval traditions. To the desire to find at least a partial substitute for the foremost of those traditions, that of a universal Head of Christendom, we may refer, in a great measure, the exaggerated theory that arose of the relations of the Crown to the Church—a theory which was "partly a very real and natural idea at the time; partly a factitious and scholastic one," while it "partly expressed, vaguely and imperfectly, the claims of public law" (p. 83). In the controversy in which, at the instance of King James, Andrewes reluctantly engaged with Bellarmine and Duperron, those giants of Ultramontane erudition, he approved himself a worthy champion of the Anglican cause, and, from his standpoint, was able to accept the chal-

lenge—to which neither Luther nor Calvin nor Whitgift could have responded with equal confidence—which invited him to submit the relative merits of the Roman and the Reformed Church to the test afforded by a comparison of their respective agreement with the Church of St. Augustine and the first four Councils. The skilful analysis by which the loftiness and comprehensiveness of Andrewes' theology are brought out in strong relief when contrasted with the rigid systematising of Calvinism on the one hand, and with the narrow formalism of Laud on the other, constitutes this study a distinct advance on anything that has hitherto appeared on the subject. There is a singular slip on page 98, in referring to an opinion expressed by Clarendon as to the measure of success that might have attended Andrewes' administration had he been appointed to succeed Abbot, where Bancroft is obviously intended—an inadvertency which sets us pondering on what might not indeed have happened if Andrewes had lived on to 1633 to be Archbishop instead of Laud, and the policy of the English Church for the next twelve years had been guided by his humane spirit and lofty intelligence.

The lecture on Chillingworth is much shorter, but is of considerable interest. It offers, in most respects, a marked contrast to the highly eulogistic tone that characterises Principal Tulloch's sketch in his well-known *Rational Theology in England*. In estimating the *Religion of Protestants*, whether regarded as a literary production or a theological tractate, Dr. Plumtre employs much more qualified language. "The book," he says, "is essentially the work of a second-rate, not of a first-rate, thinker; of a mind logical, acute, disputatious, but not endowed with the 'vision and the faculty divine' which gives width and equilibrium, and order and lucidity" (p. 120). Chillingworth's celebrated dictum, "the Bible the religion of Protestants," is characterised as "a perilous epigram," to which neither Butler nor Hooker would ever have given utterance; and his uncritical mode of looking on the Bible as a whole, "in which a text is a text wherever it may be found," is censured, not merely as a method of interpretation which has been abandoned by the wider knowledge of later times, but as one which, when compared with the more discriminating views represented by Erasmus and Grotius, was reactionary in tendency. After directly expressing his dissent from the concluding sentence of Principal Tulloch's criticism—that "there are few names, even in a history so fruitful in great names as that of the Church of England, which more excite our admiration, or which claim a higher place in the development of religious thought"—Dr. Plumtre equally demurs to Locke's high encomium of the *Religion of Protestants* as supplying an admirable disciplinary exercise for the reasoning powers, holding that "young minds need the guidance of a calmer and more evenly balanced intellect than that of one who is neither thorough, nor consistent, nor complete—whose whole life was a series of disputes and oscillations, ending in retrogression" (p. 143).

In "Jeremy Taylor" Canon Farrar's rhe-

torical and descriptive powers find a congenial theme. His treatment, however, differs somewhat from that of the rest, his sketch resembling rather a contribution to a popular serial than a lecture to students. It brings before us very vividly the main facts in Taylor's life, and the characteristics of his genius, but gives no very definite conception of any one of his great works. Canon Farrar, indeed, is so lost in admiration of Taylor's brilliant imaginative powers that he almost declines to criticise, and seems to hold that in productions of so much splendour we have no right to postulate "the rigid scrupulosity of precisely accurate reasoning and definition;" while he sets aside the objections of more than one able writer to Taylor's claims to rank as a thinker as "the pedantries of formal criticism."

In "John Pearson" Canon Cheetham essays the far more difficult task of investing with corresponding interest the character and writings of the judicially-minded author of the *Exposition of the Creed*—"a school-man," as he describes him, "with the scholarship of the Renaissance." Few probably who have studied the *Exposition* have been aware how much the author was indebted to Thomas Aquinas; and this lecture is especially valuable for the clearness with which it brings out the more important influences of scholasticism on our Anglican theology. It is well deserving of note that Baxter, who undervalued the school logic, was yet fain to confess that among those of the opposite party at the Savoy Conference, Pearson approved himself "the true logician and disputant," disputing "accurately, soberly, and calmly." If we compare with this Baker's judgment on Baxter himself on the same occasion—when he says that "Mr. Baxter, who knew nothing of an university, nor was acquainted with any other chair save that of the pulpit, only in the strength of natural logic ventured to engage in mood and figure with some of our best and most experienced divines, with such success as usually attends rash undertakings" (*Life of Anthony Tuckney*, i., 231)—we may perhaps conclude that the old scholastic disputations had their uses after all.

It is a little to be regretted that (owing probably to the necessity for brevity) these lectures do not include more frequent references to contemporary or preceding thought. For example, the influence of Dailé's "epoch-making" treatise, just glanced at by Dr. Farrar (p. 193), *De l'emploi des saints pères, &c.*, which appeared in 1632, was potent both on Chillingworth and Taylor, a fact strongly insisted on by Warburton in the Preface to his *Julian*, and one which accounts for many striking resemblances between the *Religion of Protestants* and the *Liberty of Prophecy*. Considering, again, the frequency with which points of contact between the scholastic and the Anglican theology here offer themselves to our notice, it might have been of service if Dr. Westcott, when describing the belief that "there is nothing true in divinity which is false in philosophy, or the contrary," as "the burden of Whichcote's lesson," had taken occasion to inform his hearers how pre-eminently this was a scho-

lastic idea, taught from the time of John Scotus in the ninth century down to Roger Bacon, the Franciscan friar, in the thirteenth, and enunciated in 1277 as a doctrine of the Church by Etienne Tempier, the Chancellor of the University of Paris. In fact, as Kleutgen appears to have satisfactorily established in his *Philosophie der Vorzeit* (I., ii.), the "Ketzerrei von der doppelten Wahrheit" was never fairly chargeable on any of the Schoolmen, but was an idea started by their great enemies, the New Aristotelians in Italy, at the commencement of the sixteenth century, to be rehabilitated, as Dr. Westcott observes, by Hobbes and Bacon in the seventeenth.

J. BASS MULLINGER.

Upper Egypt: its People and its Products, &c.
By C. B. Klunzinger, M.D. With a Prefatory Notice by Dr. Georg Schweinfurth.
(London: Blackie & Son, 1878.)

THIS is a very different kind of book from those given us lately by Mr. de Leon and others, describing the Khedive's Egypt as it exists in Cairo and Alexandria. It relates to the *campagna*; to the littoral of the Red Sea; to the villages and the small towns; to the general aspect and to the minute natural history of the section of country to which it relates. Dr. Klunzinger, with a break of three years, lived from 1863 to 1875 in Egypt, chiefly at Koseir, but also in the neighbouring portion of the Nile valley corresponding to the ancient Thebaid; and he lived among the people, learning their language and studying their customs. He does not do so himself, but the author of *The Heart of Africa* compares his book with the similar work by "Lane of blessed memory," the difference being that, while they both lived almost entirely among the Egyptians, Lane occupied himself in the main with such conditions of life as exist in a large town only, while Klunzinger goes into small towns and into the country. But the title *Upper Egypt* is now a misnomer, and one calculated to mislead. Technically it is correct enough; but when Upper Egypt is spoken of nowadays we at once think of the regions beyond Nubia, stretching up to the Lake country, and not of a district within 300 miles of Cairo and 100 of the upper part of the Red Sea. The vast territory and innumerable tribes of what constitutes the Upper Egypt of our day are untouched by Dr. Klunzinger, whose experience was drawn from a very small and tolerably familiar part of Egypt. The comparison of this book with the *Manners and Customs of the Modern Egyptians* is rather an unfortunate one, because Lane opened up an almost entirely new subject with which that of our author is very nearly identical, notwithstanding the difference between town and country; and a considerable part of the information which both present is almost of necessity identical. We must also say that a good many of the descriptions furnished by Dr. Klunzinger are very old friends. In a work which professes to give, and does give, a view of the *vie intime* of a section of Egypt, it was quite unnecessary to give us a full-length portrait of the donkey-boy again, or descriptions of the Turkish bath and of the obstacles to riding

through Egyptian streets. There are even five closely-printed pages devoted to directions to the traveller as to how to saddle and mount his camel, which directions read uncommonly like Captain Burton's advice to Mr. John Bull on the same subject, only with the fun left out. Some subjects are treated with a detail which becomes uninteresting and is of no use, while others are passed over: as when we are told of the quarrels of the men without any account of the far more vehement and picturesque quarrels of the women which may be witnessed in the by-streets of any Egyptian town or village.

At the same time we must say that this is a readable and interesting book. Its author knew well the people he describes, and contributes to our knowledge of them in a pleasing style. Thus, for instance, in going up the Nile he takes us into a native passage-boat, and describes the voyage made there, with its characters and incidents; and this is followed by accounts of a Nile village, of the methods of agriculture, of the seasons, of the field and garden plants, of wild plants, of the animal world, and so forth. There is similar information in regard to the vessels of the Red Sea, even the mariner's lute being described, and the Arabic terms of his calendar explained. The practical chapter on this subject is useful, and there is also an interesting chapter on the natural treasures of the Red Sea, in which even P. and O. passengers might find a good deal to instruct and amuse them, and a chapter which might be of special value to those delayed at Suez or Aden. Indeed, this seems to me the most fascinating part of the book. Dr. Klunzinger may not be more at home when standing on a coral reef than when in an Egyptian village, but he has certainly more interesting facts to tell us, and facts which will be more novel to the ordinary reader.

What is to be gathered from this book is entirely in line with the accounts of all competent observers of the Mohammedan world, not only in this century but for two centuries back. Its general result is very well put by Dr. Schweinfurth—himself one of the highest authorities on the subject—when he says, speaking of the ruling classes as contrasted with the Fellahin:—

"Here we see men without character, without national feeling, without conscience, from cowardice as incapable of crime [?] as from mean-spiritedness they are incapable of any noble actions. But we should be guilty of manifest injustice in judging of the character of the people were we to allow our disgust for a class to set us against the whole. . . . The Fellahin are only to be compared with the dregs of our lowest social strata; and looked at from this point of view they cannot but appear to us worthy of admiration. Deprived of almost all means of self-cultivation, and without any pattern of morality above them worthy of being imitated, they grow up quite like savages; nevertheless we see them excelling in several virtues which only the wisest amongst us practice."

Such conclusions have often been forced upon me in the East; and they are adopted by the most temperate-minded of our observers and have the support of such great travellers as Mungo Park, Livingstone, and

Cameron. A pessimist would use them only to show how the evil spirit of existence must employ a modicum of good in order to make existence possible; and he would compare the governing class of Egypt with the governing power of the universe. But from a practical, common-sense point of view, Dr. Schweinfurth's distinction is apt to be misleading; for the vices of the rulers of Egypt are inextricably intermixed with those of its people, and, as a mere matter of fact, any improvement which has occurred in Egypt within the century has come from its higher rulers, or from strangers who elevated themselves into high positions like Mehemet Ali, and not from its own people.

ANDREW WILSON.

The History of Antiquity. Translated from the German of Prof. Max Duncker by Evelyn Abbott. Vol. I. (London: R. Bentley & Son, 1877.)

AN English translation of Prof. Max Duncker's *Geschichte des Alterthums* is very welcome; it has had the advantage of the author's own supervision and correction, and so may be regarded as embodying his latest and most mature opinion. The first volume of the English translation, which has as yet alone appeared, deals with the history of the leading nations of the ancient East, with Egypt, with Babylonia and Assyria, with the Phoenicians and the Hebrews, and with the inhabitants of Asia Minor. It is here more than anywhere else that our knowledge has been so marvellously enlarged by the discoveries and criticism of the last half-century. The monuments of Egypt and Assyria, the inscriptions of Babylonia and Phoenicia, the untiring efforts that have been made to determine the date and meaning of the Hebrew records, have revolutionised the history of the past and carried us back to the cradles of culture and civilisation. Much no doubt still remains doubtful; breaks still occur in the evidence, which have to be connected by uncertain conjecture, and the harvest that has already been gathered is but an earnest of what is yet to come. But sufficient materials have nevertheless been collected for the use of the historian, and Prof. Duncker's *History of Antiquity* reads like the discovery of a new world when compared with the meagre and legendary manuals which passed as ancient histories but a few years ago.

Not that all his statements and conclusions can be accepted as final or regarded as beyond criticism. Prof. Duncker does not profess to be more than an historian, whose task it is to weigh and combine the facts presented by the philologist and decipherer. He is obliged to depend upon others for his knowledge of the inscriptions and the tale they tell, and to rely upon the judgment of experts for the authorities to whom he should trust. Unfortunately the decipherment of the Egyptian or Assyrian monuments has sometimes been taken up with more zeal than knowledge, while the progressive and tentative nature of the study necessitates perpetual revision and modification of opinion even on the part of qualified scholars. Hence the historian who is unable to control the reading of the inscriptions

and the theories of their decipherers is in a peculiarly difficult position and needs more than ordinary caution and skill. Prof. Max Duncker, with all his historical ability, has not always been able to keep clear of unfounded combinations based on erroneous or questionable statements. Thus he accepts Mordtmann's interpretation of the Vannic inscriptions, and takes from him the name Bagridur as that of the Minnian king who the Assyrian monuments show us was really called Sar-duri or Seduri. Thus, too, his readings of Babylonian proper names are frequently antiquated—as when he calls Dungi *Ilgî*, or speaks of "Uruk" and "King Sarruk." The latter, however, is probably a misprint for Sar-yucin (Sargon), though the name does not mean "strong is the king," as Duncker asserts, nor is there any inscription which ascribes to Sar-yucin the foundation of Agané.

It would not be worth while to notice trifling flaws like these were the book not of such sterling value as a whole. Nowhere can a better and more interesting history of the ancient East be found, or one in which every opportunity has been seized of utilising the latest discoveries. Instead of a long list of aimless wars and unfamiliar names, we have short but clear sketches of the political histories of the great nations of antiquity, in which the main points of interest and importance are alone dwelt upon; while other chapters are filled with the even more important history of art and religion, of science and manners, which has made the revelations of Egypt and Assyria of such moment to us of to-day. In short the volume before us tells the general reader how the Egyptian or Babylonian of a remote past lived and thought; it traces the growth of civilisation, and sets before us the long-forgotten culture from which both Jew and Greek learned so much. Egypt and Babylonia live again in their monuments, and the facts these have already been made to yield only need an accomplished historian, such as Prof. Max Duncker has shown himself, to combine themselves into a connected story and a revelation of strange interest. Six thousand years ago Egypt was already a civilised power, standing like a solitary pharos amid the darkness of surrounding barbarism, with an organised government, an extensive literature, and a developed art. The art of the Old Empire, indeed, reached a higher point than that of any subsequent period, and the history of Egyptian art, like the history of a good part of Egyptian civilisation, is a history of continuous decline. Babylonian civilisation cannot claim so great an antiquity, though its beginnings must be sought more than thirty centuries before the Christian era. It was the creation of a race speaking an agglutinative language and allied, it may be, to the Finns and Turks of the present day, and from them it was borrowed and improved by Semitic tribes. As in Egypt, so too in Babylonia, writing began with pictures of objects and ideas, which gradually passed into characters that bore little or no resemblance to the primitive forms. Libraries were founded in the Chaldean cities and stored with books on papyrus and clay, astronomy and mathematics found their first students, and law be-

came a recognised profession. That "there is nothing new under the sun" is a truth which is constantly being impressed on the Assyrian and Egyptian scholar. The more we know of the nations of the ancient East, the more like to ourselves they seem to be, the more their civilisation is seen to resemble our own. The Greeks were indeed but children, as the priest of Sais told Solon; while they were still the rude barbarians whose remains have been preserved under the lava-beds of Thera, nay, long before they had reached the shores of the Mediterranean or even, perhaps, before they had left their early Asiatic home, great empires had risen and declined, great civilisations had grown and faded, of which they, like ourselves, were the heirs and successors. The first volume of Prof. Duncker's *History* reads like a page torn from the annals of another planet, so strange does it sound to those whose historical vision has been bounded by the classics of Greece and Rome. But it is beginning to be recognised that we cannot understand Greece and Rome without understanding that which went before them and the men into whose labours the Greek and the Roman entered. "Westward the course of empire takes its way;" and so, too, does the course of civilisation and the education of mankind.

The translation has been well and conscientiously performed, and but one fault can be found with it. It is a pity that the translator did not ask the aid of an Oriental scholar in the transliteration of proper names. The German *ch*, for instance, is retained in words like *Ohufu*, *Chafra*, *Cheta*, where the English reader will naturally give it a wrong pronunciation; and the German *sch* is written instead of *sh* in words like *Schasu*. Then there are downright mistakes, like *Kaldiai* (p. 257) for *Kaldai*. In a second edition, which we hope the book will soon reach, these mis-spellings may easily be corrected.

A. H. SAYCE.

NEW NOVELS.

In Love and War. A Romance. By Charles Gibbon, Author of "In Honour Bound," &c. In Three Volumes. (London: R. Bentley & Son, 1877.)

Under the Will: and other Tales. By Mary Cecil Hay, Author of "Old Myddelton's Money." In Three Volumes. (London: Hurst & Blackett, 1878.)

A False Step: or, Real Life in Australia. A Tale in One Volume. By Marc. (London: Remington & Co., 1878.)

A FULL acquaintance with Scottish history, and no small knowledge of the Scottish Border, its traditions, customs, and dialect, have enabled Mr. Charles Gibbon to produce in *Love and War* a novel which may bear reading even after Scott. Taking for his theme the Court of the Third James of Scotland, at Linlithgow, and the ascendancy of Cochrane and his associated favourites in that monarch's counsels, to the prejudice and disgust of the Douglas, Lord Gray, and the great territorial nobles, he has interwoven a romantic love-story, opening with interrupted nuptials in a Border castle, where Katherine Janfarie, the daughter of a bold

Borderer, forced to the altar for union with Sir Robert Cochrane, and for the honour of alliance with the upstart favourite, is carried away by a Lochinvar-like suitor, Bertrand Gordon, of Lamington, a loyal and gallant Borderer, who thus draws upon himself the persistent hostility of the wild-spirited Janfarie clan, as well as the secret malice and plotting of the cheated bridegroom. An instant and hot pursuit of the fugitives, with picked men and bloodhounds, under the symbol of the "Hot Trod," and the lead of Sir Hugh Janfarie, his son, and son-in-law that should have been, brings them to bay in the town of Dumfries, and serious complications arise in the slaughter of Sir Hugh amid a fray with the townsfolk, fomented in the first instance, for the object of securing the escape of himself and his lady-love, by Gordon's artful suggestion that they should let Cochrane "ken what they thought of his 'base plack'"—i.e. "debased coinage." Add to this at a later period—when the course of true love was already going anything but smoothly through the artifices and plots of the wily Cochrane, and the true knight Gordon was for his lady's sake avoiding the single combat which the eldest son of Sir Hugh was eager to fasten upon him—a compulsory duel involves the hero of the romance in seemingly additional blood-shedding, and renders it, in the light wherein the matter is reported to Katherine, a matter of conscience to stand aloof from a lover imbrued with kindred blood, even while she cannot bring herself to accept the addresses of his rival. The course of the story introduces us to palaces, priories, ramparts, camps and tented fields; and the heroine departs herself consistently as a meet child of a bold Borderer, such as might well prefer a gallant soldier and noble to an upstart favourite, who in the end gains his deserts, a gallows on Lauder Bridge. Among the characters of the romance, those of Margaret of Denmark, the brave wife of the timid, impulsive James III.; the Abbot Panther, a priest politician of the type of those whose coat-of-mail was apt to rattle under their cassocks; and in a lower stratum of society, Wild Will Craig, Gordon's faithful retainer, and his hound, Stark, deserve most credit for thoughtful and studied delineation, and it is easy to see that like pains have been bestowed upon the high-vaulting aspirant, Cochrane, for whose complicity with the murder of the Earl of Mar access has been had to history.

Under the Will and other Tales strikes the habitual novel-reader with the same sense of outwitting as the discovery some years back that a popular authoress's title, *Nothing New*, of a forthcoming three-volumes strictly described a collection of lighter and shorter tales from magazines. Miss Hay has, doubtless, won favour by her *Old Myddelton's Money*, but it is a dangerous strain to adventure on the device adopted to float *Under the Will*, more especially as the name-giving story strikes us as one that we have met with before in recent magazine literature, and one that on the score of its sketchy want of finish it is not easy to forget. The plot consists of the emigration of two fellow-pupils, Charles Mastyn and Alan Fielding, to Venezuelan

Guayana with land-warrants issued by a Mrs. Matherson's company, in the hope of winning fortunes in an Eldorado which shall enable them to return to the home of their earliest recollections, the personage of their tutor, Mr. Wynne, to whose daughter, Hope Wynne, the first and most sanguine of the emigrants is engaged. The scheme turns out one of the most outrageous and criminal bubbles. The defrauded emigrants, stricken with fever and ague, die daily in the swamps and bush, where provisions fail them, and hope by degrees deserts the most sanguine-hearted. Only when Charles and Alan have hired a canoe to quit the settlement, which is a "lucus a non lucendo," does the former chance upon a stray scrap of a newspaper advertising for him as "heir to an old uncle, a former Glasgow merchant." Anon a stranger calls at an English lawyer's office, exhibits documents which prove Charlie Wynne's title to the legacy "under the will," tells the tale of the suffering and famished colony, and, having got possession of the inheritance, hurries back to Venezuela to rescue his fellow-settlers, and erect a monument to his especial comrade. It turns out in the sequel that it is Alan who has obtained the legacy in the deceased Charlie's name, a fact which reflects small credit on Messrs. Cotes and Fane, solicitors, of Lincoln's Inn; and as for the betrothed Hope Wynne, the swamp and the fever seem to have been deemed by the authoress a sufficient excuse if from the time of the departure of the emigrants "Oh no! we never mention her." A short tale "My Only Novel," in the second volume seems to show by its slender, shifting construction that Miss Hay's forte is not concatenation of incidents. The reader oscillates between "Fat Boys" and "Only Novels" with a puzzlement arising from reluctance to believe that a smart and not unobservant writer means no connexion between them. A brief tale of a belfry, entitled "Locked In," in the third volume exhibits some elements of the comic vein, which is the better feature in "My Only Novel." But—to select from so large a choice of tales—we must be content to pronounce that the true bent of Miss Hay's genius, as developed in this *olla podrida*, is in the direction of stories of old houses and castles having a tragic event connected with them—such, for instance, as "Told in the Picture Gallery," or "Sir Rupert's Room."

The third novel on our list is a not uninteresting tale by an obviously young hand. It can hardly be called a novelette, being barren of all love-passages, and perhaps its ambition would be to pass for a "story with a purpose." Godfrey Mainwaring, the hero, runs away from Dr. Dibdin's school at the age of seventeen, and avails himself of a steerage-passage to Melbourne immediately after learning that his father and mother have died of fever in Australia, leaving him and an elder sister penniless. As his father's English banker, Mr. Price, had offered to defray Godfrey's school expenses, and to take him into his office on his leaving school, it was certainly "a false step" to take French leave to "cross the herring;" and throughout three hundred pages we are kept

in mind of this by a series of mishaps occurring to him, out of which he emerges with wonderful success, considering that they are regarded as Providential corrections. From the wreck of the burning ship he escapes, and saves his captain; and when the little band who were cast on a desert island were like to perish of starvation, Godfrey, after being rescued by the Newfoundland dog, "Rollo," from being engulfed in a quicksand, saves his companions by discovering a cavern stored with provisions by the forethought of a young Price, the son of his father's London banker, who had made just such another "false step" before him. After reaching Melbourne, and finding that his sister has left, our hero is out of luck for some little time, until he falls ill under the friendly roof of Charles Fryer, a wood-splitter, near whose station in the next September the flooding of the River Goulburn, opportunely for Godfrey, affords him the means of saving a certain settler, Mr. Hamilton, of Wauregarwan's, life, just when he was in imminent peril of losing his own. For this service he is installed as tutor to Mr. Hamilton's two boys, and this gives him a grand field for airing his knowledge of natural history at such times as he is not otherwise engaged—e.g., at getting out of the bush into which he has been lured by a bushranger; or rescuing his two pupils from perils into which the dreaminess of the one and the inconsiderateness of the other led two not ill-disposed lads. Of course all ends "first-rate;" the hero going to complete his own and his pupils' education at the "modern" and Northern Athens, at the same time that his friend the wood-splitter returns to England to take possession of a fine estate, the heir of which had been advertised for. Our only objections to *A False Step* are that the hero is a kind of colonial cross between Lewis Arundel and Charles O'Malley; and that upon being installed as a tutor in an Australian station, the author thinks to make up for his youth by his preternatural didacticism. JAMES DAVIES.

CURRENT LITERATURE.

WE must reserve a longer notice of Mr. John E. B. Mayor's edition of *The English Works of John Fisher, Bishop of Rochester*, till the second and, as we may judge, concluding volume shall have appeared. In the advertisement on the cover of the volume we observe that this first instalment is called "Part I. The Text," as if the next volume were to consist of prolegomena and notes. But there are other English works of Fisher's which do not appear here. And the Latin works of the saintly Bishop of Rochester are at least as valuable as those in the vernacular. We trust the Early English Text Society may see their way to admitting these also into their Extra Series. The editor in his Preface confines himself to drawing attention to some notable passages in the different treatises here produced, and it seems to us it would have been wise in doing so to adopt modern spelling, which would have been more attractive to the only class of people who would require such an analysis of the contents of the volume. Indeed, we should be glad to see the whole works reprinted without the servile copying of type and spelling which is uniformly adopted in this series. Fisher's works are of great intrinsic value, and would interest many readers who will be deterred from reading them by the form in which they appear. On the other hand, if it is desirable to

carry the copying of type to the extent which appears in these volumes, we should have been glad to see it consistently carried out by printing the colophons and devices of Wynkyn de Worde as they exist in the originals. For the bibliography of the works contained in this volume we have to wait for the General Preface, which we hope may appear somewhat earlier than Mr. Mayor's anticipations would lead us to expect.

The Similes of Homer's Iliad, translated, with Introduction and Notes. By W. O. Green, M.A. (Longmans.) The idea of putting in one's thumb and pulling out these plums from the *Iliad* impresses us at first unfavourably, as though it involved a wrong mode of dealing with the poem. But in reality the similes—commonly introduced with the form "As . . . so"—detach themselves easily from the surrounding matter, and when placed together they form a collection, as it were, of little cameos or intaglios of poetry. Mr. Green has made an interesting and beautiful volume. His renderings (which are in blank verse), if they do not delight us with the sudden luminousness of words new-created by genius to interpret the words of a brother-poet, are yet evenly excellent, pure and strong in choice of language and in the treatment of the verse. Mr. Green submits to the severe test of printing the Greek on one page and the English on the page opposite. He is particularly observant of the effect produced by the pauses in the original. The Introduction contains a little study of the Homeric simile, including a brief comparison of it with the simile of Biblical poetry, with that of Dante, and that of Spenser. "There are in the similes three points of resemblance between Dante and Homer. First, digressiveness, if I may so call it; a love of painting out the picture with details unnecessary to the comparison. Second, vividness and clearness. Third, homeliness; a selection of the commonest objects for illustration, if only they be suitable and forcible. In all these three points Dante is like Homer; and in the last point (if we except the Hebrew poets) Dante alone is like Homer." Mr. Green, after touching on the value of a study of the Homeric similes as a test of unity of authorship, concludes with the following words:—"But on this well-worn question I shall forbear to enter: and will only conclude by saying that an attentive consideration of the similes has left me more than ever what I was before—a believer in one great poet Homer." One specimen will fairly represent the general character and quality of Mr. Green's work:—

"Such watch the Trojans kept. Th' Achaean host
Dread panic, comrade she of shuddering flight,
Fast bound; and all the bravest and the best
Were stricken sore with grief intolerable.
And vexed and tossed as is the fishfall main
When north and west wind meet, two Thrace-born
blasts,
With sudden squall—The black waves tumbling
crowd
High heaped: the beach with tangle thick is
strewn—
So tossed, so vexed, their souls within them
swayed.
And stricken to the heart with mighty woe
The son of Atreus ranged the camp, and bade
The clear-voiced heralds to the council call
Each man with several summons, not with shout;
And in the task himself bore foremost part.
They came and sat in council sorrowing:
But Agamemnon rose and stood, whose tears
Fell as the dropping of a deep black spring
That down the steep cliff pours its waters dark,
So he, sore groaning, 'mid the Argives spake."

MESSRS. ROBERTS BROTHERS, of Boston, have published *Syrian Sunshine*, by T. G. Appleton, an account of six weeks' travel in the Holy Land. The author appears to have brought no previous acquaintance with his subject and no learning to bear on it. The record of his journey is therefore very uninteresting. The chief feature in the book as a number of florid and high-flown digressions upon Spiritualism, in which the author undertakes

to prove the truth of Christian miracles, &c., by the hypothesis of Spiritualism.

L'Abdicazione di Diocleziano. Studio storico di Achille Coen. (Livorno.) When Diocletian descended from the throne to plant his cabbages in the retirement of Salona, the impressive act not only stirred the imagination of his age, but also bequeathed to history a problem which she has often tried to solve. Was it the mere weariness of absolute power which made him long to lay the burden down, and go in peace; or did the sense of failing vigour warn him to pass on his work to other hands while there was still time? Such at least were the motives readily assumed in ancient times, as they were also variously urged in other ages to explain the like acts of Sulla and of Charles V. Did the ambition of Galerius, his younger colleague, take advantage of a moment of depression and disease to force his wavering will, and drive him to resign? So runs the story in the tract "*De Mortibus Persecutorum*," whose ill-attested statements find little favour in the eyes of cautious critics. Had he pitted himself in an ineffectual struggle with the Christian Church, which stained his memory with blood, till he was at last fain to confess his failure by retirement, and to leave the future to his rivals? There is no solid evidence, indeed, for such a fancy; but prejudiced ecclesiastics have been often somewhat heedless in this subject of the rules of sober logic, and in this respect De Broglie and J. Ampère in our own days have reproduced with less excuse the passions and the triumph of the Church of the fourth century. Was it, as Burckhardt and others have urged, an essential part of the new scheme of imperial rule that the reins of power should be held only by strong hands, and that after twenty years of work each Augustus in his turn should find a Caesar to replace him? The hypothesis is bold enough, and there is no trace of such a theory in the pages of any ancient writer. To these more or less inadequate solutions the author of a recent essay has another of his own to add, which is at least ingenious, and seems to agree with the main data of the problem. He first explains the fourfold division of power between the two Caesars and the two who bore the higher title of Augustus, not only by the military needs of an unwieldy empire, but by the wish to define the order of succession and prevent the recurrence of past evils. For three centuries the occupants of the imperial throne had been elected, but the title to elect had variously rested with the ruler, the Senate, the populace of Rome, the Praetorian guards, and the legions of the frontier. Plots, assassinations, civil wars, and military licence had been the fatal outcome of this ambiguous title. They might haply be avoided if each Augustus named his younger Caesar to share his cares awhile, and then step into the place which he vacated; and a precedent for this might have been found in the age of the Antonines of happy memory. It remained to see how such a theory would work in practice, and its author, Diocletian, could only witness the issue of the new experiment by first relinquishing his throne, and forcing his old comrade to do likewise. If this was so, the new system soon failed hopelessly; the death of Constantine Chlorus broke up the concert, for his son, the ambitious Constantine, appealed to the old principle of popular election, and made good his title with the sword. Such in brief is the hypothesis suggested by the Italian writer, and supported both by clear reasoning and learned illustration.

Perak and the Malays. By Major F. McNair, late R.A. (Tinsley Brothers.) This is in many respects a painstaking book, and contains a good deal of information, the result of the author's long acquaintance with the land and people. His description of the general configuration of the country and of its natural features is clear and good. Like other residents, he thinks the Malay character has been maligned by the popular

verdict, and he attributes most of their faults to long misgovernment. He speaks of the introduction of Mohammedanism by the Arabs, with polygamy and its consequences, as an unmitigated evil. Here we can hardly follow him; the Arabs were not quite the mere Bedouin which he considers them, and the morality and social order they introduced were probably a considerable advance on the pre-existing state of things. In some respects the book is disappointing, and, indeed, rather heavy. The notices of the flora and fauna, for instance, and of the minerals, contain little, if anything, that is new to the ordinary reader. Various customs which he describes are only those common to other Eastern people, and of his advice to settlers we might remark that the use of flannel, of chlorodyne, and of Worcestershire Sauce conduces to our comfort in many parts of the world besides Perak. Again, the origin and relations of the race, and of their language, are wide questions, which to be worthily handled should be treated with more thoroughness and detail. The author relates the events which in 1874 made the name of Perak familiar to English readers—viz. the disturbances which led to the murder of the Resident, Mr. Birch, and the subsequent military operations. With personal knowledge of the subject, Major McNair still thinks that the system of maintaining a Resident at the native Courts to advise and interfere—in short, to exert "moral influence"—is a good one. We should have drawn a different moral from those events; but the system can only, at best, be one of transition. All our possessions on the Malay coast were acquired, we believe, by purchase; and it is said that the remaining chiefs would willingly accept mediation, which, in view of the responsibilities we have already assumed, would perhaps be the simplest solution of the problem.

NOTES AND NEWS.

We learn that the Dean of St. Paul's has in the press a volume of Sermons preached before the University of Oxford in 1876-8, to which will be added three Ordination Sermons. Messrs. Macmillan and Co. are the publishers.

IN consequence of the illness of Prof. Volpé, who had been appointed to deliver the Barlow Lectures on Dante, the Council of University College, London, have appointed Mr. Charles Tomlinson, F.R.S., to deliver them this spring. The course will consist of twelve lectures to be given in the College on Tuesdays and Thursdays, at 3 P.M., commencing on Thursday, April 25, and will be open to the public of both sexes without payment.

MR. W. M. ROSSETTI writes to us:—"Will you allow me to correct, through your pages, a stupid blunder which appears, I regret to say, in all the three editions of Shelley with which I have had to do, and, I believe, in all editions whatsoever? It was pointed out to me the other day by an illustrious poet. In the brief poem, *Similes for Two Political Characters* of 1819, the second stanza begins with these words, as printed:—

'As two gibbering night-birds fit
From their bowers of deadly *hue*
Through the night to frighten it.'

The word *hue* ought to be *yew*; and as soon as this is pointed out, it almost seems as if anybody except an editor of the poems could see as much for himself. The poem was first printed, about fifty years ago, by Medwin in the *Athenaeum*, and there the word is correct (*yew*); but in every subsequent reprint, including Medwin's own, *hue* has been palmed off upon the reader."

WE regret to find that the Working Men's College, in Great Ormond Street, is not yet, after nearly twenty-five years' trial, able to pay its way. The income of 1877 failed to clear off the balance of 78*l.* 15*s.* against it at the beginning of the year, notwithstanding the receipt of donations

and subscriptions amounting to 115*l.* 4*s.* 6*d.* The capital account is more cheering, as there is only a debt of 67*l.* on property that must be worth 4,000*l.* or more. The college needs a large accession of students to set it in good working condition, and a gift of a thousand pounds to free it from debt and enable it to make some needed improvements in its rooms.

MR. ALEXANDER SMITH, of Glasgow, the Honorary Secretary of the Hunterian Club, has reprinted in a handsome quarto for private circulation the amusing play of *Nobody and Somebody*, which the late Mr. Richard Simpson included in his *School of Shakspeare*. The cuts of Nobody, all legs (and head) and no body, and of Somebody, with his big body and "no legs to speak of," are very good. Mr. Smith, too, has been able to date the play, by means of Mr. Arber's invaluable *Transcript of the Stationers' Registers*, which, at vol. iii., p. 316, gives the entry:—

"12^o Martij 1606.

"John Trundell. Entred for his Copie vnder the handes of Master WILSON and the Wardens A Booke called *No bodie and some bodie*, &c. . v*j*^d." On January 8, 1606, had been entered "The picture of No bodye."

MESSRS. GRIFFITH and FARRAN will publish shortly *Bonnie Lesley*, a story for girls, by Mrs. Herbert Martin; a translation by Miss Harriet Poole of Mlle. Laroque's *Grande et Petite*, with illustrations by Bertall; and new editions of *Little Lisette* and *Clement's Trial and Victory*, by M. E. B.

CAPTAIN GAMBIER, author of "The Life of Midhat Pasha" in a recent number of the *Nineteenth Century*, is about to publish through Messrs. C. Kegan Paul and Co. a small book on Servian History. His aim is to call attention to the possible fate of a small and struggling nation which he holds to be destined to play a great part in the solution of the Eastern Question, and whose interests it is impossible to sever from those of the British Empire.

THE author of *Johannes Olaf*, which met with so much success in Germany, has just written a new novel called *Still Life in Troublous Times*. The story is laid during the Napoleonic occupation of Germany, and presents a charming mixture of fact and fiction.

THE Philosophic Faculty of the University of Zürich has just conferred the degree of Doctor Philos. Honoris Causa on Mr. T. T. Wild, formerly of the scientific staff of H.M.S. *Challenger*, and author of the recent work *Thalassa*, embodying some of the results of that expedition.

A NEW weekly paper has appeared in Florence called *La Rassegna Settimanale*. It is of the same scope and character as the *Saturday Review* in England, and though largely political, it admits occasional essays and reviews of books. It is a new experiment in Italian journalism, and was set on foot by some of the younger professors of the University of Florence.

THE long-expected preliminary volume of Meyer's *Geschichte des Schweizerischen Bundesrechtes* is announced for publication early in March.

THE Library Association of the United Kingdom—the permanent outcome of the late Conference of Librarians—has commenced its monthly meetings, which will be held for the present at the London Institution, on the evening of the first Friday in each month. All persons interested in library-management are eligible for election. The first annual meeting will be held at Oxford, in the autumn.

LIBRARIANS and owners of libraries will be glad to hear that a dépôt for "library-supplies" has been opened by Mr. Trübner, whom the American Library Association have appointed their agent. His first consignment includes a number of the revolving bookcases of which the only one then in Europe was so much admired at the Conference.

THE writings of the late Fritz Reuter earned for the "Plattdéutsch" dialect so high a place in modern literature that it is probable many will be glad to know that "Willem Schröder" has published a cheap little biography of the great German Chancellor in that particular "Mundart." *De Plattdútsche Bismarck* is intended to be a people's book, has capital illustrations ("30 fine Billers uutstaeft van Hermann Lüders"), and only costs two marks. In the form of a talk among the members of a Bauern-Club in the village of Gröpel in Lüneburg, it gives a sketch of the history of the Prince's ancestors, and a lively and humorous narrative of his own eventful life, or, as it is put in the work itself, the tale "van Bismarck, mit Allen, wat dran bummelt un hammelt." It is published by Otto Spamer, of Leipzig. The language will offer few difficulties, and will perhaps afford some philological instruction to those who have stumbled their way through the strange varieties of the locally distant but philologically near "Schweizerdeutsch" in the novels of Bitzius or the tales in the Swiss Kalendars.

M. DE LA REVILLA makes two contributions to the *Revista Contemporanea* of January 15: one contains part of the Introduction to his translation of the philosophical works of Descartes; the other, a criticism of Juan Valera, the author of *Pepita Jimenez*, to whom he allows learning and talent and grace, but neither sensibility nor genius. Estassen gives the first article of a "Study of the Evolution of Religious Institutions," following the school of Darwin. Rouget calls attention to Borrell's *Tratado teórico y practico de dibujo* as an excellent guide to archaeology in Spain, and a far better book and of wider range than its title would indicate. Arenas has a noble sonnet on the struggle of Hercules and Antaeus as a type of the secular contest of Good and Evil in the universe; and P. Gener a bitter polemical review of the opening discourse of the President of the Athenaeum of Barcelona.

A NUMBER of eminent citizens of Geneva, representing eighty different Societies of the City and Canton, have just held a preliminary meeting to make arrangements for the Rousseau-centenary, which is to be celebrated on the anniversary of his death, July 2. A committee of twenty-five members was nominated, who have the power of adding others to their number, and to whom the entire management of the festival is entrusted. It is proposed to extend the celebration over three days, from June 30 to July 2, giving the first day an exclusively scientific and literary character, and making a "People's Festival" of the second day, and a "Juvenile Festival" of the third. Orders have been given for the design and engraving of a commemoration medal.

A REVIEW of Catholic periodical literature has for the last two years been published by Woerl of Würzburg. This year the work embraces a wider field, including not Europe only, but all the quarters of the globe. The reviewer accompanies his work with critical observations, and, as in every case where it is possible the number of each periodical's circulation is given, a tolerably comprehensive glance may be obtained from it into one side of the Church's activity. In Germany, as might be expected, the Ultramontane press flourishes most in Bavaria, where it possesses not less than seventy-six organs, and *abonnements* to the number of nearly four millions. It is observable that the number of periodicals rises everywhere in proportion to the force with which a *Kulturkampf* is waged in the country. For example, the one million of Catholic Swiss have fifty journals with considerable circulations, while Austro-Hungary, with thirty times as many Catholics, has only ninety. Belgium, with its 117 journals and reviews, carries off the palm from all other countries, while in Catholic Spain the Catholic press is starved, and even in France it makes comparatively but a poor show. Of the 1,400,000 copies of papers daily issued

in Paris, only 56,000 are, according to the Catholic reviewer, "good," while 344,000 are "moderate," and a whole million are "horrible." In Italy their case appears still worse, for want of capital. Scarcely one-fourth of the few Catholic daily papers, we are told, can support themselves by their own resources without the support of some rich patrons. The greater number have a circulation only of from four to five hundred. As to the strength of their editorial staff the reviewer remarks that "in many offices there is no one who understands the French language, from whence it arises that the strangest misconceptions as to the conditions of foreign countries are prevalent among the readers of Catholic papers, because the editors themselves are wholly in the dark on these matters."

THE New York *Nation* announces the union of the two firms of H. O. Houghton and Co. and J. R. Osgood and Co., under the name of Houghton, Osgood and Co.

ERRATUM.—P. 165, col. c, line 22—for "Viola," read "Olivia."

FOREIGN REVIEWS OF ENGLISH BOOKS.

LANE'S Arabic-English Lexicon. Book I. Part 6. Ed. Stanley Lane Poole. *Revue Critique*, January 28. By H. Derenbourg.

THOMSEN, V. Relations between Ancient Russia and Scandinavia. *Revue Critique*, February 23. By L. Léger.

OBITUARY.

THE Rev. John Wood Warter, B.D., the learned and accomplished vicar of West Tarring, died on the 21st ult. He was born in 1806, and graduated B.A. of Christ Church, Oxford, in 1827. In 1834 he was instituted to the vicarage of West Tarring, having previously served from 1829 to 1833 as chaplain to the British Embassy at Copenhagen. The picturesque village of Tarring is famous for the remains of the ancient palace of the Archbishops of Canterbury, the fig-trees which Bishop Richard of Chichester grafted with his own hand, and for the birthplace of John Selden, the great English legist. Mr. Warter's affection for the parish prompted him to publish in 1860 two gossiping volumes, full of antiquarian interest (entitled *The Seaboard and the Down*), on its varied attractions in rural beauty and historic association. A few years later he issued a companion volume of *Parochial Fragments*, containing more detailed particulars of the careers of Archbishop Becket and Selden. Having married the eldest daughter of the poet Southey, he devoted the leisure hours of many years of his life to editing the literary remains of his father-in-law. The sixth and seventh volumes of *The Doctor*, and in 1848 the whole work in one volume, were issued under his care. He was also responsible for the publication of the contents of Southey's *Commonplace Book* (1849–50) in four huge volumes, and *Selections from Southey's Letters* (1856, four vols.), the last being a continuation of Outhbert Southey's volumes of his father's correspondence. The late Mr. Warter's religious and political opinions might have been modelled on those of his distinguished father-in-law. In 1844 he published two volumes of *Plain Practical Sermons*, and at various times he printed single sermons which he had preached at the consecration of new churches. His attachment to the principles of the Church of England, as opposed to what he considered the distinctive doctrines of the Roman Church, drew from him a *Pastoral Letter on the New Roman Catholic Aggression* (1845), and a *Plain Protestant's Manual* (1851).

THE Rev. Robert George Baker, Vicar of Fulham from 1834 to 1871, died at Ivy Cottage, Fulham, on the 21st ult., in his ninetieth year. He graduated at Trinity College, Cambridge, in 1810. Bishop Blomfield showed his appreciation of Mr. Baker's conduct in managing the episcopal parish of Fulham by appointing him to the Prebend of Reculverland in St. Paul's Cathedral in 1846. He published several sermons, the most important

being on the Christian duty of helping the poor to help themselves. His pamphlets entitled *Account of the Benefactions and Charities of Fulham* and *The Olden Characters of Fulham* (1847) contain some information not to be found in Faulkner's History of that parish.

NOTES OF TRAVEL.

In the latest part of the *Proceedings* of the Berlin Geographical Society (No. 10, vol. iv.) Herr J. M. Hildebrandt gives an account of his attempt to reach the snow-clad Mount Kenia in Eastern Equatorial Africa, to which we have before referred. Speaking of the causes of failure he says:—

"In Kitui (a village in Ukambani) I had to contend against the greatest prejudices, for in Krapf's unfortunate journey to the Tana, which he made in 1851 in company with the chief Kivoi, the latter was killed by the Kitu robbers. The blame of this was laid to the account of the missionary, who was said to have worked a wicked spell with his black implement—his pocket Bible. As a brother European this guilt was transferred to me. . . . Only three days' march from my station rose the great snow-capped Kenia. From one point, indeed, I was able to determine the important angle from Kenia to Kilimnjaru. But these three last marches were impossible, for the Wakwafi, shortly before my arrival, had slaughtered a caravan of 1,500 armed Arabs to the very last man. . . . With my small escort, it was, therefore, out of the question to try to force a passage, and I consequently tried to enter into friendly negotiations, sending forward presents of beads, &c. . . . On the third day my messengers returned, still panting with fear and hurry. They had seen the Wakwafi, and fled, throwing away both their presents and provisions in their haste to escape."

Petermann's *Mittheilungen* for March brings a very remarkable map representing Europe in the two glacial periods, compiled by Herr Habenicht. This with its accompanying paper is a continuation of a former essay on the distribution of the sedimentary formations in Europe, and the series will be completed by a study of the eruptive and metamorphic rocks of the continent, the three being intended to give, for the first time, a clear, general idea of the geological structure of Europe.

An excellent paper in the same number, by Dr. J. van Bebbler, will be interesting to meteorologists as giving a comparative view of the simultaneous weather-observations which are being made by each of the maritime nations of Europe at the present time, with a special account of the system adopted at the Hamburg Observatory and its outposts, which now extend from the west coast of Ireland to the Black Sea, and from Northern Scandinavia to the southmost point of Italy. Dr. Oscar Drude's essay on the geographical distribution of palms is completed in this part; and we have also a sketch of the history of exploration on the West-African river Ogowe, with a map of De Brazza's surveys there during 1876-77.

News reached St. Petersburg a short time ago by way of Semipalatinsk that the Asiatic traveller, Colonel Prejevalsky, had been laid up by illness for two months at Guchen, and was obliged on this account to return to Zaisan for medical aid. The illness is not a dangerous one, and on his recovery he intends to proceed with his expedition to Tibet.

The reports, first of the death of Marquis Antinori, the leader of the Italian African Expedition, and afterwards of his return to the coast at Zeyla on his way to Europe appear to have been both untrue. Letters bearing date November 28, 1877, written by him from Mahal-Monza in Shoa, have recently been received by the Italian Geographical Society. His second in command, Captain Martini, is on his way home, and by last accounts had reached Aden. The Gessi-Matteucci expedi-

tion, on its way from the Nile valley to Shoa, was to leave Khartum on January 1, going by the Blue Nile, Fazokl, and the Tumut to the Sobat river, and thence upward through the unknown country.

MR. W. H. DALL, of the United States Coast Survey, is writing a full account of the Aleutian Islands for the *Journal* of the Bremen Geographical Society. The first part of it, now published, gives a sketch of the former Russian and American explorations in this region, up to that of the United States Coast Survey officers in 1871-74. The geological formation, flora and fauna of the islands are also discussed.

In his Monthly Report for March, Dr. Behm notes that a hitherto-unknown region of the west coastland of South Africa, lying north-west of Herero Land and south of the Cunene river, was traversed in June and July last year by two members of the Rhenish mission, J. Böhm and F. Bernsmann; and that the manuscript map which they have now sent home contains a great amount of new geography. This north-western country is named Kaoko, and appears to be very thinly peopled, though it is not unfertile.

By the French Budget it is proposed to devote 170,000 francs to the service of the "Missions Scientifiques" during the present year. This sum will be distributed as follows:—30,000 fr. to MM. André and Angot in California; 40,000 fr. to M. Roudaire in aid of his work in Algeria; and 100,000 fr. to the Abbé Debaize to defray the expenses of his explorations in Central Africa.

It is stated that during the spring a Russian expedition will endeavour to make ethnological investigations among the Vogels and Ostyacs of the Obi and Irtysh rivers.

M. SOLEILLET, whose work entitled *L'Afrique Occidentale* was alluded to in the *ACADEMY* a short time back, is preparing to start for the Senegal, in order to undertake a journey of exploration to Timbuktu and on the Niger. M. Soleillet, we believe, even entertains hopes of being able to reach Algeria.

A WORK which is of considerable geographical interest at the present moment is now being printed at Madrid in the shape of the recently-discovered account of the travels of an unknown Spanish missionary in the fourteenth century. The author is said to have made several long journeys in Africa between 1320 and 1330. He appears to have travelled much on the west coast, going as far south as Dahomey, and to have made a journey from the mouth of the Senegal for a considerable distance into the interior. During the period named he also traversed Dongola, and found his way down the Nile to the Mediterranean.

A DUTCH company has recently obtained from the Khedive the right of draining Lake Mareotis, by which means it is hoped that some 75,000 acres of land may again be brought under cultivation. Should the experiment be successful, it is proposed to plant the land thus regained with vines, for which the district was formerly famous.

THE newly published *Bulletin* of the Société de Géographie of Paris, which is an unusually interesting number, contains among other matter M. J. B. Paquier's second paper on the Pamir plateau and Kashgaria; "Itinéraire de Chung-king à Yunnan-foo," by M. Rocher; an account by Colonel Chanoine of "Les Travaux Géodésiques" of the Russian Geographical Society in Asia; a letter from M. Ch. de Ujfalvy, giving geographical, archaeological and statistical information respecting the province of Kuldja; as well as the address delivered by Captain Ernest Mouchez, Vice-President of the Society, in the place of Admiral de la Roncière le Noury, at the general meeting in December last.

AN Anthropological Society has just been founded at Havana in connexion with that of Madrid.

WE hear that it is proposed to found a chair of Demography at Moscow.

THE SWISS ALPINE CLUB.

IN September of this year the Swiss Alpine Club will hold its annual assembly at Interlaken. The Section Oberland intends to mark the gathering in its own special district by opening an Alpine Exhibition. Some years ago the editor of the *Alpenpost* attempted to found an "Alpinum" with a permanent exhibition at Zürich, but without success. Last year an Alpine Exhibition was held at Gmunden in Upper Austria; it appears to have met with general approval, and many articles were sent to it by Swiss Alpinists. Interlaken is perhaps the fittest spot in the whole world for such an undertaking, and the arrangement has apparently been placed in capable hands. The Section Oberland state in their programme that only articles of proved usefulness and of the best quality can be received. All articles offered for exhibition will be subjected to the scrutiny of a jury of experts. The programme suggests the following as fit objects for the exhibition:—1. Tourist-clothing—head-coverings, boots, plaids, stockings, gloves, &c. 2. General Alpine panoply—hand-bags, riding-saddles, field-seats, straps, and other leather articles: alpenstocks, ice-axes, hammers, and metal articles: hammocks, ladders, and various rope articles: lanterns, drinking-vessels, flasks, lights, cases of instruments, drawing and painting materials. 3. Eatables and drinkables—biscuits, condensed soups, chocolate, &c. 4. Cooking and heating apparatus for club-huts, pocket cooking-apparatus. 5. Field-medicine and surgery—homoeopathic and allopathic preparations, compresses, charpie, material for staunching blood, &c. 6. Models and plans for club-huts—their environment, building, and furnishing. 7. Art and art-industry—drawings and photographs of the higher mountains, panoramas, reliefs, maps (geographical, topographical, geological, and hydrographical); instruments and apparatus for scientific researches—optical, physical, time-measurers, and way-measurers. 8. Collections from the departments of geology, mineralogy, zoology, and botany. 9. Alpine literature, travel-handbooks, science, entertaining reading. If the actual exhibition should correspond to the plan laid down, it will leave nothing to desire in its range and many-sidedness, and will prove an additional attraction to Interlaken, although the time during which it is proposed to keep it open seems ridiculously short—only a fortnight. A conference of delegates from all the sections of the Swiss Alpine Club will shortly take place at Bern, and we hear that some intend to propose that the exhibition shall remain on view during the whole tourist-season.

SELECTED BOOKS.

General Literature.

- DU CAMP, Maxime. *Convulsions de Paris*. T. 1. Paris: Hachette. 7 fr. 50 c.
 GIDEL, C. *Nouvelles études sur la littérature grecque moderne*. Paris: Maisonneuve.

CORRESPONDENCE.

MACBETH A GOOD CHURCHMAN.

1 Oppidans Road, N.W.: February 23, 1878.

It may be a satisfaction to some minds to be assured that, after all, Macbeth was a good Churchman. Shakspeare has overlooked this side of his character, though Holinshed has recorded it, and the fact is verily so, as was long since remarked by Mr. J. H. Burton. What I wish now to point out is the mention of Macbeth in this aspect in a famous Elizabethan work—even in *Laws of the Ecclesiastical Polity*. "Will any man deny that the Church doth need the rod of corporal punishment to keep her children in obedience withal? Such a law as Macabeus made among the Scots that he which continued an Excommunicate two years together and reconciled not himself to the Church, should forfeit all his goods and possessions." Keble's note quotes from Boece the Latin of this as Hooker thinks commendable enactment:—"Qui pontificis auctoritatem annum totum execratus contempserit neque se interim reconciliarit, hostis reipublicae habetur; qui vero duos annos in ea contumacia perseverarit fortunis omnibus multatur." JOHN W. HALES.

TRANSLATION OF LESSING'S "LAOCOON."

London: February 25, 1878.

A note in Mr. Sime's recent valuable work on Lessing (vol. i, p. 308), enumerating English translations of the *Laocoon*, speaks of one in 1853 by E. Beesley. This is a slight inaccuracy. The translation of 1853, which is careful, scholarly, and idiomatic, is by E[dward] C[alvert] Beesley. There is prefixed a short Introduction by Dr. Burbidge, then Master of Leamington College. The book was printed and published at Rugby, by Messrs. Crossley and Billington. Messrs. Longmans were the London publishers.

SHADWORTH H. HODGSON.

"MARMORNE."

Bolsvipers: February 24, 1878.

When a novel depends for its interest chiefly on the development of its plot, it is generally understood to be a breach of literary *convenances* on the part of a critic to tell the story in his own bare, brief way. Mr. Saintsbury has done this for (or against) *Marmorne* in the last number of the ACADEMY, and thereby has placed himself in striking contrast to most critics of the book, who have refrained with much delicacy from spoiling whatever interest the reader may find in it. Besides this, Mr. Saintsbury says "the author gives us to understand that his story is in the main true;" which is very inaccurate. The story of *Marmorne* is pure fiction with the exception of one single incident, the imprisonment; and even that, as I said in the Preface, took place under totally different circumstances. Mr.

Saintsbury says that "true stories are generally a snare to all but consummate workmen," implying that *Marmorne* is a true story, which it is not. Again, he says that "the author does not seem very much at home in French law." *Marmorne* has been read by Frenchmen: there are five or six pages about the book in the *Revue des Deux-Mondes* (February 15), and not a single Frenchman has raised the slightest objection to it on the ground of law. Mr. Saintsbury probably shares the usual English delusion that a French estate must necessarily be sold on the death of its owner, and the proceeds divided equally among his children. The law in *Marmorne* is accurate enough for the purposes of art, and the author of the book has too many French lawyers among his acquaintance to suffer the slightest embarrassment on any legal question. Lastly, it pleases your critic to say that the author is deficient in grasp of character, and he repeats the word very emphatically: "Character! character! character!" not seeming to be aware that there are two distinct classes of novels—character-studies and narratives. *Marmorne* is a simple narrative in which the painting of character, though not neglected, is nevertheless purposely subordinated to the story.

ADOLPHUS SEGRAVE.

GRIMM'S LAW.

II.

London: February, 1878.

In my former letter I maintained that the facts upon which "High German" is admitted into "Grimm's Law" on a level with Sanscrit and General Teutonic are not sufficient, are comparatively modern, and are capable of other explanation.

1. They are not sufficient. According to the Law a General Teutonic (which I prefer as stating a fact that "Low German" disguises) "aspirate" ought to be a H. G. "soft" (voice); a Teutonic "soft" a H. G. "hard" (breath); and a Teutonic "hard" a H. G. "aspirate." But while in applying the law as between Sanscrit, &c., and General Teutonic, we find (waiving the point that the "aspirates" are not aspirates) normal regularity and obedience, in touching the H. G. we are at once confronted with caveats, qualifications, and exceptions without end. Thus the rule fails initially in Teut. "aspirate" = H. G. soft; for though TH becomes D (as it has a habit of doing all over the world), F never becomes B, nor H ever G. It is only, indeed, in positions where the real Teutonic sounds were not F and H, but V and Gh, that the change took place. *Fader* did not become *Bater*, nor *hafoth*, *Gabor*, though *ofer* = *over* became *obar*, *ganoh* = *ganogh* became *gerug*. This is, on the face of it, something very different from FUGO = BEO, HOMO = GUMA. Then it fails also in Teut. "hard" = H. G. "aspirate," for while c becomes ch at end or middle of words, in all except a few outlying varieties of dialect, it remains c (k) initially; while p has become f (the general Teutonic "aspirate") finally, it remains pf, O.H.G. ph, initially; and above all, T has become no aspirate, but initially ts, sinking finally to ss, compounds or substitutes which have nothing akin to "aspiration" as used of the General Teutonic th, and which appear in "Grimm's Law" under that title only to muster apparent facts to pad out a theory a world too big for them. The fact is that, while the three Teutonic voice-letters g, d, b, shrink in H.G. into the voiceless x, t, p, the behaviour of the other six sounds is neither in accordance with "Grimm's Law," nor uniform among themselves.

2. But the High-German forms are recent; we have evidence to show that they came into being some centuries later than the Christian Era, and that therefore to class them with the mutations between Sanscrit and Teutonic generally, and spin theories for the co-existence of the three classes in the Aryan *holetnos*, is historically absurd. Many Latin words were adopted by the Germans during their relations, warlike and

otherwise, with Rome; they are now found in all the Teutonic tongues, and in these they have the same changes as the original Teutonic words have. They were, therefore, in the common language before it fell into dialectal divisions. Now, the Old High German form of these words, as compared with the Latin and General Teutonic, presents the same *laut-verschiebung* as Teutonic words. Thus the Latin (*via*) *strata*, is in L.G. *strata*, A.G. *straele*, but O.H.G. *straza*, Mod. *strasse*; the Lat. *tabula*, L.G. *taft* = *tavi*, A.G. *taeff*, is in O.H.G. *zabal*, just as Teut. *water*, A.G. *wæter*, is in O.H.G. *wæzzer*, Mod. *wasser*. The same causes which made certain Southern speakers of German say *straza* for *strata*, *zabal* for *taft* (which we know to be a real change), made the same men say, and at the same time, *wæzzer* for *water*, *zung* for *tunge*. So also the Latin *papa*, *pondo*, *camp(us)* *calic(em)*, *draco*, L.G. *papa*, *pund*, *camp*, *caelic*, *draca*, become in H.G. *pfapo*, *phunt*, *camph*, *kelih*, *tracho*: precisely the changes, and all the changes, which "Grimm's Law" deals with between General Teutonic and High German. The number of these examples might be multiplied, but it is unnecessary. What do they proclaim to him that hath ears to hear? That when Southern Germans heard *strata*, *papa*, *camp*, *draco*, they were unable to pronounce them, but must mangle them into *straza*, *pfapo*, *camph*, *tracho*? Nothing of the kind; on the contrary, they were fond of p, t, k, substituting them for b, d, g. That they had a "linguistic consciousness" that from the dispersion of the Aryan race they had used ts for L.G. t, ph or pf for L.G. p? Why not a "linguistic consciousness" of "Grimm's Law" itself, that Latin k, t, p = H.G. g, d, b, and that their words ought to be *strada*, *baba*, *gamb*? The suggestion is preposterous. What the facts proclaim is, that when these Latin words were adopted by the Germans, there was no High German dialect, or at least that it had not developed its consonant perversions; when at a later time, somewhere before the eighth century, that peculiar pronunciation of the Teutonic tongue arose, it assailed impartially Old Teutonic and recently-adopted Latin words. There were no philologists to point out the difference; it was a question of ears and mouths, not of derivation. Here also we dispose of the question whether Moeso-Gothic, the oldest form in which the Teutonic speech has been preserved, is High or Low German. It is neither or both: it is anterior to the division; and, therefore, the Goths, though presumably Southern Germans, who found themselves nearest to the confines of the Empire, knew nothing of the High-German consonant-changes; their tongue was "Low German"—i.e., common original Teutonic.

3. If asked why or how the altered pronunciation of High German arose, I look around me at present facts, and hear the Welshman in his first attempts at English say "Koot tay, koot shentleman!" or the Frenchman, "Dis tick vall;" I hear the consonant-changes which negroes or coolies make upon English; I see dialects like the Talkeetalk of Surinam, in which these changes are perpetuated. And reasoning from the known to the unknown, I have no difficulty in understanding how with the conquests of the Germans southwards their language may have been imposed on the original (say Slavonic) natives, from whose imperfect utterance the peculiar High-German pronunciation may have arisen. "Thih cot lopemes" in the O. H. G. *Te Deum* irresistibly suggests to me the Highland cateran's "Te shutshment tay! coot cot, Shon! tat pe coot long crettit; we'll een pe hafin' a pit for Shamee too!" This was *laut-verschiebung* (and *eigenthum-verschiebung*, too). The Slavonic idea is strengthened by the nature of many of the changes, most of all by the change of t into ts, a change foreign to Teutonic, but common in West Slavonic, as seen for example in the common *gratz* for the older *grad* and *gorod*. I can imagine a people who did not possess the continuant series of gh, dh, bh, but substituted for them some form of g, d, b, as negroes put *dat* for Eng. *that*; as

Spaniards said and say *bibo* for *vivo*, *bos* for *vos*; or as Englishmen, to go no further afield, say *lock* for *loch*, *akos* for *ayos*; that, to be distinct from these, the voice (soft) mutes were whispered as in *stadt*, *etab*, and, coming thus too near the breath (hard) mutes, the latter were forcibly jerked to keep them distinct, the jerk of *p* becoming *ph*, then *pf*, then (finally) *f*; that of *t* generating *ts*, sinking at length into *s*. As is well known, *pf* and *ts* still remain at the beginning of a syllable, but have sunk into *f* and *s* at the end, where the forcible utterance would be more difficult to maintain. Moreover, it is only in the most Southern fragments of O. H. G. literature that the chief changes take place. It is only in the frontier *patois* of Kero of St. Gallen, the Wessobrunner Gebet, Muspilli, &c., that we find *cot*, *keist*, *kiporan*, *paum*, *plomo* (*Gott*, *Geist*, *Geboren*, *Baum*, *Blume*). Louis the German and Charles the Bald did not so speak; Otfrid, Notker, the authors of *Hildebrand* and of the *Kaiserchronik*, did not so write: the "High-German" peculiarities on which Grimm founded his law are disowned by all the normal High-German writers.

I do not expect that this particular suggestion as to the origin of the High-German consonant-mispronunciation will satisfy everyone: it satisfies me, and I offer it as a solution which is possible, and which cannot be disproved. But I hold that it has been shown conclusively that the changes between General Teutonic and O. H. G. are not the same as those between Sanscrit and Teutonic; that they are later, derived, and dialectal; and that the attempt to show algebraically that General Aryan "hard" = General Teutonic "soft" = particular High German aspirate, all functions of each other, "none anterior to the other in time or superior in importance," is "the baseless fabric of a vision," and that "Grimm's Law," as concerns the relation between General Teutonic and its O. H. G. dialect, is a misapplication altogether. In conclusion I would add that the fact that the Old High German preserves many archaic grammatical forms which even Mosso-Gothic had dropped before the fourth century is perfectly consistent and harmonious with its altered consonantal system. The tendency to preserve archaic forms in transplanted dialects is well known. In the south-east corner of Ireland there existed to the present century a form of English introduced there by the first English settlers. While this outlying English of Forth and Bargo had undergone notable consonantal changes from contact with the native Irish, it had preserved Early English inflections, especially in the verb, such as we find in the *Ancren Riwle* in the thirteenth century. Had no written specimens of Southern English before, say, the fourteenth century come down to us, this dialect would have been grammatically the oldest English known, but it would have been quite delusive to hold that its consonantal changes were equally ancient. It is, of course, worth consideration whether the proved derivation of the High-German forms from the General Teutonic may illustrate the earlier relations of Teutonic to Aryan in general; but in order that they may do so, we must understand what are the facts, and not manipulate *formulae* of equality in which symbols that purport to indicate certain fixed relations really disguise relations different alike in physical character and historic origin.

N.B.—Since writing the above I have found that the lateness of the High-German consonant changes, and the absurdity of dealing with symbols instead of sounds, were admirably shown in an article in the *Westminster Review* for July, 1872.

J. A. H. MURRAY.

ON THE ESSEX WORD "RELEET."

Cambridge: February 26, 1878.

The word *releet* is a well-known Essex word for a meeting of roads: a *two-releet* is a place where two roads meet; and a *four-releet* means a place

where four roads meet. It has been a puzzle to me for years, but at last I can account for it. We find, in Anglo-Saxon, the expressions "*tō wega gelæstum*," i.e., to the meetings of ways, Matt. xxii., 9; "*æt þæra wega gelæte*," at the meeting of the ways, Gen. xxxviii., 21. Bosworth's *Dictionary* also gives "*twēgra wega gelætu*," meetings of two ways, from a copy of Ælfric's *Glossary*. Now, the A.-S. prefix *ge-*, as usual, counts for nothing, and the forms *lætum*, *læte*, *lætu*, may be substituted for the above. A place where two ways meet would thus be expressed by *twēgra wega lætu*; and a place where four ways meet by *feowera wega lætu*. Of course *wega* was easily dropped; and hence *twēgra lætu* is the A.-S. form of *two-releet*, and *feowera lætu* is a *four-releet*. The interesting point is that the prefix *re-* is due to the fact that the genitive plural of adjectives and numerals once ended in *-ra*. It is a splendid example of preservation of old grammar in a dialect. I may add that the simple form *leet* also occurs, in the sense of a meeting of cross-roads, in the South of England. The etymology is from A.-S. *lædan*, to lead. WALTER W. SKEAT.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, March 4.—2 P.M. Royal Institution: General Monthly Meeting.
 5 P.M. London Institution: "The Ice Age in Britain," by Dr. A. Ramsay.
 5 P.M. Musical Association: "On the Gallin-Paris-Chevé Method of Teaching considered as a Basis of Musical Education," by G. Bullen.
 8 P.M. Victoria Institute: "Monotheism," by the Rev. Dr. Rule.
 8 P.M. British Architects: Special General Meeting.
 8 P.M. Society of Arts (Cantor Lecture): "Application of Photography to the Production of Printing Surfaces and Pictures in Pigments," by T. Bolas.
 TUESDAY, March 5.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.
 7 P.M. Statistical: Adjourned Discussion on Mr. Mundella's Paper.
 8 P.M. Civil Engineers: "The Hooghly Floating Bridge," by Bradford Leslie.
 8.30 P.M. Zoological: "On the Crustaceans from the Coast of Coromandel collected by Sir Walter Elliot," by C. Spence Bate; "Notes on some Coleoptera of the Genus *Plusiota*," by A. Boucard; "On a small Collection of Lepidoptera obtained by the Rev. S. J. Whitmee at the Ellice Islands," by A. G. Butler.
 8.30 P.M. Biblical Archaeology: "Chaldeans, Pelasgians, Hyksos and Celts," by E. de Bunsen; "On the Assyrian and Babylonian Names for Copper and Brass," by Prof. F. Lenormant.
 WEDNESDAY, March 6.—7 P.M. Entomological.
 8 P.M. British Archaeological: "Excavations on West Stow Heath," by H. Prigg; "Early Interlaced Crosses of England," by J. Romilly Allen.
 8 P.M. Society of Arts: "An Electric Lamp-lighting System," by St. G. Lane Fox.
 8 P.M. Microscopical. Geological.
 THURSDAY, March 7.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.
 7 P.M. London Institution: "Chamber Music," I., by Prof. Ella.
 8 P.M. Chemical.
 8 P.M. Linnean: "On new Species of Nudibranchiate Mollusca from the Eastern Seas," by Dr. C. Collingwood; "Laws governing the Production of Seed in *Wistaria sinensis*," by T. Meehan; "On the Development of *Filaria sanguinis*," and "On the Mosquito considered as an Intermediate Host," by Dr. P. Manson; "Fungi of the Arctic Expedition," by the Rev. M. G. Berkeley; "On the Life-history of *Filaria Bancrofti*," by Dr. T. Spencer Cobbold.
 8.30 P.M. Royal. Antiquaries.
 FRIDAY, March 8.—8 P.M. Astronomical. Quekett.
 8 P.M. New Shakspeare Society: "On *As You Like It*," by H. Courthope Bowen.
 9 P.M. Royal Institution: "Influence of geographical Circumstances on political Character," by Prof. Goldwin Smith.
 SATURDAY, March 9.—3 P.M. Royal Institution: "Carthage and the Carthaginians," by R. Bosworth Smith.

SCIENCE.

The Natural History and Antiquities of Selborne. By the late Rev. Gilbert White. Edited by Thomas Bell, F.R.S., &c. In Two Volumes. (London: John Van Voorst, 1877.)

Two English prose-writers stand apart as interpreters of the poetry of rural life—Isaak Walton and Gilbert White. Of the latter's *Natural History of Selborne* an eminent naturalist and scholar has well observed that it is the only zoological work

which has gained for its author the position of an English classic. It is in truth not only a wonderfully clear and complete treatise on the natural productions of a typical English parish—it is a prose pastoral, musical with the song of birds, and fragrant with the breath of wild flowers. Once under the spell of Gilbert White, the Hanger and the hollow lane leading to Alton become our favourite haunts, and Timothy, the tortoise, is our ancient familiar friend. Under the guidance of the good old parson we learn the mysteries of rush-light making from a village dame; we visit the idiot boy who exercises such a strange mastery over bees; we listen to the sibilous shivering song of the *regulus non cristatus* in the high beechen woods, and search for the *herb Paris* in the Church Litten Coppice. Then, when the shades of evening begin to deepen, when the jarring notes of the churn-owl are heard and the vast great bats (still nondescript) are high in air, we return to the great parlour, to trace the history of the Priory from the days of Bishop de Rupibus downwards, and to discuss the latest works of Linnaeus and Scopoli. No other writer has done so much to make the study of nature popular in England, and it is no wonder that edition after edition of the *Selborne* has been called for, and that it has been revised and annotated by some of the best naturalists of the present century.

No former editor, however, has enjoyed such advantages as the veteran zoologist to whom the preparation of the present volumes has evidently been a labour of love. After a distinguished career in the front ranks of English science, Mr. Bell has made *Selborne* his retreat for more than thirty years, he has lived in White's own house, and has been entrusted with all the correspondence and unpublished notes which have been preserved by the family. Consequently he has been able, not only to edit White's writings with an intimate local knowledge of the scenes and objects described, but also to add largely to our knowledge of the "life and conversation" of the great field-naturalist.

The first volume of the present issue contains White's published works, including the *Natural History*, *Antiquities*, *Naturalist's Calendar*, *Observations*, and *Poems*, the text of the early editions being reproduced, and even the occasional peculiarities of spelling and the free use of italics being preserved. Unlike some previous editors, Mr. Bell has avoided overloading his pages with unnecessary and lengthy notes. Indeed, it appears to us that he has erred in the opposite extreme—for example, the error as to the hedgehog eating plantain-roots should surely have been corrected. An account of the re-planting of Wolmer Forest would have been of interest; and is Mr. Bell quite accurate when he says that the black grouse now found there are "not the result of any recent importation from other localities, but voluntary visitants"? That some may be so is not impossible, but Captain Feilden has recorded the fact that a number were imported when Sir Charles Taylor was ranger, and the man who brought them from Cumberland was still living at Liphook in 1872. On the whole, however, the notes, though brief, are to the point; and many of

them are interesting as showing the persistence with which some species frequent the exact localities which their progenitors affected a century ago.

The second volume is devoted to White's correspondence and to extracts from his sermons, account-books and "Garden Kalendar." To these are added lists of the more noteworthy animals and plants of the district, by the editor; a chapter on the geology, by Mr. W. Curtis; and an essay on Roman-British antiquities, by Lord Selborne. This last has already appeared in Mr. Buckland's edition, as have a few of the letters to the Barker family. Some of Linnaeus' letters to the Rev. John White have before been printed in the "Contributions to Ornithology," and the correspondence with Marsham was published in the *Transactions of the Norwich Naturalists' Society*, and in the second issue of Mr. Harting's edition; but the remaining contents of this volume are now given to the public for the first time. The correspondence does not contain any important observations which were not incorporated in the *Natural History* (except the record of the occurrence of the wall-creeper in England); but they throw a very pleasing light on White's intercourse with his relatives and his scientific friends. He writes mostly of family matters and of his own favourite pursuits, and only very rarely refers to public affairs; but the outbreak of the French Revolution draws from him the exclamation (in a letter to Marsham):—"You cannot abhor the dangerous doctrines of levellers and republicans more than I do! I was born and bred a Gentleman, and hope I shall be allowed to die such." Mingled with quaint Pepysian scraps of family life and village gossip—such as the arrival of his brother John's "curious box of birds, shipped in October, and Jack's shirts and sweetmeats;" and the record that "Rich. Butler the thatcher is going to enlarge his house"—we have bits of wise advice and shrewd observation. Many naturalists of to-day would do well to remember the warning, "Don't be too hasty in pronouncing any species a nondescript." And many publishers would agree in the recommendation to an intending author to "produce ingenious dissertations to entertain the unsystematic reader;" and endorse "Brother Ben's" advice to "have as many plates in your Fauna as possible; for it is the fashion now to look in picture-books." Altogether the correspondence confirms the world's estimate of Gilbert White, and shows him to have been a thoroughly lovable man, as well as an admirable essayist and an unequalled observer of nature.

Mr. Bell's edition is handsomely printed, and the plates illustrating White's house and favourite walks are well executed. We regret that no system of cross references has been adopted; that there is no separate index to the first volume, and that the general index is very incomplete. In every other respect these volumes are fitted to fill the hitherto vacant place of a standard edition of White's works, and are worthy of both the author and the editor.

EDWARD R. ALSTON.

ANGELO SECCHI.

On Tuesday, February 26, died Father Secchi, the director of the Observatory of the Collegio Romano, and his death will be regretted in many circles as that of a zealous and industrious, and at the same time a genial, man of science. Born June 29, 1818, at Reggio (the town on the road between Parma and Modena), he entered in early youth the Order of the Jesuits, and received his education at their college near Loreto, and afterwards at their Georgetown college near Washington. At the latter institution he was for some time Professor of Physics and Mathematics, but was soon recalled to Italy and made Professor of Physics at the Collegio Romano at Rome. After the expulsion of the Jesuits, in 1848, Secchi travelled in France, England, and America; but was, after the restoration of the Pope, reinstated in his professorship, and superintended, some years later, the building of the new observatory of the Collegio Romano. The erection of a modern observatory on the top of a church appears at first rather strange and objectionable; but the circumstances were exceptional; the connexion with the college on the one side, the sanitary conditions of the neighbourhood of Rome on the other, rendered other devices undesirable, and the difficulty was then successfully solved by placing the new observatory on the top of some enormous pillars, which had been erected for the purpose of supporting a very lofty and massive dome, but had been left in an unfinished state. Provided with excellent instruments, Secchi has worked indefatigably in his new abode during the last quarter of a century. Hundreds of papers from his busy pen are to be found scattered in the scientific periodicals—the *Astronomische Nachrichten*, *Comptes Rendus*, *Monthly Notices of the Royal Astronomical Society*, Palomba's *Raccolta di Lettere*, Tortolini's *Annali*, the *Atti Accad. Nuov. Linc.*, *Il Nuovo Cimento*, the *Bibliothèque Universelle*, and others. They refer chiefly to observations of planets, comets, double stars, and to different branches of solar and stellar physics, photometry, photography, polarisation, &c., and they show that Secchi was fairly at home in several sciences. His observations were for a series of years published in the *Memorie dell' Osservatorio dell' Università Gregoriana del Collegio Romano*. In wider circles taking merely a general interest in science, Father Secchi is perhaps best known by his book *Le Soleil*, published in 1870. He had begun to publish some portions of it in Italian; but had also given some lectures on the subject during his visit to the Paris Exhibition of 1867, at the Ecole Sainte-Genève, which were received with so much applause and satisfaction that he was prevailed upon to prepare and publish the whole work in French, from which it has been translated into several other languages. If in some respects exception has been taken to the work, it may be mentioned that the author expressly states:—

"Nous ne nous bornons pas à exposer nos propres travaux; nous prendrons le vrai et le beau partout où nous le trouverons. Mais nous n'énoncerons aucune opinion sans avoir vérifié par nous-même les faits sur lesquels elle repose; nous n'exposerons aucune théorie sans l'avoir constatée autant que le comporte la nature même du sujet."

The appearance of a new work of Secchi, *Le Stelle*, has been lately announced, and it is stated that his unpublished writings abound in matters of scientific interest.

The urbanity and geniality of his disposition gained Secchi many friends. It is reported that, when lately interrogated as to how he reconciled science and religion, he said: "In the former I follow Nature, in the latter the Pope." This saying vividly calls to mind the progress which this reconciliation has made even among the Fathers. When, in the last century, a predecessor of Secchi, Father Boscovich, Professor of Mathematics and Philosophy in the Collegio Romano, wrote his dissertation on Comets, he had to

guard himself against unpleasant consequences by writing in the following strain, which is well worth remembering:—

"Newtonus quidem terram movet. At nos sacrarum litterarum testimonia venerati et Sacrae Romanae Inquisitionis decretis obsequentes immotum statuimus, ejusque motum non nisi in speciem tantum retinemus facillioris delineationis gratia, illud simul demonstrantes, sive terra circa solem moveatur, sive cum sole cometarum orbitae circa terram immotam circumferantur, eadem prorsus phaenomena provenire, easdemque motuum causas, ac vires corporum perseverare."

However much it is to be regretted that Secchi should have been cut off in the midst of a most useful career, it is at least consoling that death has released him from the sufferings of a painful and incurable illness.

A. MARTIN.

SCIENCE NOTES.

GEOLOGY.

The Fossiliferous Rocks of Western Scotland.—Much has lately been done by the labours of Prof. Judd to throw light upon the geological history of the West of Scotland and the neighbouring islands. Geologists, to be sure, have been acquainted for more than a century with certain scattered patches of fossil-bearing strata which take their place somewhere between the old Gneissic rocks and the masses of Tertiary lava in the Hebrides. But still the gaps in the series of strata have been so large and so numerous that the geological record in this part of the country has appeared extremely imperfect. Prof. Judd, however, has been able to show that not only is the Jurassic system represented with great completeness in the Western Highlands, but that many other Secondary rocks are associated with this system. It is true that neither the Upper Oolitic nor the Neocomian formation has yet been detected; but the Cretaceous strata are there, and, although not well situated for observation and not presenting any great thickness, are nevertheless of surpassing interest. At the base are marine deposits of Upper Greensand age, covered by strata of Chalk, from which, however, they are separated by sandstones, containing thin coal-seams. As to the Jurassic series, they may be traced in fragmentary patches which indicate what must once have been a most noble development of these rocks; indeed, the most stinted estimate can hardly assign to them a thickness of less than 3,000 feet. Some of these Jurassic strata are of extreme interest, and it would, in fact, be difficult to point to any spot in the British Isles which shows a better development of the Infra-Lias. But this is not all. The Poikilitic series—a name which has been conveniently revived of late years by Phillips, Woodward, and some other writers, to include all the rocks between the Coal and the Rhætics, otherwise known as Permian and Triassic strata—has been discovered in the shape of conglomerates, marls, and sandstones reaching to a thickness of 1,000 feet. And in one locality Prof. Judd has had the good fortune to light upon true Coal-measures, consisting of sandstones, shales, and coal-seams, which contain the familiar *Lepidodendron*, *Sigillaria*, and other characteristic plants. Mr. Carruthers has pointed out that these vegetable remains leave no doubt as to the age of the rocks; they belong, indeed, to the upper and middle coal-measures. In fine, the rocks between the old Gneiss series and the Tertiary lavas, of which so little has hitherto been known, are now found to represent a series of strata having a total thickness little short of a mile. And yet the existence of this magnificent series is indicated only by a few scattered patches which by a combination of accidents have escaped destruction during the enormous amount of denudation which the country has suffered. Prof. Judd's researches have lately been laid before the Geological Society in continuation of his work on the *Secondary Rocks of Scotland*.

The Old Man of Hoy.—It may not be amiss to explain at once that Hoy is one of the Orkney Islands, and that the "Old Man" is a huge pillar of rock which has been worn away from the cliffs and now stands out at sea, all but completely isolated. Prof. Geikie has contributed to the February number of the *Geological Magazine* a pleasing article on the geological structure of this natural monument, so rarely visited by geologists, and yet so striking as an illustration of denudation. The "Old Man" is composed of yellow and red sandstone, almost horizontally stratified, belonging to the Upper Old Red series. This sandstone rests unconformably upon a base of older upturned strata, which belong to the Caithness flagstones. Between these strata and the sandstone there lies a thick band of dark-coloured amygdaloidal lava, forming, in fact, part of an old sheet which represents a local volcanic outburst in late Devonian times. It need hardly be added that Prof. Geikie's article, though but slight, is written in that peculiarly charming style of which the author is an acknowledged master.

Relation of the Structure of Crocodiles to the Nature of their Prey.—In a paper recently laid before the Geological Society, Prof. Owen called attention to the influence which might be exerted by the advent of a higher form of life in modifying the structure of an older and lower form. This he illustrated by reference to the history of the Crocodilia, and pointed out the structural changes which they had undergone, probably in relation to the altered character of their prey at different epochs. The author inferred that cold-blooded aquatic animals must have formed a larger proportion of the food of crocodiles of Secondary age than of those of later times. In the former the dorsal vertebrae are amphicoelian, or biconcave, like those of a fish; while in the latter they are procoelian, or concave in front. As the procoelian type is better fitted for rapid motion on land, it is suggested that it may have been connected with the advent of mammalian prey in the Tertiary period. Again, the Mesozoic crocodiles were encased in stronger armour than that worn by their successors. In fact, the Mesozoic forms needed pretty strong casings in order to protect them from the ichthyosaurs and other formidable saurians which lived in the same waters; while the procoelians required to be lightly clad in order to move rapidly on land in quest of mammalian prey. Further, the differences in the position of the palatognathus is apparently connected with differences in the character of their prey; and the backward position of these apertures in a post-Secondary crocodile would give it the power of holding a mammal submerged without itself suffering inconvenience. Even such massive-jawed crocodiles as the Purbeck species, *Goniopholis crassidens*, probably subsisted on a fish-diet, since they did not possess the palatal structure necessary to enable them to deal with active mammalian prey. Moreover, the strictly aquatic habit of the Mesozoic crocodiles is indicated by the shortness of their fore-limbs, which facilitated rapid swimming; while the larger limbs in the later forms are better fitted for progression on land. On the whole the structural characters of Tertiary and recent crocodiles evidently gave them an advantage over their predecessors in the capture of terrestrial prey.

More New Tertiary Vertebrata from the Western Territories.—Dr. Cope's zeal in vertebrate palaeontology is by no means flagging, as his recent publications on this subject sufficiently show. In several papers lately laid before the American Philosophical Society, copies of which have been forwarded to us, he describes a large number of new species, and a few new genera, obtained from the rich deposits in some of the Territories of the West. Many of the descriptions, though of interest to the scientific palaeontologist, are of too technical a character to need notice in these columns. More information is

given respecting the remarkable genus *Camarasaurus*, from the Dakota beds of Colorado. This monster, which is believed to have been the most bulky animal of which we have any record, possessed a very long neck and had large anterior limbs, whence it is concluded that though a Saurian, it may have resembled in general form and habit the giraffe. It thus differed from some of the later Dinosaurs, which are supposed to have elevated themselves on their hind limbs, in bird-like fashion, in order to reach the tree-tops on which they browsed.

Geology of the Uinta Mountains.—As an illustration of the energy displayed by the Geological Survey of the Territories, we may point to the issue of a beautifully-printed Report by Prof. Powell, on the Geology of the Eastern portion of the Uinta Mountains and the adjacent country. There can be no question about the great scientific interest of the region which is here described. Rocks of Palaeozoic, Secondary and Tertiary age, forming an aggregate of some 50,000 feet, have been subjected to displacements of enormous magnitude, the effects of which have been singularly well preserved for observation. In addition to a vast amount of local details, the Report contains some interesting facts in geological dynamics. The Uinta range has been produced by the upheaval of a great block of country, having an east-and-west axis, which has since been carved into shape by denudation. Along the axial line, which is curved, the total upheaval above sea-level has been about 30,000 feet. It is estimated that, on an average, about $3\frac{1}{2}$ cubic miles of solid matter must have been removed by rain and rivers from every square mile of surface. The Report is accompanied by some excellent illustrations, including several "stereograms," which give a most graphic representation of the physical features of the country.

Geological Work by Local Scientific Societies.—We have received a copy of the last part of the *Proceedings* of the Geological and Polytechnic Society of the West Riding of Yorkshire—a society which is henceforth to have a wider sphere, and to extend its work to the whole of the county. The part now before us has been issued in a manner highly creditable to its editor, Mr. J. W. Davis. It contains ten papers, including an interesting address on Scientific Research by the Marquis of Ripon. As should always be the case with such publications, most of the papers are essentially local in character. They serve, however, to show how widespread the taste for geological study has become. In this connexion, too, we may call attention to the *Transactions* of the Cumberland Association for the Advancement of Science, of which we have recently received the second part, edited by Mr. Clifton Ward, of the Geological Survey. This capital number includes several papers of local geological interest, and also extends, as the name of the society implies, to other sciences, and even to literary subjects.

METEOROLOGY.

Comparison of the Standard Barometers at Kew and Greenwich.—At a recent meeting of the Royal Society a paper by Mr. Whipple was read giving an account of a series of comparisons between the standard barometers at these two observatories. It has repeatedly been maintained by foreign meteorologists, and also by the late Colonel Strange, that a material difference existed between the instruments, and, accordingly, the Kew Committee obtained the consent of the Astronomer Royal to a direct comparison. Four travelling barometers were employed, and the mean of 344 comparisons showed that Greenwich read 0.0012 in. above Kew. This difference is exactly one-fifteenth of that alleged by Prof. Wild to exist. Mr. Whipple was led to suspect that the reason of individual readings giving somewhat discordant values was to be found in the fact that

the Greenwich barometer is read by gaslight turned on when required. He found, by suspending thermometers close to the barometer and turning on the gas full for five minutes, that the temperature of the scale part of the instrument could be raised $7^{\circ}.1$, while the attached thermometer only rose $0^{\circ}.8$. It is obvious that in the case of a chance reading, if the observer be slow, a material difference might have been made in the reading obtained. We are glad to learn that the gas-jets have now been shaded so as to diminish the evil.

The Meteorological Society.—The last number of the quarterly *Journal*, for October last, has just appeared. It is unusually late, but this may perhaps be pardoned when we say that it is perhaps the most valuable part which has ever appeared. The most important paper is one by Mr. Clement Ley on the motion of the air in cyclones as shown by cirrus observations. This is illustrated by a series of synoptic charts for the month of March last, giving the motion of surface winds, and of upper currents. The other papers of value are: one by Dr. W. Marcet, F.R.S., on the climate of Cannes, in which he particularly studies the fall of temperature at sunset; and one from the Meteorological Office on the climate of the island of Rapä in the middle of the Pacific.

Study of American Weather - Maps.—Prof. Loomis has published in *Silliman's Journal* for January his eighth paper on this subject, in which he takes up the origin and development of storms. He says that the predisposing causes for all barometrical depressions are the existence of two areas of high pressure situated respectively on the west and east side of, and at a distance of about 1,000 miles from, the place of origin of the storm. In some cases there were as many as four areas of high pressure, and whenever at least two were not traceable this was owing to the insufficient extent of the region represented on his map. Two such areas give off air which tends to flow towards a central point, its direction being modified by the rotation of the earth, and so an incipient whirl is set on foot. Rain is not the first cause of cyclonic movements, but is observed in all serious storms. Once the cyclonic movement is started, an upward current is produced at its centre, and the central rarefaction is increased by the heat set free by the condensation of vapour. If the wind becomes violent the shape of the area of depression may become sensibly circular. Prof. Loomis then proceeds to show that the motion of the storm is always in the direction of the general system of atmospheric circulation, and this holds good between the Tropics as well as in the Temperate Zone. He shows that great storms are not confined to any particular locality, but one half of them originate at, or near, the Rocky Mountains.

Meteorology of Russia.—Prof. Wild has just published his last biennial Report, for the years 1875-6. The most important changes in organisation which he has to chronicle have been the establishment of a central observatory at Pawlowek outside St. Petersburg, of which the foundation-stone was laid May 20, 1876, and the formation of a special department for Maritime Meteorology and Weather Telegraphy, which was carried into effect at the same period. The remarks which Prof. Wild makes with regard to thermometer exposure present some interest. He deals first with the sling thermometer, *thermomètre fronde*, and points out that the main feature of a satisfactory exposure should be that agitation of the air about the bulbs should produce no change of temperature; so that the rapid rotation of the instrument in question is not calculated to ensure true readings. In the sun he found its indications 1° or 2° C. too high. Prof. Wild expresses himself surprised with the generally satisfactory performance of a Stevenson's screen.

Meteorology of Denmark.—Captain Hoffmeyer has issued his annual Report for 1876, which con-

tains in addition to the returns from the regular stations, a discussion of the climate of Denmark for the last fifteen years on the basis of observations at four stations, Copenhagen, Tarm, Hindholm, and Smidstrup. There is also a paper by M. Hagemann on Anemometers, in which he proposes two new forms of apparatus, one so far resembling a Lind's anemometer that the pressure is measured by a column of water—i.e., by the change of level of a bell like a gasometer. The aperture intended to receive the wind is a Pitot's tube, which is turned by a vane to face the wind, and so acts by compression. The other instrument is called a Magnus tube; it is vertical and acts by suction like an odorator. The first arrangement is far preferable to the second for gusty winds, but M. Hagemann thinks that both principles might be used in anemometry.

Meteorology of Victoria.—Mr. Ellery has published his fourth Annual Report, for 1875, which hardly differs from that for previous years. In addition to the observatory at Melbourne, he has stations more or less completely equipped at Sandhurst, Ballarat, Portland, Port Albert, Cape Otway and Gabo Island.

Earth-Temperatures and their Increase with Depth.—The boring of the St. Gotthardt Tunnel has yielded some very valuable results on earth-temperature, which have been laid before the Swiss Naturforschende Versammlung by Herr Stapff, and are discussed by Dr. Hann in the *Austrian Journal* for January 15. If the observations be considered with reference to their vertical depth, we have a mean rise of 1°C . for 46 metres; but this varies very seriously in different parts. Thus, under Andermatt we find a rise of 1°C . for 21.8 metres. This would give a temperature of 77°C . for the centre of the tunnel! This exceptional result Herr Stapff attributes to the state of decomposition of the rock at the place, which is a granite turning into kaolin. Dr. Hann discusses these observations with great care, and points out the difference between these results and those of the bore-hole of Spereberg, which are generally thought the most accurate in existence, and give as result 1°C . for 33.7 metres. The paper concludes with a serious warning to physical geographers to the effect that there seems little prospect of learning anything of the true rate of internal increment of heat by these observations. We have only attained a depth of 1,269 metres, or about $\frac{1}{1000}$ of the earth's diameter. If we were to attempt to determine in the same way the law of diminution of temperature with height in the atmosphere, a similar proportion to the height of the atmosphere (60 miles) would be 22.16 metres, the height of an ordinary house. Hence our deepest bore-holes are mere scratches, and we really know nothing certain on the subject.

The Aurora and Weather.—Lieutenant Weyprecht has published in the *Denkschriften* of the Vienna Academy an elaborate discussion of the auroral observations taken during the Austrian Arctic Expedition. The greater part of the paper is not specially meteorological, but it is of interest to learn that a careful comparison of the observations of wind and barometrical pressure at and about the time of occurrence of auroral phenomena has failed to show any connexion between these displays and storms. This is of the more importance because in the published account of the expedition it was alleged that brilliant red auroras were always the precursors of storms.

DEATH has made another gap in the ranks of Swiss men of science. Prof. R. von Fellenberg-Rivier, of Bern, died at Cannes a few days ago at the age of sixty-eight. He was a companion of the late Emperor Napoleon III. at the artillery-school of Thun, and worked as diligently at the reconstruction of that establishment as he did later at the reorganisation of the Academy in Lausanne. Chemistry was his chosen province of

study; and after he returned to his native town he devoted himself almost exclusively in his private laboratory to those researches and experiments which procured him so high a reputation in the scientific world. In Switzerland, however, he was also known as a zealous palaeontologist and antiquary, and rendered much service by his extensive enquiries and his expert judgment upon ancient bronzes and stone implements. He was widely consulted on all matters in which he was an adept, on account of the liberal and ungrudging spirit with which he imparted to others the results of his own enquiries and experiments, and the warm interest which he took in all persons who were pursuing similar investigations. He was one of the most active members of the Naturforschende Gesellschaft, and was repeatedly chosen as its annual president.

MEETINGS OF SOCIETIES.

SOCIETY OF ANTIQUARIES.—(Thursday, February 14.)

F. OUVAY, Esq., President, in the Chair. Mr. Bragge exhibited some pipes from the mounds in Ohio, made of sandstone, baked clay, steatite and black limestone. One was egg-shaped, and the others consisted of a bowl and short stem for the insertion of a reed, but none of them were in the shape of birds or animals, which are often found in the mounds. Mr. Borlase exhibited another, in the shape of a funnel, with a hole for the stem at the bottom. This specimen was covered with markings, chiefly squares and chevrons, which are considered by the Mormons to be Hebrew characters, and an evidence that the American aborigines are the lost tribes of Israel. The markings are similar to those on some funnels found by Dr. Schliemann at Hissarlik.—Prof. Stephens, of Copenhagen, exhibited a chemotype of an ebony pax, purchased in Copenhagen. He considered it as representing Christ carrying his cross, while a saint is holding the handkerchief of St. Veronica impressed with the holy face. What is supposed to be the handkerchief looks, however, far more like a picture on panel.—Mr. Franks presented to the society an impression of the seal of the Chapter of Cordova, in red wax, inclosed in a cup of white wax. The design represents the Virgin and Child—the former holding a palm—and kneeling ecclesiastics below. It dates probably from the end of the thirteenth century.

LONDON MATHEMATICAL SOCIETY.—(Thursday, February 14.)

LORD RAYLEIGH, F.R.S. President, and subsequently Mr. C. W. Merrifield, F.R.S., V.P., in the Chair. The secretary read a portion of a paper by Prof. H. W. Lloyd Tanner, "On a General Method of Solving Partial Differential Equations." The general method of solving such equations of the first order consists in forming n equations—including the given one—such as to render

$$dx - p_1 dx - \dots - p_n dx_n = 0 \quad (a)$$

an integrable equation. These equations are found by solving certain partial differential equations usually written briefly $[F, F] = 0$ (b). The object of the paper is to deduce a system equivalent to (b) directly from the conditions of integrability of (a). Such a system is, in fact, obtained, and precisely the same form of equation serves to integrate equations of the second order. It is shown that only one system of the kind just mentioned has to be integrated in order to get a final integral of an equation or system of equations, although some of them may be of an order higher than the first. When dealing with equations of the second or higher orders, it is necessary to solve a second set of auxiliary equations which have no analogue in the theory of equations of the first order. One system of this kind must be solved before passing to the first integral, another before we can get a second integral, and so on. No such system has to be solved before passing from the penultimate integral to the solution. The results obtained in the paper are applicable to systems of simultaneous equations of the same or different orders. The secretary then read part of a paper by Prof. H. Lamb (Adelaide), "On the Conditions for Steady Motion of a Fluid." It gives the general conditions necessary and sufficient in order that a given state of motion of a fluid should be a

possible state of steady motion. Particular cases of the conditions were given by Stokes in the Cambridge *Philosophical Transactions* for 1842. Mr. A. B. Kempe communicated two notes, "On a Property of the Four-piece Linkage," and "On a curious Locus in Linkages."—Mr. S. M. Drach read a paper "On Robert Flowers' 'The Radix,' a new Mode to Compute Logarithms." (It will be in the recollection of readers of the *ACADEMY* that Mr. A. J. Ellis, F.R.S., drew attention to this forgotten tract, published in 1771, in No. 285, October 20, 1877.) The author stated that this method appeared to be a great improvement on Mr. John Long's direct method of computing logarithms, *Phil. Trans.*, 1714 (see Hutton's *History of Logarithms*).—Prof. H. J. S. Smith, F.R.S., gave a statement of results obtained in his paper "On the Pluckerian Characteristics of the Modular Equations."—Mr. Drach exhibited a large collection of figures of curves to which Mr. Perigal has given the name of "trircicoids." The figures were drawn many years ago.

PHILOLOGICAL SOCIETY.—(Friday, February 15.)

DR. J. A. H. MURRAY, V.-P., in the Chair. The paper read was by the Rev. W. E. Cousins, long a missionary in the Island of Madagascar, on "Malagasy, the Language of Madagascar." Mr. Cousins gave an account of the various contributions made by Europeans to the study and development of the Malagasy language, from the sixteenth century to the present time. The written form of the language now in use was introduced by missionaries of the London Missionary Society, about sixty years ago. Substantially one language is spoken throughout the whole of Madagascar, but various dialects exist. That spoken by the Hôvas is the principal and most cultivated dialect. The Sakalava is used on the west coast, and in the northern parts of the island; the Betsimisarakas is spoken on the east coast; and the Betsileo in the interior of the island, south of Imérina. The paper contained a description of the principal linguistic features of the Malagasy, and a short account of its unwritten literature, which consists chiefly of fragments of history, proverbs, and fables. The relation of the Malagasy to other languages was also discussed, and much evidence was adduced in favour of regarding it as the most westerly member of the Malayo-Polynesian family. Mr. Cousins showed that both in its vocabulary and in its grammar the Malagasy bears the closest affinity to this family. Without denying that an African element may exist in the language, Mr. Cousins maintained that no near relation to any African language has yet been proved to exist. At the same time he showed that many African words, among them the names of domesticated animals, have been introduced as the result of commercial intercourse. In the same way many Arabic, French, and English words have also become naturalised. After the paper, the meeting was addressed by the Rev. Dr. Mullens, and by two missionaries familiar with some of the Polynesian languages—viz., the Revs. S. J. Whitmee, of Samoa, and Moulton, of Tonga. Both these gentlemen bore decided testimony to the strong resemblances of the Malagasy, as described by Mr. Cousins, to the Polynesian languages generally.

PHYSICAL SOCIETY.—(Saturday, February 16.)

PROF. W. G. ADAMS, President, in the Chair. Dr. Lodge read for Mr. H. F. Morley, M.A., a paper "On Grove's Gas Battery." After referring to the views of M. Gauguin and Mr. Grove himself with regard to the cause of the action of this apparatus, the author proceeded to describe an elaborate series of experiments he has recently made in order to ascertain the circumstances by which it is regulated.—Mr. S. C. Tisley then described the "Harmonograph," especially referring to its use for drawing pairs of curves for the stereoscope.—Mr. Wilson exhibited for Prof. S. P. Thompson a Lantern Slide Galvanometer for showing the deflections of the needle to an audience.

ZOOLOGICAL SOCIETY.—(Tuesday, February 19.)

PROF. MIVART, F.R.S., V.-P., in the Chair. The Secretary exhibited the skin of a fine adult cassowary, which had been obtained at Wandammen, on the eastern coast of the bay of Geelvinck, New Guinea, and acquired by the British Museum. The species

to which it belonged was believed to be undescribed, and it was proposed to call it *C. altijugus*, from its peculiar high-peaked helmet.—Mr. P. Geddes read a memoir on the mechanism of the odontophore in certain mollusca. In this paper the view of Cuvier—that the movements of the radula depend upon those of the underlying cartilages—was substantially revived, arguments being adduced against the more recent theory of Prof. Huxley, that it runs like a chain-saw, the cartilages merely forming a pulley-block. The use of bacteria as food by *Lymnaeus* was also described by the author in this paper.—Prof. A. H. Garrod read some notes on the anatomy of *Tolypeutes tricinatus*, and gave remarks on other *Dasydodidae*. A new form of *Tolypeutes*, allied to *T. conurus*, was proposed to be called *T. Muriei*.—A communication was read from Mr. J. H. Gurney, containing notes on a specimen of *Polyborus*, lately living in the Society's Gardens.—A communication was read from Mr. D. G. Elliot, containing the results of his study of the *Petrochelidonidae*, or family of Sand Grouse. Nine species of *Petrochelidon* and two of *Syrhaptes* were recognised as composing the family.—Messrs. F. Du Cane Godman and Osbert Salvin gave descriptions of new species of Diurnal Lepidoptera from Central America.—Communications were read from Mr. R. Bowdler Sharpe, giving an account of a small collection of birds from the Ellice Islands; from Mr. Edward R. Alston on the dentition of *Cuscus*; from Mr. T. F. Cheeseman, containing the description of three new species of Opisthobranchiate Mollusca from New Zealand; two from the Marquis of Tweeddale: one containing an account of a collection of birds made by Mr. A. H. Everett, in the Island of Negros, Philippines, the second, a description of a new species of the genus *Buceros*, proposed to be called *B. semigaleatus*, from the island of Leyte, Philippines.—Dr. F. Day communicated some remarks on the paper read by Mr. Whitmee at the last meeting of the society, on the manifestations of fear and anger by fishes.

METEOROLOGICAL SOCIETY.—(Wednesday, February 20.)

C. GRAVES, Esq., F.G.S., President, in the Chair. Dr. Tripe read a paper on "The Winter Climate of some English Seaside Health Resorts." The places selected were Scilly, Torquay, Penzance, Guernsey, Barnstaple, Ventnor, Llandudno, Ramsgate, and Hastings; and the climatic features of each were compared with those of London. The results of this discussion may be briefly summed up as follows, viz.:—The mean daily winter temperature of these seaside places, and especially of those situated on the coasts of Devon and Scilly, is higher than at London. The mean daily maxima and minima are also higher, and especially the latter; so that the daily and monthly ranges of temperature are smaller. The mean humidity is less. The general direction of the wind about the same; but the number of rainy days and the rainfall are greater at the seaside. As regards the wind, therefore, the chief point to be specially noticed is the amount of shelter afforded by high land, as at Ventnor, and especially of protection against the stormy and cold winds which ordinarily prevail at the end of February and in March. The soil also should be considered, as heavy rains at gravelly and chalky places are not so objectionable as on clayey ground. The discussion on this paper was adjourned until the next meeting, which will be held on March 20.

ROYAL SOCIETY.—(Thursday, February 21.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On the Alteration of the Thermal Conductivity of Iron and Steel caused by Magnetism," by H. Tomlinson; "Chemical Notes: On the direct Formation of the Chlorobromides. Chlorobromide of Ethylene (C₂H₄ClBr)," by Dr. Maxwell Simpson; "Further Note on Supersaturated Saline Solutions," by C. Tomlinson; "Sur une équation différentielle du 3me ordre," by Prof. F. Brioschi.

LINNEAN SOCIETY.—(Thursday, February 21.)

W. CARRUTHERS, Esq., F.R.S., V.-P., in the Chair. Mr. Thomas Christy illustrated by diagrams and made some remarks on M. Ossenke's new system of plant-propagation; and he also exhibited specimens of the fresh berry of the Liberian coffee recently imported,

and of this year's crop.—Mr. E. M. Holmes exhibited and tendered observations on a remarkable oak-gall, the produce of *Aphilothrix Sieboldii*, Hart., obtained at Willesborough Leas, Ashford. He also laid before the society an example of *Duboisia myoporoides*, R. Br., from Brisbane.—Mr. Thielton Dyer exhibited the remarkable inflorescence and a drawing of *Phytosperma rupicola*, Thw., which had flowered for the first time in Europe at Kew.—The first paper read was by Mr. E. Lockwood, "Notes on the Mahwa Tree" (*Bassia latifolia*). These grow in abundance in India; a hundred thousand may be seen on the plains around Monghyr. Wild animals of all kinds greedily devour the flowers, of which one tree will bear several hundredweights. Besides being nutritious to man, it is an excellent fattening agent for cattle, pigs, &c. A strong-smelling spirit is obtained by distillation of the corolla, an essential oil from the fruit, and as an agent in soap-making the tree is invaluable. Thus certain yield, unlimited supply, nourishing and chemical qualities, easy preservation, and its cheapness, all combine to render it hereafter a commercial product of no mean importance to our Indian Empire.—The gist of a "Synopsis of the Hypoxidaceae," by Mr. J. G. Baker, was given. This group differs in some respects from the Amaryllidaceae, and offers a closer alliance with the Bellosicaceae. Four genera and between sixty and seventy species are now known. The Cape is their head-quarters, but some are found in Tropical Africa and Angola, a very few in Abyssinia and the Mascarenes. None are found in Europe, Polynesia, North and Central Asia, or in extra-tropical South America.—The secretary read an abstract of a technical paper "On the Schoepfiaceae and Cervantesiaceae, distinct tribes of the Styracaceae," by Mr. John Miers.—There followed a communication by Mr. Arthur G. Butler, "On the Butterflies in the Collection of the British Museum hitherto referred to the Genus *Euploea* of Fabricius."

ROYAL INSTITUTION.—(Saturday, February 23.)

MR. R. BOSWORTH SMITH'S fifth lecture on "Carthage" dealt with the second phase of the Second Punic War. The lecturer began with a brief but forcible summary of Hannibal's wonderful career of triumph, and then traced the history of the duel with Fabius. The battle of Cannae was then described in powerful language. Hannibal had now three times inflicted terrible reverses on the Romans, and each had been a progression on the preceding. Trebia had been a rout; Trasimene, the slaughter of an army; but Cannae was a massacre of two armies of double strength. The panic at Rome was then graphically described, and the question why Hannibal did not at once advance on the capital met by the answer that the step was clearly impossible, simply because the greatest general of all times did not take it; an answer, it is true, savouring somewhat of the *petitio principii*. A high eulogy of Hannibal's conduct throughout the war was pronounced, and the *perfidia plus quam punica* sturdily denied. The extraordinary skill with which, after three years of brilliant aggressive warfare, the Carthaginian general applied his genius to a strictly reserved line of defence was pointed out. The arrival of Hasdrubal, Nero's feint, and its success at the Metaurus, concluded with a peculiarly brutal example of that brutality which ever characterised Roman warfare, brought this phase of the war to its end. The lecture concluded with a sketch of contemporary affairs in Spain and a sarcastic eulogium of the virtues of P. Cornelius Scipio.

FINE ART.

Griechische Thonfiguren aus Tanagra. Von Reinhard Kekulé. (Stuttgart: Spemann, 1878.)

ONE can scarcely call this a book. It is a set of pictures executed with most admirable skill in drawing, in etching, and in colour-printing. But there is a text also, which, like the substance of thought it conveys, is large, simple, and clear. Very rarely indeed does Germany come out in this fashion. Her services to archaeology have been unapproached for their utility. Witness the

Corpus of Latin Inscriptions and the Greek Inscriptions edited by Böckh, now appearing in a second edition, all at the cost of the Berlin Academy, or again the indispensable *Monumenti, Annali, and Bullettino* published by the German Institute of Rome. There is no country which can show anything at all worthy to be set beside this public enterprise on behalf of knowledge of classical antiquity. Nor does German enterprise in this direction end here, as could easily be shown if that were our present business. Our business is rather to call attention to this new field of publication on which the German Institute has entered. For some time it has had in hand a Corpus of Greek Terracottas under the editorship of Prof. Kekulé, of Bonn, of whom it may be said that his work hitherto has made him better known to archaeologists than to the general public, a relative condition of things which the volume of terracottas now issued ought to alter, since the text of it is addressed to all who may wish to learn. Obviously, also, it is the general purpose of education that has been aimed at in confining the selection to figures from Tanagra, which, though perhaps in no case so fine in style as some few that have been found elsewhere, are yet altogether singularly fascinating. Besides, there is something rounded and complete in itself in this discovery of immense numbers of terracottas and little else at Tanagra, a circumstance for which existing records had by no means prepared us.

Since the winter of 1873 several thousands of tombs have been opened. From want of supervision at the beginning, and perhaps in defiance of it since, a considerable number of the terracottas have found their way into museums and into private hands. As a rule, however, there is no such great variety among them that any serious loss to knowledge may be anticipated from this process of scattering. The essentially different types are few, while the number is vast of those which may be described as merely pretty young women corresponding to the China "shepherdesses" of modern ware. It is this that makes them sometimes wearisome when a fairly large series is seen together. The *koroplathos* of Tanagra must have worked for a market where there was less intelligence than what is called taste, and when the wants of private houses were studied rather than the public sense of true beauty. Yet altogether there must have been a certain public pride in these productions to account for so constant a practice as that of burying quantities of them in the tombs, doubtless as acknowledged tokens of respect for the dead. It would be interesting to know whether, like the Athenian *lekythi*, these terracottas were made expressly for sepulchral purposes or were merely ordinary household ornaments swept together from the walls when some important individual of the house died. But on this point it is to be remembered that the *lekythi* are very consistent in representing scenes connected with death, while the terracottas are not. This would be true even if we admitted with M. Heuzey that the class of veiled and draped female figures are to be identified as Demeter and Persephone, for which as yet no adequate reason has been given. On the

contrary, both Kekulé and Rayet subscribe to the view originally proposed by Lüders that the figures in question illustrate the fashions of daily life. Some few may, perhaps, have a symbolic reference to death, but need not on that account have been excluded from use as household ornaments. I had thought (*Gazette Archéologique*, ii., p. 97) that certain female figures in the prime of personal charms playing at the game of Astragali might, like the daughters of Niobe, suggest a sense of the briefness of extraordinary youthful beauty. But M. Heuzey calls this the abyss of symbolism, though one would have thought from the scarcity of arguments in support of his theory that he would have been glad of even so much.

Figures of deities are exceedingly rare among these terracottas. There is Artemis, and there is Eros: at least there is a winged and more or less chubby boy, who is rather one of the crowd of such figures in late art called Erotes than truly the God of Love himself. In one specimen in the British Museum he is playing on a lyre: in another carrying fruits, as if he were a personification of Autumn. Even as regards Artemis it may be questioned whether the figure is really an image of the goddess, though it undoubtedly looks much as if it were. It is argued by Kekulé that the female figures holding masks must be Muses, since they cannot be actresses, women not having been allowed to appear in this capacity. But it is curious, if they are Muses, that no other distinctive attributes are assigned them as in the familiar representations of Muses. A female figure holding an apple or a mirror may be Aphrodite, but, as he points out, it may as well be a person of ordinary life. Then there is Hermes for certain, in the character in which he is known by tradition to have been worshipped at Tanagra—Kriophoros. Still, as has been said, these types are few compared with the many which have no identity, being either merely pretty women, girls, and boys, or groups from daily occupations—as, for instance, a barber plying his trade; a kitchen scene; or a very aged nurse with an infant in her lap. As regards the merely pretty figures, Prof. Kekulé has collected evidence to show that there was no lack of models for them in Thebes at least, and probably also in Tanagra itself. The peculiarities of costume answer to the ancient descriptions, and in some cases have survived to modern times. The hair is always a reddish-brown, and the eyes nearly always blue.

The date assigned to the mass of these terracottas is the third century and end of the fourth B.C., and it is supposed that their style was largely influenced by the Theban-Attic school of painting then flourishing. Tanagra was near enough to Athens to have profited by impulse from her artistic activity. Yet it is curious how little of the individuality of Athenian types it has yielded. Of very archaic figures with scarcely any indication of bodily form, and decorated with painted geometric patterns, a small number have been discovered, apparently, from what records have been kept, in the deepest tombs. But between these and the others there seems to be no evidence of transition or development.

When compared with the collection in the British Museum, the specimens now published stand out in some cases as having preserved their original colours with extraordinary freshness, and no doubt it was on this account that they were chosen. The difference is only one of comparative good fortune which any day may do away with, and under no circumstances would we question the absolute accuracy of the reproductions in this respect. Towards this end neither skill nor means were wanting, and the result is an achievement in the way of publication which has no rival.

A. S. MURRAY.

MICHELANGELO'S CARTOON OF PISA.

AN important contribution to our knowledge of Michelangelo's "Cartoon of Pisa," as his composition of soldiers surprised while bathing in the Arno is usually called, is made by Prof. Moritz Thausing in the *Zeitschrift für bildende Kunst* this month. It has generally been believed that of this great work of Michelangelo's, which, as everyone knows, was destroyed at an early date after its execution, the world possessed a tolerably accurate, though not perhaps a very masterly, copy, in the grisaille painting in the possession of the Earl of Leicester at Holkham. This is the composition which Schiavonetti engraved in 1808, and which has since become so well known by reproductions in almost every text-book of art. But doubts have before now been thrown by critics on its authenticity, and its origin has never been distinctly traced. It can scarcely be the copy Vasari speaks of as having been made at his desire by Bastiano da San Gallo in 1542, though that also was executed in black-and-white. This copy according to Vasari, was presented by a prelate named Giovio to Francis I., and passed into France; whereas the Holkham copy, which was derived from the Barberini Palace, is not supposed to have left Italy until it passed into the possession of the Earl of Leicester.

Passavant and Waagen both suppose that the grisaille at Holkham is a copy, not from Michelangelo direct, but from Bastiano's work—a copy of a copy. Prof. Thausing goes farther than this, and seeks to prove that the highly-esteemed Holkham composition is in reality nothing more than what is termed a *pasticcio*, or a work made up from various sources, the principal being the engravings of Marcantonio's school, which offer us fragments of Michelangelo's work, and Vasari's graphic description.

The evidence for this view Prof. Thausing finds chiefly on the original design which, as before stated in the *ACADEMY* (Oct. 13, 1877), he has had the good luck to acquire for the Albertina collection. A photographic facsimile of this roughly-outlined pen-drawing is given in the *Zeitschrift*. It differs materially from the Holkham composition, both in the arrangement and number of the figures, the Holkham painting containing nineteen, while the original sketch only gives fourteen, some of them in quite different positions.

This proves nothing, however; for Michelangelo probably made numerous sketches for this work before fixing on the design which he ultimately adopted, and one might well expect to find variations in them. It is a significant circumstance, however, that in the Holkham example several of the figures are in a reverse position to those indicated in the drawing, and especially that the man on the left of the picture who leans over the edge of the bank in order to reach something out of the water does so with his left hand, exactly as he does in Marcantonio's engraving of the three figures known as the *Climbers*, which is known to have been reversed. This is, of course, suspicious, and offers a strong point in favour of Prof. Thausing's view, but it

seems scarcely safe to argue from the very rough original sketch here reproduced, which evidently is nothing more than the artist's hasty jotting-down of some passing idea, or first conception of the subject, as to the form which that conception finally took. We cannot help thinking also that Prof. Thausing has drawn somewhat on his own imagination in the composition he constructs in outline from Michelangelo's sketch and compares with the Holkham example. There seems to be no doubt as to the originality of the sketch in the Albertina, and it affords most valuable data for the study of this subject, though it cannot be accepted as conclusive. Beside the cartoon composition, the figures in which are unmistakable, though, as before said, many are merely indicated, there is on one corner of the paper a rough sketch of an arched window or doorway, over and at the side of which are seen two very small sketches of pictures set in frames, with the names *S. Giorgio* and *S. Giovanni* written upon them in Michelangelo's pointed handwriting. Without these names, however, one can distinctly make out the subjects of these queer little pen-scratchings. Whether they were the first dawnings of any great conception it is impossible to say. Such pictures are not known to have ever been painted by him.

Prof. Thausing does not in his clear history of the competition between Lionardo and Michelangelo enter into the reason as to why the latter did not paint his composition on the wall of the Palazzo Vecchio, like his rival. This has never been satisfactorily explained. M. M. HEATON.

THE ART OF PREHISTORIC GREECE.

A NEW chapter in the history of art and early Greece has been opened up by the recent discoveries and explorations in that country. The contents of the graves of Spata, near Athens, have been brought to light just in time to compare them with the treasures of Mykenae; and the two collections can now be studied side by side in the new Museum at Athens. It will be long before all the problems connected with these discoveries can be satisfactorily solved, or the various conclusions suggested by them fully followed out; each worker, in his own sphere, will have enough to occupy him for several years to come. Leaving to others more competent than myself to discuss and determine the leading questions called up by these interesting discoveries, I now send a few notes made during my recent visits to Olympia, Mykenae, Orchomenus, Spata, and Athens. One fact at all events is clear, and that is the profound influence exercised by the East, and more especially by Assyria through the medium of the Phoenicians, upon the civilisation of early Greece. Each fresh discovery made only serves to impress this fact more strongly upon the mind.

Firstly, then, as to the date of the objects found by Dr. Schliemann at Mykenae. On this point I think it is possible to throw a little fresh light. There is among them an interesting signet-ring of gold—discovered in a grave according to Dr. Schliemann, in a house according to M. Stamatakis—which represents the figure, perhaps of a woman, seated under a tree, with a second figure behind, and three others in front. The first of these is smaller than the rest, and is in the act of adoration; the other two wear the flounced dress characteristic of the primitive Babylonian priests, and above them are the common Babylonian symbols of the sun and crescent. The figures, as well as their position and the mode in which they are drawn, are an exact reproduction of what we find on the Babylonian gems of the early epoch, and must, as it seems to me, belong to the same period. The period, at all events so far as its influence upon foreign art was concerned, may be said to close with the rise of Assyria in the thirteenth century B.C. Here, therefore, we have a limit of age for some, at least, of the Mykenean antiquities. This signet-ring, however, is the

most primitive in style of all the engraved gold objects that have been found, whether chatons or prisms; and these, by the way, illustrate in a very interesting manner the development of the engraver's art in ancient Mykenae. Thus we have among them the representation of a hunt which is Assyrian, and no longer Babylonian, in character; next that of a lion which is equally Assyrian; then that of a struggle between a hero (? Herakles) and a lion, where, though the animal is still Assyrian and the attitude that of the Chaldean hero, Giedhubar, in his struggle with the lion, the male figure more nearly approaches the Greek type; and, lastly, a battle-scene, in which the art is no longer Oriental, but has become Western. It is plain that these seals and prisms, though found in the same spot, mark successive periods of artistic progress and skill. I may add that another relic of what may be termed the Babylonian period of Mykenae art seems to have survived on a fragment of ivory (or wood), marked μ 649, where a flounced dress is apparently depicted. The double horn, too, which ornaments the helmets of the warriors on a fragment of painted pottery reminds us somewhat of the two horns that adorn the head-dress of the upper classes on archaic Babylonian gems. It is noticeable that none of these warriors wear the plaid dress with fringes represented on several pieces of Egyptian porcelain: the dress in question is very Assyrian in character.

The remains from the rock-tombs of Spata supplement those from Mykenae, and furnish patterns identical with those from the latter place. Thus the murex, that sure symbol of the Phoenicians, appears in both; indeed, this and one or two other patterns from Spata exactly fit those drawn on stone moulds from Mykenae. It is especially with the contents of the sixth tomb, discovered by M. Stamatakis at Mykenae after Dr. Schliemann's departure, that the objects from Spata harmonise so closely. The ivories from Spata are particularly important, as bearing upon the date and origin of the remains with which they were found. They are unmistakably Phoenician in workmanship, and exhibit that mixture of Assyrian and Egyptian art so characteristic of Phoenicia. Thus the sphinxes represented on them, though Egyptian in origin, are modified by Phoenician, or rather Assyrian, influence; and the rosette, upon which the sphinxes have their eyes fixed in one instance, comes primarily from Babylon. The model of a small column, too, bears upon it the stamp of Assyria, while the head of a man with a quadruple tiara seems to show that Assyrian influence entered Greece through Asia Minor as well as through Phoenicia. The head and tiara resemble those found in a bas-relief at Ibreez (Lycaonia) by Mr. Davis (*Transact. of Soc. of Biblical Archaeology*, iv., 2, p. 336), accompanied by inscriptions in the so-called Hamathite characters, and belonging to that modification of Assyrian art which we may now venture to term Hittite. A similar head-dress appears in the third line of the inscription found on the back of a broken statue by Mr. George Smith at Jerablús (Carchemish). A visit to Spata convinced me that other rock-tombs exist in the neighbourhood; and, considering the value and interest of those already opened, it is to be hoped that the Archaeological Society of Athens will soon find an opportunity of exploring them.

As was to be expected, no traces of direct Egyptian influence are to be met with among the remains from either Mykenae or Spata. An ostrich's egg, however, adorned with stucco dolphins, and the fragment of another, point to an intercourse between Mykenae and the Phoenicians of the Delta—indeed, ostrich-eggs have already been found intermingled with objects of Phoenico-Greek art in the Polledrara grotto near Vulci—and I noticed the *crux ansata* on a piece of pottery, though, as this was only a fragment, the appearance may have been deceptive. The gold masks, too, found on some of the bodies

remind us of Egypt; a gold mask of similar character, for instance, belonging to Prince Kha-em-Uas, was discovered in an Apis-chamber and is now in the Louvre. However, a small gold mask was found a few months ago in a grave at Aradus.

Among the gold ornaments from Mykenae are some which represent the sitting figure of a goddess. This resembles the sitting figures of terra-cotta from Tanagra, which in form and material belong to the prehistoric period, and are merely variant forms of the same goddess, apparently the Babylonian Nana, who appears upright, with the head crowned and the arms either crossed or extended, both at Tanagra and Mykenae. Images of this goddess, called "idols" by Dr. Schliemann, have been found on other prehistoric sites, and M. Fr. Lenormant has traced them from Babylonia to Greece (see *Gazette Archéologique*, ii., 1 and 3).

With all this evidence of intercourse with the East, and more especially with the Phoenicians, it may seem strange that nothing like writing has been met with. I can only suggest by way of explanation that the Phoenicians themselves, or at least the Phoenicians of Palestine, were not yet acquainted with their alphabet. In this case we should be referred to a period earlier than that of Hiram, the contemporary of Solomon, when Phoenicia already possessed a literature. It is possible that when Orchomenus comes to be excavated, as is the intention of the Archaeological Society of Athens, inscriptions may be discovered there in the Phoenician character. Greek tradition ascribed the introduction of the alphabet to the Phoenician colony at Thebes, and the Kadmeians of Thebes were closely connected with the Minyans of Orchomenus. What I saw at Mykenae convinced me that the tombs found by Dr. Schliemann are much older than the so-called Treasuries outside the walls; and it is to the age of the Treasuries rather than to that of the tombs that I believe the remains yet to be unearthed at Orchomenus will turn out to belong. The prehistoric age of Greece, in fact, which is being revealed to us by the explorations at Rhodes, Cyprus, Hissarlik, Mykenae and elsewhere, was of very long duration, its most primitive features being probably represented by the objects found by Dr. Schliemann at Hissarlik. On the other side it lasted down into the historical age of Greece; for though Hellenic art, whether archaic or classical, must be kept quite distinct from that of the prehistoric period, it has much in common with the latter, especially in the matter of geometrical patterns, while specimens of Phoenician art of comparatively recent date have been met with all over Greece. Thus at Olympia I was shown a bronze plate, which Dr. Weil thinks may have formed part of a candelabrum, and is at any rate decidedly Assyrian in character. It is divided into four compartments, the uppermost representing the species of nondescript birds common on the so-called Corinthian vases; the second, Assyrian monsters; the third, the combat of Herakles with the Kentaure, altogether Assyrian in type; and the fourth, the Asiatic goddess with a lion in either hand and four wings behind. The same figure in exactly the same attitude may be seen upon some small square gold plates presented by M. de Saulcy to the Louvre. At Athens, again, M. Koumanoudes put into my hands a bronze dish, also from Olympia, adorned with Phoenician embossed work in the Egyptian style, and bearing a beautifully-cut inscription in Phoenician characters on the back, an inaccurate copy of which had been sent to M. Clermont-Ganneau. I read, "Belonging to Neger the son of Miga." The inscription is interesting in more ways than one. In the first place, the word signifying "son" is the Aramaic *bar*, and not the Phoenician *ben*, showing that the owner must have been of Aramean descent. In the second place, the characters are those of the Aramean branch of the Phoenician alphabet, and the dish may be dated, I think, B.C. 600-500. The

date is of some importance, since the characters belong to the same age as those of the inscription on the famous silver cup found the year before last at Paestrina.

Prof. Rhousopoulos also showed me several gems in his collection, found in different parts of Greece, but of decidedly Phoenician origin. One of them bears a Phoenician inscription in Sidonian characters of the seventh century B.C., which I read 𐤍𐤏𐤋𐤍 , "belonging to the brother of Menes (?)." It represents a standing figure in Assyrian costume, with a spear in the hand and a crescent overhead. Prof. Rhousopoulos further showed me a Babylonian cylinder, which I may perhaps be allowed to notice here, as it will interest Assyrian scholars, even though it has little to do with the history of Greek art. The cylinder represents a king seated on his throne in archaic dress, with his subjects in front. It has an inscription in three lines, the last containing the name of the city of Agane, the seat of one of the most famous libraries of ancient Chaldea. I am not quite sure of the correctness of my copy of the first two lines, which were copied hastily, but they seem to read "Menä, servant of Khamuragas." If this is right the cylinder would be an evidence of the occupation of Agane by the Cassite conqueror, Khammuragas.

The amount of gold already discovered at Mykenae is certainly astonishing, and I was not prepared to find it was so large. Gold objects have been found in Greek graves of all ages, but never before on anything like so large a scale. In a book of *Travels in Sicily, Greece, and Albania*, however, published by Mr. Hughes in 1820, the author describes the number, weight, and workmanship of various gold objects found a few years before by Mr. Lee, in a tomb on Mount Aëto, in Ithaca, in terms which would be quite applicable to such a treasure as that of Mykenae. After all, the title of "Treasury" given to the prehistoric tombs at Mykenae and Orchomenus is not so far wrong, since the objects buried with the dead fully justify the name. But I do not think the long and elaborate approaches to these treasures were subterranean passages by which access was allowed to their contents; similar passages exist at Spata, and there a personal inspection satisfied me that they had been filled up with earth as soon as the bodies of the dead and the objects buried with them had been deposited in the graves.

A. H. SAYCE.

P.S.—I entirely agree with the view expressed by Prof. Mahaffy in *Macmillan's Magazine*, that the *enceinte* within which the tombs were found at Mykenae is *not* an agora. I doubt even whether it has ever been used for such a purpose, were it on no other grounds than the smallness of the circle or the fact that it lies within the Acropolis. However this may be, it must have been originally erected in connexion with the tombs beneath. The stones of which it is composed are sandstone-grit, from the same quarries on the Treton road, midway between Mykenae and Nemea, as the tombstones and the stones found in the graves themselves, and thus differ entirely from the conglomerate stones of the treasuries and walls, or the grey Messenian limestone on which the lions are carved. Moreover, one side of the sixth tomb found by M. Stamatakis, after Dr. Schliemann's departure, is immediately under the inner row of the stones of the *enceinte*, and the six tombs are arranged in two rows in the western half of the *enceinte* in artificial ground raised to the level of the natural rock, which rises almost to the surface in its eastern half. The *enceinte* just enclosed these tombs and nothing more. The enclosure was surely intended for sacrifices or offerings to the dead, and ashes were found by Dr. Schliemann in the soil. The stones of the *enceinte* slope inwards on the eastern side simply because of the weight of the earth behind them, just as they slope outwards for the same reason on the western side; and, so far as I could see, they do not slope in any

direction at all on the south or north. The mortices in the stones forming the *encante* certainly seem to imply that horizontal blocks were once laid across them, but it must be remembered that such horizontal blocks have not been found *in situ*, except in a still unexcavated corner on the east side.

ART SALES.

THE oil pictures which had been in the collection of Mr. Jupp were sold last Saturday at Messrs. Christie, Manson and Woods'. They included fair examples of Patrick Neamyth—one of which sold for 215 guineas—J. Linnell, E. Verboeckhoven, and other artists. In a different property were sold, *A River Scene*, with bridge and boats, by Peter de Wint, 30 gs.; *Penmaenmawr*, a late and large sketch of David Cox, on the large-grained rough paper that he used so much in his later years (43 gs.); *Barmouth Sands*, a sketch assigned to Turner, and presumably of the late period of his work—an "arrangement," to adopt the fashion of the moment, in red, orange, and blue. A reddish sketch, exceedingly slight and broad, and very effective—one of the unfinished pieces of Frederick Walker—was offered. It represented or suggested the interior of a studio, with an easel and an artist at work thereon, and, at a little distance, a model standing—a girl in act to beat a drum. The lighting was very true and effective. The sketch was knocked down at 30 gs. Some sketches by the late T. Creswick, R.A.—a very happy little one of *The Ford*, in sepia, and others in colours, of which some were sufficiently favourable examples of his work—occurred later in the sale.

Messrs. SOTHEY, WILKINSON AND HODGE were to commence yesterday the disposal of the very large collection of prints and drawings long, we believe, in the possession of Mr. William Sharp, of Manchester. This is one of those sales of which one or two occur in the season: remarkable, it may be, in some parts of it, for the quality of the works offered, but first, at all events, claiming attention by reason of quantity. In mere quantity, however, the Sharp sale is less formidable than the James sale of last year.

NOTES ON ART AND ARCHAEOLOGY.

WE very much regret to hear that Prof. Ruskin is dangerously ill from over-work. He is at his house at Coniston.

A VOLUME of photographs of eighteen "Imp" drawings, with descriptions of the imps, is about to be published by Mr. Wheeler, of Oxford. The author is the Hon. Mrs. Cradock. Both drawings and descriptions are full of a curious, weird talent, reminding us somewhat of that of Richard Doyle. We shall be surprised if the little volume does not meet with considerable success among children young and old.

ON Thursday evening, March 7, a paper will be read before the Society for the Encouragement of the Fine Arts, at their rooms, 9 Conduit Street, Regent Street, by Mr. Robert W. Edis, F.S.A., on "The Decoration of Town Houses." The chair will be taken at eight o'clock by Mr. Edmund Yates.

THE Artists' and Amateurs' Society had their *conversations* on Tuesday evening, at the Rooms of the Society of Painters in Water-Colour, when there was a goodly company, and many works of interest exhibited. Among the works of deceased artists that drew special attention may be mentioned an important picture by John F. Lewis—*An Eastern Courtyard*—and a series of designs by David Cox. Among the works of living artists a pleasant river-landscape by Aumonier was exhibited; several pictures by Henry Moore; an exquisite figure subject by Albert Moore; and two or three of the large broad water-colour drawings

of Venice, which have justly earned for Miss Clara Montalba her fame as in the best sense a masculine artist. Miss Montalba's works—whether those seen on Tuesday evening or those exhibited previously—are in a style from which many of the younger water-colour painters, her contemporaries, would do well to learn. She brings back to water-colour art, in the opinion of many, a freshness and a strength it has not known since Cox and De Wint.

WE hear that the little Turner Exhibition which will open in New Bond Street in a day or two will contain, in addition to Mr. Ruskin's Turner drawings, a representative selection from the *Liber Studiorum*, which, though necessarily far less complete and imposing than the unequalled Exhibition of Turner's greatest engraved work, held about five years since by the Burlington Fine Arts Club, may still be seen with interest and advantage by those who missed that greater exhibition.

THE death of the celebrated landscape-painter Charles François Daubigny was briefly chronicled last week. His malady was hypertrophy of the heart, and had taken a manifestly fatal turn for about three weeks prior to his decease. He was born in 1817, without any advantages of fortune, and was, as far back as 1832, a painter of boxes, clock-cases, &c. By 1840 he had fully started on his career as a landscapist, noticeable for strong naturalism. Among his early works are the *Bords de la Rivière d'Oullins*, the *Seine at Charenton*, and the *Iles de Bezons*. One of his most renowned productions is now in the Luxembourg gallery, *L'Ecluse de la Vallée d'Oplevoz*, 1855. In the exhibition of last year, a *Moonrise* excited and deserved great admiration. River-scenes, with long and luminous vistas, were among his subjects of predilection. He was powerful, skilled, free from affectation in purpose, and from unrepaying over-labour; direct, impressive, sometimes startling in the truth of his scenes, and in the sentiment arising immediately out of that very truth. He and his son (Karl Daubigny, also a landscape-painter of well-earned repute) had a kind of floating studio, a barge, often of late years to be encountered on the Seine or the Oise; they painted as they drifted along, or, landing from time to time, made excursions after the picturesque.

UNDER the name of the Kyrle Society an association of ladies and gentlemen has lately been formed for the purpose of "bringing the refining and cheering influences of natural and artistic beauty into the homes and neighbourhood of the poor." These influences are undoubtedly felt to a greater extent than formerly among the middle-classes of society, and it is a pleasant and unselfish aim to wish to extend their effects as far as possible, so that the taste for beautiful things shall become still wider spread. We therefore sympathise entirely with the Kyrle Society in its endeavour—"1. To decorate with mural and other paintings, carved brackets, &c., rooms used by the poor for social purposes, such as clubs, school-rooms, and mission-rooms. 2. To make gifts of pictures and flowers for the homes of the poor. 3. To lay out as gardens any available strips of waste ground, and to encourage the cultivation of plants. 4. To organise choirs of volunteer singers. 5. To co-operate as far as possible with the Commons' Preservation Society in securing open-air spaces in poor neighbourhoods to be laid out as public gardens; and, 6. To further any effort at abating the smoke nuisance in manufacturing districts." Anyone who deems these objects praiseworthy may become a member of this society without subscription, but personal aid in all its undertakings is greatly valued.

M. DE NITTIS is exhibiting at the Cercle Artistique another of his curiously-detailed views of our London streets. This time it is the great thoroughfare in front of the Bank of England that he has represented, alive with what a French critic calls "the ferocious coming and going of the City." A foggy atmosphere prevails; but the

French will hardly accept M. de Nittis as a true exponent of a London fog, for everything looks tolerably bright and distinct in spite of the weather, while the prevailing notion abroad is that all colour and beauty is at once blotted out by it. A fog, however, may often lend a picturesque aspect to an ugly subject; and this, we imagine, is the aspect which M. de Nittis has chosen for his representation of the certainly unpicturesque Bank of England. Few artists besides himself would have attempted to make a picture out of such very unpromising materials.

BESIDE Prof. Thausing's article on Michelangelo's cartoon mentioned elsewhere, the *Zeitschrift für bildende Kunst* throws doubt this month on another English treasure—namely, the beautiful *Cupid* by Michelangelo in the South Kensington Museum. In a short note by Herr Michaelis it is pointed out that Aldrovandi, who wrote a catalogue of the antiques in Rome in 1550, mentions among them the *Bacchus* and, as he calls it, the *Apollo*, which Michelangelo executed for Paolo Gallo, and describes the *Apollo*, which doubtless was the same as the *Cupid* mentioned by Vasari and Condivi, in terms which do not apply to the South Kensington statue. This, it must be owned, is unsatisfactory, as that work is generally supposed to have been identified with the one executed as a commission from Signor Paolo Gallo. The other articles of the number are by Jacob von Falke on the metal-work and jewellery of the East, the second article of a series, and by the editor (von Lutzow) on the treasures of the newly-built museum of the Vienna Academy, which was opened a few weeks ago to the public.

KAULBACH's two great cartoons of *Wilhelm Tell* and *Romeo and Juliet* have been engraved, the one by E. Martin and the other by Leeman, for the "Gesellschaft für vervielfältigende Kunst." Palma Vecchio's celebrated beauty, the *Violante* of the Vienna Gallery, has also been engraved for this society by J. Burger. The *Violante* of the Belvedere is, perhaps, the most lovely of all the many beautiful female portraits ascribed to Palma.

THE STAGE.

MR. GILBERT'S NEW PLAY.

MR. GILBERT's *Ne'er-do-Well*, produced at the Olympic Theatre on Monday evening, has unfortunately only furnished another evidence of the difficulty under which our managers labour of obtaining new pieces possessing the elements of popularity. This is a play in three acts, partaking more of the character of a romantic drama than of a comedy. In other words, its aim is, in the first place, to interest us in a story; but the story is unhappily the weakest feature of the work. The original notion of the author seems to have been to portray a worthy hero who has sunk into idle and dissipated habits only through a disappointment in a love affair; to show him suddenly raised from his fallen condition by the kindness of an old schoolfellow; then tempted to forget the obligations of gratitude and friendship, on discovering that his benefactor is in love with the very lady who has been the innocent cause of the *Ne'er-do-Well*'s temporary downfall. The conflict between overwhelming passion and the voice of duty and honour is always a promising theme for dramatic treatment; and Mr. Gilbert has been careful to exhibit his hero as recovering from a momentary outburst of his old feeling, and resolving heroically to sacrifice himself for the sake of his benefactor. Nor is the force of this generous resolve necessarily weakened by the ultimate discovery that it is not needed, because the benefactor in his heart has so decided a preference for a pretty village girl, with whose affections he has cruelly trifled, that he marries her and leaves his friend to espouse the original object of his affection. All this only

provides the "happy ending" which our audiences are accustomed to expect in a romantic play. But the truth is that the theme is pursued without any effort to give full strength to the contrasts and antagonisms which it involves. It is obvious that in contemplating the rivalry between the benefactor and the *protégé* the pathos of the situation must greatly depend upon the spectator's previously acquired sympathy with each party. It is only the worthy man whose trials and struggles with adverse circumstances constitute a spectacle pleasing to gods and men. But the author has, with fatal perverseness, contrived to deprive each of his two heroes of almost every claim to respect. The benefactor, though he has rendered a slight service to an old schoolfellow in trouble, is a selfish, fickle, and unprincipled person; and the reformed Ne'er-do-weel is so weak a creature that when he finally obtains the hand of the heroine it is impossible not to feel that the young lady deserved to draw a less doubtful prize in the matrimonial lottery. It may be that a timely lift on the road of life must be paid for, as folks say, "in meal or in malt," but the meal should clearly be the payer's own meal, and the malt ought not to be abstracted from anybody else's store. Mr. Gilbert's Ne'er-do-weel not only subjects the object of his love to the painful embarrassment of being wooed by an old admirer on behalf of a distasteful rival, but actually proposes to sacrifice her to a man who is well known to be plotting with his embarrassed father to apply her fortune to their own purposes. The author does not seem to have felt that his hero, by generously taking upon himself the discredit of his friend's heartless flirtations with the village maiden, was really tacitly entering into a conspiracy against another young lady's peace and happiness. As he well knew, the lady really preferred the reformed scapegrace, who, as we are to believe, would never have been a scapegrace but for the magic of her bright eyes and the cruel opposition of unsympathising guardians. Why, then, should she be subjected to the shock of hearing from her lover's own lips a false confession of treachery towards herself and of heartless behaviour towards a poor girl? And why should a pleasing and accomplished young lady, with a fortune to boot, be tempted by a fraud to hand herself over for life to the wrong man? Mr. Gilbert's only answer must be that this is his hero's notion of how to repay one who, having found him without employment and in rage, has furnished him with a suit of clothes and a snug situation.

Unfortunately good acting is not only powerless to redeem defects of this kind, but serves to deepen the impression of inconsistency and lack of truth. The more pleasing, for example, is the village maiden in the person of Miss Gerard, the more contemptible appears Mr. Seton, the young gentleman who, having trifled with her affections, addresses her with offensive familiarity and coxcombical compassion, and, heedless of her suppressed sobs, even enters upon a description of his feelings towards her wealthy rival. In like manner the innocent graces and tender impassioned utterances of Miss Marion Terry as the wealthy young lady referred to, only bring into stronger relief the meanness and the weakness of her two lovers. Mr. Henry Neville is an excellent representative of heroes of the Ne'er-do-weel class—men who have fallen away from the path of honour under evil influences, but have still enough of good feeling and generous impulses left to work out their own redemption; but acted in this spirit the character is necessarily felt to be at variance with itself.

These objections would probably be sufficient in themselves to explain the somewhat unfriendly reception accorded to *The Ne'er-do-weel* on its first performance, but they are far from exhausting the defects of the play. Mr. Gilbert has attempted in the manner of M. Sardou to relieve the sentiment of his story by the introduction of scenes which belong rather to extravagant vaudeville

than to romantic drama; but the relief is less apparent than the air of incongruity which these elements impart to the work. This arises no doubt in great measure from the circumstance that the scenes referred to are of an episodic and arbitrary kind; or are protracted and elaborated in a degree out of all proportion to any influence that they have on the action of the play. There is an amusing trait of character in the elder Mr. Seton's propensity to self-depreciation, with its accompanying habit of resenting anything like acquiescence on the part of others in his own modest utterances. An old retired sea-captain, represented by Mr. Anson with too much noise and violence of manner, is also a clever character-sketch. The first attempt of this gentleman to perform the duties of Justice of the Peace, to which office he has just been appointed by a good-natured Lord-Lieutenant, is in itself a humorous conception, though the worthy captain's shake of the hands and his friendly "How are you, Dick?" in spite of the circumstance that he well knows the prisoner to be a dishonest and disreputable fellow, and quite capable of the burglary with which he is charged, are too absurd even for caricature. The audience, however, were not in the mood to do justice to the humours of a scene so far out of the direct line of the story and so little in harmony with its spirit.

MOY THOMAS.

THE publication a few years ago of a new Life of Edmund Kean has led to the revival of some of the forgotten plays which he made so popular. A correspondent tells us of a recent performance in Yorkshire (by a company under the management of Mr. James Scott) of George Coleman's *Iron Chest*. It was arranged for the stage and the chief character was creditably performed by a young actor passing under the name of Poel, the son, we understand, of a well-known scientific man in London.

MUSIC.

LAST Saturday afternoon Herr Ignaz Brüll made his first appearance at the Crystal Palace. Well known in Germany both as a composer and pianist, Herr Brüll came forward on this occasion in both capacities, selecting for performance his own second concerto in C major. Judging from this work, we should class the composer among the musical conservatives, rather than as belonging to the "New German School." A work clearer and more symmetrical in its whole form and design Mozart himself could hardly have written. There is no attempt at profundity, no over-elaboration, but a perfect artistic balance in the whole. The opening themes of the first Allegro are slightly commonplace; but Herr Brüll is not the first who has shown how much can be done with apparently unpromising material. The Andante and Finale are happier in invention; the subjects of these movements are very pleasing, though individuality of style is hardly the composer's strong point. He excels most in the admirable workmanship and perfect finish of his music; it is not especially striking, but always good, and one recognises in it the hand of the genuine artist. Herr Brüll's playing has much affinity with his style of composition; he does not dazzle, like Rubinstein and others who might be named, but he always satisfies; in a word, it is good sterling playing; and the opinion formed after hearing him at the Monday Popular Concerts was confirmed on Saturday, that in Herr Brüll we have not a phenomenal player, but a genuine and conscientious artist. Wagner's "Eine Faust-Overture," which opened the concert, had been only once previously heard at the Crystal Palace (October 10, 1874), and was well worth repeating. There is little to add to what was said in these columns on the occasion of its first performance. It is a thoughtful and poetical work, but one which, both from the nature of its ideas and from its

musical treatment, will be always more interesting to musicians than to the general public. Whether it will ever become a favourite piece with our audiences may be gravely doubted. In spite of its great difficulty, it was magnificently played under Mr. Manns' direction; but it was coolly received—a result which can have surprised nobody who was acquainted with the music. The other orchestral pieces at this concert were Mozart's lovely Symphony in E flat, and Bennett's Overture to the *May Queen*. The vocalists were Herr Henschel, one of the first living baritones, and Miss Merivale, a *débutante* with a small but pleasing voice, as to whose musical acquirements judgment must be reserved till she is heard under more favourable circumstances. It is seldom possible to form a just opinion of a young singer on her first appearance.

ON Tuesday evening Mr. Henry Leslie's Choir gave their first subscription concert for the present season at St. James's Hall. This admirable choir has now entered upon the twenty-third year of its existence, and in the performance of unaccompanied music, which from the first has been its specialty, it still retains its pre-eminence. Any more finished singing than that of Bach's very difficult eight-part motett "The Spirit also helpeth us," could not be desired. Other noteworthy features of the programme were a motett, "Gaudent in coelis" for double choir, by Walliser, and the "Pater noster" of Meyerbeer. English composers were represented with madrigals and part-songs by Alfred R. Gaul, Charles Lucas, Hubert S. Parry, J. F. Barnett, and Henry Smart; while the choral music was relieved by solo pieces given by the Misses Robertson and Mr. W. G. Forington, the latter a very young baritone singer, with a voice of pure and excellent quality, who made a most successful first appearance. With careful study he ought to take a good position in the profession.

AT the Adelphi on Monday, Mr. Carl Rosa gave, for the first time this season, Benedict's *Lily of Killarney*, the performance of which formed one of the important features of his last season at the Lyceum. The part of Danny Mann, previously taken by Mr. Santley, was well given by Mr. Ludwig; the other chief characters, Eily, Hardress, and Miles-na-Ooppaleen, being sustained, as before, by Miss Julia Gaylord, Mr. F. C. Packard, and Mr. Charles Lyall. The performance was characterised by the same finish of ensemble as that of the *Merry Wives of Windsor*, already mentioned in our columns. During the week these two operas have been played alternately. For this evening the production of Brüll's *Golden Cross* (for the first time in England) is announced.

ON Wednesday afternoon Mr. Oscar Beringer gave at St. James's Hall what was announced as a "Piano Recital," but was in reality a chamber concert, with a very interesting programme. The first piece was Brahms's trio in E flat for the unusual combination of piano, violin and horn, in which Mr. Beringer was assisted by Messrs. Holländer and Wendland; and the finale was Hummel's well-known septett in D minor, in which the three gentlemen just named were joined by Messrs. Svendsen, Dubrucq, Daubert, and Pavgatsky. As his solos Mr. Beringer chose the second of Bach's "Suites Anglaises," the "Sonata Appassionata" of Beethoven, and smaller pieces by Chopin, Schubert, Schumann, and Raff. The vocalist was Mdlle. Redeker, who gave songs by Schubert, Schumann, and Jensen. Mr. Beringer's sterling playing is too well known to need eulogium here; it will suffice to say that his performance on this occasion fully sustained his reputation. The concert was in all respects most enjoyable.

THE first of Herr Franke's fifth series of Chamber Concerts was given at the Royal Academy of Music on Tuesday evening. The chief works in the programme were Goldmark's Suite in E, for

piano and violin, played by Herr Ignaz Brüll and Herr Franke, Wieniawski's "Légende" for violin, and Beethoven's quartett in C minor.

A CONTRIVANCE for sustaining the sounds on the pianoforte, without interfering with the usual form or structure of the instrument, has been invented by Luigi Caldera of Turin, and recently patented by Messrs. Kirkman and Son, of London. The mechanism consists of a simple and ingenious arrangement of small hammers, attached to a cylinder which is set in motion by a pedal. During the rotation of the cylinder a continuous vibration of the strings is produced.

LOUIS PAPIER, organist of the Thomaskirche at Leipzig, and well known in Germany as an excellent player, died in Leipzig on the 13th ult., at the age of 49.

MESSRS. SCHOTT AND CO., of Mainz and London, have recently published two very interesting works by Richard Wagner—a so-called "Album-Sonata" for piano, and the *Siegfried-Idyll*, for a small orchestra. The former, written, as we learn from the title-page, in 1853, for a lady's album, is a rhapsody, or fantasia, rather than a sonata, as that word is commonly understood. It is in the form of a long slow-movement, with an episode in the middle in quicker tempo; both in melody and harmony it is highly interesting, and it is by no means very difficult to play. The *Siegfried-Idyll* was composed in 1871—the time of the completion of the score of *Siegfried*—for M^{rs}. Wagner's birthday, and was not originally intended for publication. The work is scored for a (for Wagner) remarkably small orchestra; besides the strings there are only one flute, one oboe, two clarinets, one bassoon, two horns, and one trumpet; and Wagner has probably never shown more strikingly his mastery of instrumentation than by the charming effects he obtains with so few instruments. The work is a Pastoral founded on themes mostly taken from the great duet between Siegfried and Brünnhilde; and, though hearers who are unacquainted with the drama would miss the additional interest inspired by the association of ideas, the music is of such intrinsic beauty that it could hardly fail to produce a great effect. Mr. Manns might well introduce it in one of the Crystal Palace programmes.

CHATTO & WINDUS, PUBLISHERS.

2 vols. 8vo, cloth extra, with Illustrations by Arthur Hopkins, 21s.

A SECOND EDITION OF

MISS MISANTHROPE. By Justin

MCCARTHY, Author of "Dear Lady Diddan," &c.
"In 'Miss Misanthrope' Mr. McCarthy has added a new and delightful portrait to his gallery of English women. It is a study of character emphatically modern. It is a novel which may be sipped like choice wine; it is one to linger over and ponder; to be enjoyed like fine sweet air or good company, for it is pervaded by a perfume of honesty and humour, of high feeling, of kindly, penetrating humour, of good sense, and wide knowledge of the world, of a mind richly cultivated and amply stored. There is scarcely a page in these volumes in which we do not find some fine remark or felicitous reflection of piercing yet gentle and indulgent irony."—*Daily News*.

Now ready, 2 vols. 8vo, cloth extra, with Illustrations, 21s.

A SECOND EDITION OF

THE WORLD WELL LOST. By

E. LYNN LINTON, Author of "Patricia Kemball," &c.
"The 'World Well Lost' exemplifies all Mrs. Linton's admirable merits and rare powers. It is superlative to say that the book is written in Mrs. Linton's usual incisive and epigrammatic style. The clever production of a very clever and thoughtful woman, writing throughout at her best."—*World*.

NEW NOVEL BY THE AUTHOR OF "JULIET'S GUARDIAN."
In the press, 3 vols. crown 8vo.

DECEIVERS EVER. By Mrs. H. LOVETT CAMERON.

PARIS.

Copies can be obtained in **PARIS** every Saturday morning of **M. FOTHERINGHAM**, 8 Rue Neuve des Capucines.

Just published, price 10s. 6d.

A NEW WORK BY COLONEL MALLESON, C.S.I.

FINAL FRENCH STRUGGLES IN INDIA AND ON THE INDIAN SEAS.

This Work describes the contest between the French and English Navies in 1783, the damaging effect produced by French Privateering on British Commerce, the capture of the Islands which nurtured the Privateers, and the career of the most famous Foreign Adventurers in India, concluding with an Account of the Expedition despatched from India to co-operate with Sir R. Abercromby in 1817.

London: **WM. H. ALLEN** and Co., 13 Waterloo Place, S.W.

Just published, crown 8vo, 3s. 6d.

THE DECAY OF CHURCHES: A SPIRITUAL OUTLOOK.

"The old order changeth."—*Tennyson*.

London: **SIMPKIN, MARSHALL, & Co.**

Just published, price 1s.

CALL the **EWES** to the **KNOWES**. Duet. The words adapted from Robert Burns. Music composed by **JOHN BULMER, M.A.** Postage free for 25 stamps.

London: **NOVELLO, EWER** and Co., 1 Berners Street, W.

SUN LIFE ASSURANCE SOCIETY.

CHIEF OFFICE, 63 THREADNEEDLE STREET, LONDON.

BRANCH OFFICE, 60 Charing Cross; And at Oxford Street, Corner of Vere Street.

Established 1810.

The Managers have the pleasure of informing the Policy-holders that the Quinquennial Division of the Society's Profits has been made, and that an Option can now be exercised either to receive the Bonus in Cash, or apply it to increase the Sum assured or reduce the Premium equivalently.

The Cash Bonuses on Policies which have been in force more than Four Years average a return to the Policy-holders equal to more than One Annual Premium and a Half.

Assurances effected before Midsummer next will participate in the full Five Years' Bonus at the next Division of Profits.

The new Prospectus, containing important alterations, will be forwarded on application.

J. G. PRIESTLEY, Actuary.

In consequence of Spurious Imitations of
LEA & PERRINS' SAUCE,
which are calculated to deceive the Public,
LEA & PERRINS have adopted
A NEW LABEL,
bearing their Signature, thus:—

Lea Perrins

which signature is placed on every bottle of
WORCESTERSHIRE SAUCE,

and without which none is genuine.

Sold Wholesale by the Proprietors, Worcester: Crosses & Blackwell, London; and Export Oilmen generally. Retail, by Dealers in Sauces throughout the World.

"The Economy of Nature provides a Remedy for every Complaint."—*Shakespeare*.

VICKERS' ANTILACTIC

Is the only known Effectual Remedy for
RHEUMATISM, SCIATICA, and LUMBAGO.

Sold by Chemists, in Bottles, 1s. 1½d., 2s. 9d., 4s. 6d., and 11s.

DEPÔT—CUSTOM HOUSE CHAMBERS,
LOWER THAMES STREET.

PROVIDE AGAINST ACCIDENTS

By taking a Policy of the

RAILWAY PASSENGERS' ASSURANCE COMPANY

The Oldest and Largest Accidental Assurance Company.

The Rt. Hon. Lord **KINNAIRD**, Chairman.

SUBSCRIBED CAPITAL **£1,000,000.**

ANNUAL INCOME **£210,000.**

A fixed sum in case of Death by Accident, and a Weekly Allowance in the event of Injury, may be secured at moderate premiums.

Bonus allowed to Insurers of five years' standing.

ACCIDENTS OCCUR DAILY!!

£1,230,000 has been paid as COMPENSATION.

Apply to the Clerks at the Railway Stations, the Local Agent, or
64 CORNHILL, LONDON.

Prospectuses and Proposal Forms of the above Company free on application to Mr. **W. BURR, F.S.S.**, Managing Director.

SOMETHING NEW.

COLEMAN'S

PHOSPHORUS, QUININE, & PEPSINE

PILLS,

Have a wonderful effect in restoring STRENGTH, especially when Debility sets in from overwork and anxiety, or from whatever cause.—Phosphorus soothes the Brain; Quinine increases Appetite; and Pepsine (one of the greatest discoveries of the age) assists Digestion. One trial will suffice to prove the marvellous effects of this Medicine.

Sold in Bottles, 2s. 9d. and 4s. 6d. each, by all Chemists, or sent free on receipt of 3s or 5s stamps, by the Manufacturers,

COLEMAN & CO.,

20 BUDGE ROW, CANNON STREET, E.C.

NOW ready, post free, **J. SABIN & SONS' CATALOGUE OF BOOKS, ENGRAVINGS, DRAWINGS,** &c.—35 Hart Street, Bloomsbury, W.C. (Near the British Museum.)

CATALOGUE (No. 38, MARCH) of **AUTOGRAPHS and HISTORICAL DOCUMENTS, on SALE** by **F. NAYLOR**, 4 Millman Street, Bedford Row, London. Sent on application.

TIMES NEWSPAPER: a complete File from the Year 1814 to June, 1875, FOR SALE. The Years 1818 to 1860, half-bound morocco, in Fifty-three handsome volumes; the remainder unbound, and in good condition. An offer requested, as the owner desires to sell at once.—Address Mr. **ARNOLD**, 316 Mary-lebone Road, London, N.W.

SIMPLISSIMUS.—LETTER, INVOICE, FILE, and MANUSCRIPT HOLDER. No commercial house or author should be without this useful and simple invention. Prices 3s. to 4s. 6d.; mahogany or walnut, 6s. to 7s. 6d. Send P.O.O. to **W. MILLS' DEPÔT**, 62 Moorgate Street. Agents wanted.

MR. RUSKIN'S TURNER DRAWINGS.—Mr. Ruskin having entrusted to the **FINE ART SOCIETY** his magnificent Collection of Drawings by the late **J. M. W. Turner, R.A.**, for Exhibition, the same will be **ON VIEW** at their Galleries on and after Monday, March 3.

FREEDOM from **COUGH**, and a Comfortable Night's Refreshing Sleep by **DR. LOCOCK'S PULMONIC WAFERS**.—Mr. John Pearson, 67 York Street, Wolverhampton, writes:—"I had no sleep for five weeks till I tried Dr. Locock's Wafers, and I have had such relief to the cough that I could not have believed."—Asthma, Consumption, Colds, Bronchitis, Rheumatism, and all Nervous Complaints are instantly relieved and rapidly cured by Dr. Locock's Wafers, which taste pleasantly. Price 1s. 1½d. and 2s. 6d. per box.

TO GRADUATES.—A Gentleman engaged in Tuition, having Classes for the Local Examinations, &c., wishes to find a Substitute for a short time, or to sell his Connexion.—Address **M. A. Waters' Library**, Westbourne Grove, W.

LONDON FIRST B.A. EXAMINATION.—Mr. **B. REYNOLDS, M.A.**, London and Cambridge Wrangler, will shortly commence **READING** with a **CLASS** for the above.—Address, No. 20 Hereford Road, Bayswater, W.

THE VALE ACADEMY, Ramsgate. Principal, Mr. **M. JACKSON**.—The pupils have long distinguished themselves at the University and other Examinations. Special attention is given to their health and moral training. The **TERM** BEGAN on **JANUARY 22**. Prospectuses, with Honour Lists, on application.

WILLS' BEST BIRD'S EYE.

This Tobacco is now put up in 1 oz. Packets, in addition to other sizes, the label being a reduced facsimile of that used for the 2 oz. Packets. Also in Cigarettes, in boxes of 10 each, bearing the Name and Trade Mark of

LITERATURE.

Gotthold Ephraim Lessing, his Life and his Works. By Helen Zimmern. (London: Longmans & Co., 1878.)

MISS HELEN ZIMMERN has had the mortification, than which no greater can befall an author, to see herself forestalled. In the interval between her planning a *Life of Lessing* and the publication of her volume, another biographer has stepped in, and gone away with the blessing of the critics on his head. Mr. Sime, whose work we reviewed in No. 298, has carried off all the credit which is to be got by a careful *résumé* of Lessing's life, and for the moment has exhausted the interest of the subject. The reading public, whose interest in any German is at best languid, can hardly absorb two *Lives of Lessing* in three months.

Such a piece of ill-luck befalling a book gives its author the strongest claim upon our sympathy. But in the present instance there appears to be no necessity for an appeal to any considerations besides the single one of the merit of the work done. It is bare justice to Miss Zimmern to say that she has produced an honest and substantial biography. She narrates in an appropriate and unaffected manner the facts of Lessing's life. The attitude is neither that of vulgar admiration, nor of patronising condescension. Miss Zimmern has resisted the temptation to praise or to reprove her hero, and is content with the duty of narrator. She is not sensational, and if she is not very interesting, this is partly due to the nature of the subject. For the incidents of Lessing's life are few; and the particularity of domestic detail, which we all read with avidity when we can get it, is wholly wanting.

In one respect Miss Zimmern's book is better than Mr. Sime's: it is shorter—in one volume instead of two. It would have been better had it been still shorter. We have here again tedious analyses of Lessing's works—e.g., twenty pages of *Laokoon*, and the plots of *Emilia Galotti* and *Nathan der weise* retailed to us, though they may be found in every manual of German literature, or prefixed to every school edition of the plays. When will professional biographers come to understand that what we want of them is "life," and that these wearisome abstracts with which they swell the size of their volumes are treated by the reader as mere skip? A review-writer, who is paid by the page, has a direct pecuniary inducement to "pad;" but an author, who has the making of his own book, and therefore would lose nothing by it, should study condensation. He should take to heart the proverb that

"Brevity is the soul of wit," and regard his duty to the public as being to bring his matter into the smallest compass. The practice of all biographers now is the reverse of this. I venture to say that the *Life of Lessing* might be handsomely told in one hundred pages demy octavo, without omitting a single fact of interest, or a single trait of character. I am advocating, not omission, or selection, or even abridgment, but compression. The languid reader of the present day, whom abundance of choice has rendered indifferent rather than fastidious, would be stimulated by the effort at self-restraint on the part of the writer, and would find him much more intelligible. But then to compose one hundred pages on this system would involve much more intellectual effort than to write off 500 on the established plan of authorship. Miss Zimmern praises what she calls the "steely brevity" of Lessing, and his "faculty of expressing ideas with condensed brilliancy, and unexpected terms of praise," and adds that "this concise form of expression is almost foreign to his countrymen." I quote this sentence, not for the sake of saying that "almost foreign" is not English, and that "steely" is scarcely admissible as an epithet of brevity, but to show that Miss Zimmern, though her name argues a German origin, has a perception of the value of terseness as a principle of composition. As a description of Lessing's own style, this is not so good as what Miss Zimmern says in another page (239):—

"The 'Antiquarian Letters' will always be read for their caustic sallies, their drastic vigour, the astonishing vivacity with which purely erudite subjects are treated. . . . Digressions there are none. Never did Lessing keep more closely to the matter in hand. . . . The peculiar charm of his style, its dialectical character, is pre-eminent in these letters, which seem an easy conversation, naturally developing out of itself. No sign of effort or labour is apparent; the reader assists at questions and replies as if they were enacted before him."

This comes much nearer to a characteristic of Lessing's style than "steely brevity." Lessing, though not diffuse and wordy like modern Germans, is not remarkable for brevity. On the contrary, he talks a good deal about a thing, when he once begins upon it. I should say that the quality in which his style is so greatly superior to that of our day is precision of expression, rather than brevity. The object of the modern German author appears to be to remove the idea as far from you as possible, and to surround it with a blue mist of indeterminate abstractions. Lessing places it closely before you, and sharply defines it. His excellence lies in his language, rather than in his style. For this precision of expression is found in him along with great defects; with fragmentary treatment, want of order in the arrangement of his matter, much repetition, and occasional confusion of thought.

A greater drawback from the permanent value of what Lessing has left written is the occasional nature of every line he ever wrote, the plays excepted. Miss Zimmern justly says:—

"It would have been out of keeping with Lessing's mental peculiarity, if he had set out to write a philosophical treatise, *modo et forma*, on

Art. All theory was to him a polemic; he needed an adversary. He loved to argue from the particular to the general."

His mode of life, the melancholy fact that he had to earn bread to eat by daily penning something which he could sell to a publisher, had much to do with this production of fugitive fly-sheets. Partly, too, it is the inherent vice of the profession of critic. The critic is not a creator, but a judge; he must wait for his inspiration till some creative mind has produced something original. Lessing was not a creative genius, but only a sympathetic arbiter of taste. This, I conceive, is the reason why Hegel, when he has occasion (*Aesthetik*, iii., 3) to speak of "that generation of great Germans who started the new epoch of Art in their native land," singles out Klopstock as the leading figure among them, and does not so much as name Lessing, in capacity of intellect and acquirements so vastly superior to the author of the *Messias*.

Miss Zimmern has a very good paragraph on Lessing the man, as he was to be seen in daily life:—

"Spittler had free access to Lessing's house, was in daily intercourse with him, and would listen to the treasures of wisdom and knowledge which he ungrudgingly poured forth. Lessing's conversation was pre-eminently suggestive and stimulating. He spoke fluently and well, in a penetrating, agreeable, baritone voice. He never monopolised the conversation, but was always attentive to draw others into its flow; and, though he could not disguise his ample and versatile learning, his talk in the social circle was never pedantic or beyond the comprehension of all his hearers. He detested the schoolmen, who wanted to draw him into a corner and discuss pedantic trivialities. In writing he could be the minute scholar as well as any of them, but in the circle of his home or friends he was the genial host. His easy and graceful deportment nowise betrayed the sedentary bookworm. He was also distinguished from the typical German man-of-letters in his uniformly neat dress, always made with quiet elegance and attention to fashion. There was something characteristic in all he said or did. His manner was decided and firm, but free from the slightest taint of arrogance. A winning benevolence shone out of his deep-blue eyes, eyes that were his greatest beauty, whether they danced with merriment, flashed with anger, or looked boldly out into the world. It was a joke among his friends that everything Lessing did was idiosyncratic and original, from his tread to his knock at the door. His house was appointed with the same unostentatious elegance that appeared in his dress. Disorder and dirt were his enemies; and, profoundly learned man as he was, his study did not show the outward untidy signs so often held *de rigueur*."

"Profoundly learned" is a powerful epithet, applicable to but a few names in the history of literature. I will not contest Lessing's title to it; but I wonder whether Miss Zimmern realises the force of her own words? What makes me doubtful on the point is that in another page (140), Rector Arletius and Rector Klose are both "profoundly learned men." Rector Arletius, it seems, "could account for every Greek and Latin word." I do not know if "to account for" is to know the meaning of. But if Rector Arletius did this, then he was more "profoundly learned" than Lessing. For Lessing, Miss Zimmern tells us (p. 232),

"named" "enthusiasm" or "divine madness" ἀκμή. In what part of his writings Lessing "names" divine madness ἀκμή I have not discovered; but I find him in *Laokoon* translating Κρονίων "son of time." Perhaps these are "pedantic trivialities," and Miss Zimmern will despise me for noting them, or else I would ask why she translates (p. 39) *Flickstein* "bungler" when it means something very different?

Lessing, it will be admitted on all hands, was not only greater than a pedant, but greater than the mere scholar. He comprehended the Greek genius, and felt for it an affinity which is totally wanting in the German scholar of our day. I by no means wish to speak lightly of the devotion of the German philologists to Greek learning, but it is due to Lessing to say that, whereas the modern scholar understands Greek books, Lessing understood the Greek mind. With what unerring instinct, e.g., he fastened on the fragment we have of Aristotle's *Poetics*, as having embodied, once and for ever, the true principle of Poetry, lost sight of amid the trivial disputes of the French critics of the Boileau school, or the wrangle of the Saxon and Swiss poets, which was the literary atmosphere of Lessing's youth. The *Dramaturgie* is little else than a continuous iteration of Aristotelian principles, and remarkable—will Miss Zimmern permit me to say it?—for anything but "brevity." And in *Laokoon* the leading idea is drawn again from the *Poetics*. For, in spite of the second title of the book, *The Limits of Poetry and Painting*, and in spite of Lessing's own declaration in the Preface that what he has in view is to draw the distinction between the spheres of the sister-arts, an attentive reader will easily see that the aim goes much beyond this. As Gotschlich has remarked, the *Laokoon* is a fragment, and must always be studied along with the pieces in the second volume of the Works, entitled *Zum Laokoon*, and with the *Dramaturgie*. It will then be apparent that Lessing's central thought throughout is the Aristotelian principle that only the representation of moral agents acting is the province of poetry; only, instead of dogmatically starting with this principle, and reasoning deductively from it, Lessing leads up to it from the concrete example of the marble group of the *Laokoon*. It was the habit of his mind, as Miss Zimmern truly observes, "to argue from the particular to the general." Fragment as it is, confused in parts, rather (as the author himself confesses) "unarranged collectanea for a book than a book," Lessing's *Laokoon* has been more stimulative of reflection than far more complete treatises on the theory of the arts. Macaulay told Mr. Lewes (*Life of Goethe*) that "the reading of this little book formed an epoch in his mental history." And of Lessing's Works in general it may be said that their value lies, not in their didactic contents, but in the intellectual impulse derivable from them. Nowhere is such a variety of suggestive hint to be found collected together. For this reason the thirteen volumes of Von Maltzahn's edition, in spite of the disgusting smudgy type in which they are printed, must always be at hand on the shelves of every scholar, critic, and

literary man. And in Miss Zimmern's *Life* we have now a very useful introduction, in English, to the *Sämmtliche Schriften*.

MARK PATTISON.

Political Science; or, the State Theoretically and Practically Considered. By Theodore D. Woolsey. (London: Sampson Low & Co., 1878.)

THE work before us represents the matured results of five-and-twenty years of professorial studies at Yale College, where the author was President but lately. It does not consist, however, of the lectures actually delivered there; but the materials collected for them have been rearranged in a comprehensive course of Politics, which deserves respectful notice, and meets a recognised want. In the Oxford School of *Literae Humaniores* it was the custom a few years ago to give the candidates for honours an examination paper which bore the somewhat pretentious title of "Political Philosophy." It was a natural criticism on this practice that there was no text-book on the subject which could be put into the students' hands, and that the questions therefore corresponded rather to the note-books of the College lectures, and to chapters recommended here and there in authors of very different schools of thought, than to any well-defined limits of methodical enquiry. The answers frequently reflected the latest theories of modern works; they illustrated Aristotle by Sir H. Maine and Mr. Herbert Spencer, Bagehot and Mill; but they exhibited, it must be owned, a rude appetite for miscellaneous fare, which was not always properly digested.

It is a merit of the work before us that it does attempt to mark the limits of enquiry and lay a systematic course before the student, in which enough of the facts of history are marshalled to furnish a wide inductive basis for the conclusions afterwards discussed.

The book is divided into three parts of unequal length, the first of which corresponds to what the Germans call *Naturrecht*, and deals summarily with the nature of justice and the analysis of rights as implied in the existence of the political community. The second is concerned with the theory of the State, with opinions as to its origin and nature, its sphere and ends and proper limits, and the analysis of its right to punish crime, together with various theories and fundamental questions of what has been distinguished in foreign treatises as *Staatslehre*. The third and by far the larger portion of the work deals with the more practical aspect of the subject in an historical summary of the distinctive types of government as they have been realised in actual life.

After some four hundred pages filled with the compressed analysis of these constitutional forms, a series of chapters follows on many of the controversial questions of the day in the Relations of the State to the Protection of Industry, to Education, the Relief of the Destitute, Morals and Religion; and some of the problems are discussed which grow out of the encroachments of the central power on local

institutions, as also of the organised action of great parties in the State. It is true, as the author is already sensible, that this division is not without its drawbacks. Some questions stated in their abstract form in the theoretical section of the work require a fuller handling of their practical aspects later on. The necessary result is, not only occasional repetition, but also the appearance of a somewhat jejune and meagre treatment of great topics in the earlier chapters which may prejudice a hasty reader. Socialism, again, though its discussion in the second part may be technically justified by the conflict of its fundamental dogma with the recognised theories of the State, yet has stepped into the arena more than once of late in forms so menacing to the existing order of society as to deserve a more detailed exposure in an analysis of the actual forces of the present. But indeed, in the main subjects of the treatise, the workmanship is very far from being slight or unsubstantial; rather, it may seem too solid and compressed for ordinary readers. An abundant stock of materials has been provided by a wide historical survey, and the characteristic features of the systems due to political theorists of note have been carefully summarised and balanced. It would be difficult to find a work upon this subject covering so much ground and containing so much fullness of detail.

It is of special interest to notice that, when the institutions of democracy are handled, the writer freely refers to the politics of the United States to illustrate the experience of other countries. Valuable as seems this source of evidence, it has been drawn from scantily in the general treatises of European writers on the subject, notably in one referred to by our author, Prof. Wachsmuth, who in his history of Political Parties devoted four pages only to America out of his nearly sixteen hundred. But it is a distinguishing merit of the work before us that it deals with this experience in a spirit of such fair and candid criticism, without patriotic bias or undue depreciation, though some of his readers nearer home can hardly fail to be offended with his unfavourable estimate of one or two marked features of their Constitution. He describes the evil effects upon the Civil Service of the use made of the Presidential right of patronage, and he exposes the machinery of "caucuses" with judicial gravity, though with no lack of personal interest.

In general it should be said that there are no traces in the work of novel theory or startling paradox, and that its author appears chiefly as the exponent of accepted data and verified conclusions. But his judgment is not overweighted by his learning. He reviews with independence the opinions of other thinkers; sweeps aside, for example, almost contemptuously, the revolutionary views of Herbert Spencer as to property in land; rejects emphatically the analysis of rights which is accepted in the school of Locke and Austin, with all the leading principles of the Utilitarian Philosophy; freely discusses the opinions of William von Humboldt and Mill on the limits of State power; and exposes the loose, precarious

nature of the wide generalisations which abound in the *Esprit des Lois* of Montesquieu, though he is evidently much impressed with the authority of so great a name.

His style is somewhat cold and colourless, and may seem needlessly unattractive in the earlier and more abstract portions of the work. His arguments are often stated with a simple brevity which disdains to use ornaments or stir the fancy, and the reasoning is sometimes as close and concentrated as an Aristotelian chapter.

His choice of words and phrases is not, indeed, always beyond criticism, and without being fastidious we may be ill content with "jural," "placated," "indirection," "race principle," "lying back of," "heaped up upon," and States "not sovereign except by catachresis;" some of which might possibly have been included in the lately published list of terms prohibited by an editor of the United States to his contributors.

The corrector of the press has not been always duly careful in his work, and the short list of "Errata" given might have been considerably extended. Thus, for "last" we should read "best," i., p. 36, and *plebs* for *populus*, ii., 27. "Schönemann" is an error more than once repeated for "Schömann." By the same cause we may probably explain the confusion as to geometrical equality in i., 28, the obscurity in the last sentence on p. 29, the loose statement in another on p. 38—due probably to a misplaced comma—and two paragraphs in p. 29, which are meaningless as they now stand.

But it would be ungracious to insist at greater length upon these drawbacks, which fortunately become less numerous as the interest of the work increases. In the many pages covering so wide a field of political enquiry, and touching on so many controversies, it would be easy to find points of difference for a critic to discuss; but the work is of real value, and the author deserves the thanks of future students of politics for adding to their library of reference a solid and trustworthy and comprehensive text-book. W. WOLFE CAPES.

The Via Media of the Anglican Church. By J. H. Newman, D.D. In Two Volumes. With a Preface and Notes. (London: Pickering, 1877.)

THESE volumes consist of "The Prophetic Office of the Church"—one of the most acute and solid, though one of the least impressive, of the author's works—and of a large number of letters, and tracts dating from 1830 to 1841, beginning with a letter to the resident clergy of Oxford inviting them to support the Church Missionary Society with a view of discouraging missionary meetings—as then and now conducted—and ending with the well-known letters to the Bishop of Oxford and Dr. Jelf in defence of Tract 90, which reappears shorn of a little unnecessary vituperation of the writer's present belief. So, too, the original tracts on the *Via Media* lack the definition which the author gave in 1834 of the difference which in his judgment divided the Anglican and Roman doctrine; and when we turn to the Retractation at the end of the volume we find that the passage

had already been suppressed for several years in 1841.

Besides this there is the tract on "The True Method of Conducting the Controversy with Rome," and the letters to the *Christian Observer* in defence of Dr. Pusey's tract upon Baptism. There are two points which may be noticed in the last: one is that the author stands throughout in the attitude of a defender of liberty: he claims that a question which the formularies leave open shall not be closed by partisans; another is that he lays rather disproportionate stress on the Canon of 1571, which does not, as the writer seems to suppose, bid preachers to enforce as Scriptural doctrine whatever the Fathers taught as such, but forbids them to enforce any doctrine which is not Scriptural and can be proved to be so from the Fathers. We do not notice anything like a retractation of a very questionable position which is an essential part of the case the author once endeavoured to construct against his present creed. It is not surprising that he says nothing of a very perplexing assumption which runs through all his Anglican criticism of popular Protestantism: according to him, the Creeds which resulted from the controversies of the fourth and fifth centuries are among the most precious treasures of the Church—though they are protests against forgotten errors, they set eternal truths in clearer light. According to him, the way the Church of England decided the controversies of the sixteenth century was quite right so far as it went; at any rate it was a sufficient safeguard against definite errors, so that we were at liberty to forget the controversies of the sixteenth century and fall back upon Patristic theology. Now, to Anglicans like Dean Hook or Bishop Wilberforce this would have been as shocking as a proposal to fall back upon Ante-Nicene theology while retaining the Creeds as a safeguard against forgotten errors. The author admits that the Articles from "the sixth to the eighteenth contain one certain view brought out in its particular form at the Reformation," and this view is just the essence of Protestantism, the justification, if there is one, of the Reformation. This positive doctrine was as precious to Hooker as to Cartwright, to Ridley as to Hooper; none of them regarded the assertion of it as a mere protest against scholastic and mediaeval corruption, and it is the failure to recognise this that makes the *argumentum ad hominem* against modern Protestantism from the authority of the Reformers in the *Via Media* as unconvincing as it is ingenious.

The same omission rather vitiates the writer's criticism of the Protestant rule of faith in "The Prophetic Office." He speaks as if every consistent Protestant claimed to interpret the Bible for himself by dint of pure scholarship, or else by a mystical personal illumination. The truth is that Protestants interpret the Bible by tradition just as much as Catholics, only they will not own it. The Protestant has the practical advantage that his tradition (he calls it "the Gospel") looks much easier to understand than the Catholic, and that it makes the Bible look much easier to understand than it is. It has the logical disadvantage that it rests

upon no authority in particular, and that it leaves a great many of the most characteristic parts of the Bible unexplained, as Dr. Newman shows with great effect. On the other hand, the Protestant makes a much more confident and compendious appeal to the experience of ordinary believers than the Catholic, who scarcely thinks that the promises are fulfilled in this life except to the perfect.

This would hardly have been, perhaps it hardly is, an objection in the eyes of Dr. Newman: his criticism of the Roman Catholic rule of faith is that it is too clear, too systematic, too complete, while the Anglican rule of faith has the advantage of being better borne out by Church history, while it is quite sufficient for the guidance of religious, well-disciplined minds—the only minds, it is implied throughout, who can expect to find or profit by safe guidance. In the present edition we are referred to the essay on "Development of Doctrine" for a reply to the historical difficulties, which perhaps the author has rather outgrown than answered. Another set of difficulties on which great stress is laid in the original work comes from the practical working of Roman Catholicism, which scandalises many who might otherwise accept the authoritative teaching of the Church as set forth in dogmatic decisions and the accepted theology of the schools. In the Preface to the present edition he undertakes to reply to this by pointing out that the Church has a Royal and a Pastoral as well as a Prophetic office, that always to proclaim exact theological truth might do more harm than good, and that some theoretical questions, such as heretical baptism, have been happily settled to the approval of Anglicans by an appeal to these practical considerations. Still, it is admitted that in adjusting the claims of the three offices the hierarchy and even the Pope may make mistakes—not insisting when they ought, insisting when they ought not—for no Pope is impeccable. It is admitted that in any nation where unhesitating faith is general, there will be much superstition; which suggests the question whether upon this view a dogmatic revelation with the costly machinery for guarding it is really a boon to mankind. It is admitted also that there is a large toleration for different views of doctrine, different tempers of piety, within the pale of the Roman obedience; and this suggests the question whether the unity within that obedience is real, whether the author of the *Apology*—shall we say?—is not more nearly of the same religion as the author of the *Analogy* than of the Neapolitan crone who chatters to her crucifix, or the Neapolitan brigand who wears a scapular and perhaps punctually fulfils all the special obligations which that implies, while neglecting all the ordinary duties of a Christian.

G. A. SIMCOX.

The Great Thirst Land; a Ride through Natal, Orange Free State, Transvaal, and Kalahari Desert. By Parker Gillmore. (London: Cassell, Petter & Galpin.)

BEFORE reading this book I saw an advertisement of it in the *Times*, as many others

may have done, in which the above title was supplemented by the words, "Including a description of the unknown lands lying between the Limpopo and the water-sheds of the mighty rivers lately explored by Stanley and Cameron, as well as the scene of the present war on the frontier of the Cape Colony." Taking it up in the full expectation of gaining a knowledge of the country of the Galeka Kafirs and of learning something new about the southern tributaries of the Congo, I read on from chapter to chapter—for the book is an interesting and well-written one—to the very end. Will it be believed, there is not a word in it about the scene of the present war on the frontier of the Cape Colony, not even a suggestion of the existence of such a disturbance? Indeed, though there is not a single date in the book, even on the title-page, incidental references show that the journey it describes was made before there was any thought of another Kafir outbreak; and no part of the author's route lies nearer the Transkei than we are to Germany. As for the "unknown lands between the Limpopo and the watersheds," the parts of the Limpopo basin that were visited by the author have been crossed by many travellers since the days of Gordon Cumming, and he was never within a six-months' journey of any stream draining to the country explored by Cameron and Stanley. Mighty rivers, forsooth! The very title chosen for the book refers to the want of water in the dry sands of the Kalahari. If a New Zealander, having made a journey in France, had gone back to his native island and written a narrative of his travels there, and this had been announced as "including a description of the unknown lands lying between the Rhine and the Polar ice lately explored by Parry and Nares, as well as the scene of the Turkish war," the case would be very nearly a parallel one to that of this book. The work, however, in itself makes no pretension to be anything more than is indicated in its real title; and the author, to judge of him from his own writings, would be the very last to wish his work launched under false colours.

Confessing to a feeling of irritation at having been misled, let us see what the book does contain. It is the narrative of a journey to the eastern border of the Kalahari desert, "written with the hope of amusing and instructing the general reader, as well as to impart information to the sportsman that will enable him to find the lion and the elephant."

Landing at Port Natal it takes us up over the Drakenberg range to the high plains of the Transvaal, and across these to the hunting-grounds of King Kama of Soshong in the upper basin of the Limpopo river. The return route passes along the eastern side of the Kalahari, through King Sechelle's town to the diamond-fields of Griqua Land West, and thence to Cape Town.

Pleasantly and graphically written sketches of scenes and adventures along this route fill the volume. The difficulties and mishaps of "trekking" with the lumbering ox-waggon; the scenery of the Drakenberg and the high plains; the Boers and natives; with hunting hazards and escapes innumerable,

give material to keep up the unflagging zest and excitement of the narrative. Among the most generally interesting parts of the volume before us at the present moment are those which describe our newly re-included fellow-subjects of the Transvaal—the Boers who migrated hither from under British rule more than forty years ago. Taking them as they come, the general impression given by Mr. Gillmore's work is that there are Boers and Boers. The first of these met with, for example, are rather prepossessing, stalwart, fair men, dirty and rude, but honest and trustworthy. Those of their number who are most determinedly opposed to British interference belong to the sect called the "Doppers."

"Their dress is a short single-breasted coat, trousers very loose, and peculiar-shaped broad-brimmed hats. They consider themselves to be the chosen people of God, and are still in search of the Promised Land, which they profess to believe exists further north in the interior of Africa. The heathen, they say, have been given them as a heritage, so they are slave-owners. They are brave and fearless, constantly carrying on war against one or other of the native tribes; and when actually engaged in hostilities, spare neither sex, but carry off the young children to be reared as bondsmen. They are hard masters, not sparing the lash, and exacting for the food their folks (slaves) get, constant and severe labour. No kind look or even word here cheers the slave's task, for no bond of sympathy exists between the Dopper and the black man. His horse he takes pleasure in, his cattle he is proud of, but a heathen merits not a thought. . . . The black population of these parts love not the Boers, but hate and dread the Doppers."

Towards the end of the book, when homeward bound, the author reaches the diamond-fields, and gives a capital description of them and the heterogeneous population that has gathered to the diggings. Altogether the book is a very entertaining one, and if no expectation had been raised beyond those which it realises, the impression left by its perusal could not be other than pleasant.

K. JOHNSTON.

Œuvres Complètes de Diderot. In Twenty Volumes. Edited by J. Assézat and M. Tournoux. (Paris: Garnier, 1875-7.)

Few authors of eminence have hitherto stood so much in need of a new and complete edition as Diderot. Up to this time the standard text (so far as there is any that can be called standard) has been that published by Brière in 1821. This is not only expensive, cumbrous, and ill-arranged, but also (even if the four volumes of *anecdota* published in 1830 be added to it) by no means complete. It may, indeed, be doubted whether a really complete edition is possible, not only because of Diderot's well-known "ostrich-like indifference" to the fate of his work, but also because a large proportion of that work is embedded beyond the possibility of identification or extrication in the work of other men. But it should be possible to collect and arrange at least all his separately published pieces with those available in MS., and this is the task which to the great joy of every student of eighteenth-century literature was two years ago undertaken by M. Jules Assézat. That the editor possessed the necessary qualifications of

knowledge and sympathy was amply testified *inter alia* by his dainty little edition of La Mettrie's *L'Homme Machine*, which appeared some ten years ago, and the promise has been fully redeemed in the present great undertaking. Unhappily he succumbed to an attack of heart disease when about three-fourths of the volumes had appeared, and before he had had time to do more than assemble materials for the *étude* on Diderot which was to finish the work. M. Maurice Tournoux undertook the duty of seeing the rest of the edition through the press, and has subjoined such of the materials referred to as were available; but he has wisely not attempted at such short notice to carry out entirely his predecessor's design. M. Assézat's death is much to be regretted, though we in England have the consolation of knowing that Mr. Morley's book, which will soon appear, will to a certain extent compensate for the loss of the projected *étude*. Meanwhile the deceased editor's work must be very highly spoken of. Every now and then, perhaps, he indicates his manuscript sources with less precision than a disciple of the strictest school of modern editing might wish; and it is probable that an English or German editor would have consulted in person the MSS. in the Hermitage of St. Petersburg, which are the chief sources of new matter, instead of relying on transcripts made some time previously with a different object. But his arrangement is generally excellent, and his Introductions to the various works are so admirably full and readable that the loss of the general *étude* is hardly felt.

The actual new matter in this edition is considerable. It consists of a very lengthy refutation of Helvetius' *De l'Homme*; a treatise on Physiology, or rather notes for such a treatise, also of great length; a very much enlarged version of the "Plan for a Russian University;" several sketches of proposed dramas; half-a-dozen new poems; thirty new letters, and many scores of small articles and notes on every conceivable subject. But, besides its absolute novelties, the edition unites a great deal not to be found previously except in a hundred different publications. Thus we have for the first time a complete reissue of the invaluable "Salons." Also there is a bulky selection on new principles from the *Encyclopédie*—a selection scarcely, perhaps, inspired by M. Assézat's ordinary good sense. But of this more hereafter.

Meanwhile, we do not fear to assert that the new matter can hardly exalt, and will assuredly not lessen, our estimate of Diderot's importance. That importance has been occasionally misunderstood by his critics both earlier and later. It has not been unusual to represent Diderot as a man of great and pregnant ideas, and a forerunner of modern scientific thought. This representation, if not absolutely mistaken, fails, as it seems to us, to seize the real *virtue* of the philosopher. Nor is its truth at all necessary to a very high estimate of his powers and position. The real greatness of Diderot seems rather to lie in the fact (recognised by Goethe) that he had a "peculiar individuality:" that his views, whatever they might be, were held and put

in a manner which bears the mark of genius, and is not the manner of any other man; that if we had not Diderot we should lack something which no other man could supply.

Take, for instance, his philosophical treatises, or, to call them by their real name, his attacks on Christianity. The peculiar excellence of Diderot does not here appear as it does in some other of his works, notably in his masterly "Salons." But even in these hastily written treatises, much of the matter of which is a mere repetition of what others had said, or at least a somewhat slovenly utterance of what was "in the air" at the time, not a little of that peculiar excellence may be observed. Compare, for instance, Diderot's manner of dealing with these questions with that of such representative men of his sect as Voltaire and Naigeon, and its superiority will be obvious at once. On the one hand, there is little or nothing of the levity which continually offends and disgusts one in the *Dictionnaire Philosophique* and others of Voltaire's works. On the other, the ridiculous missionary-atheism of some of the smaller *philosophes*, the *feu d'enfer* which Chénier so happily ridiculed, is equally absent. Diderot has adopted certain views on a certain subject. These views he defends and champions, not by mopping and mowing at his adversaries, nor, on the other hand, by endless sermons on the beauty of unholiness and the wickedness of those "qui décréteraient l'être suprême," but by such good downright blows as a stout arm and a somewhat happy-go-lucky skill of fence enable or allow him to deliver.

Take, again, a subject which is not very savoury, but which can hardly be omitted in any notice of Diderot—the very singular freedom of his language. We think, indeed, that Mr. Carlyle has somewhat exaggerated this, as M. Assézat has undoubtedly underrated it. We of course leave out of consideration the *Bijoux Indiscrets* as a production altogether indefensible, admitted to be so by the author himself. But in his other works it is soon clear to a careful observer that, in this as in the former case, even one who cannot sympathise with what Diderot says and does, may perfectly comprehend, and even to some extent admire, his motives and his manner of speaking and acting. He sees that certain feelings and desires do, as a matter of fact, occupy a very important place in the drama of most men's, if not of all men's, lives; and being above all things an anthropologist, he misses no opportunity of collecting any fact or phrase which may illustrate these feelings, and imposes no restraint on himself or others in speaking about them. We, on the other hand, may insist on the paramount importance of submission to existing conventions. But we must admit that his view may, *prima facie*, commend itself to a man of understanding and morality; and we must, above all, distinguish between such outspokenness and the sniggering and tittering indelicacy which disgraces Voltaire.

As in these crucial instances, so in almost all others it will be found that, while the importance of what this writer said or did is

very often exceedingly questionable, the interest of the way in which he said or did it, of the point of view which he took, and of the interconnexion of his thoughts is extremely great. There can, therefore, be few greater mistakes than to regard Diderot merely or mainly as an exponent of "ideas," whose faulty manner may be excused in consideration of the value of his matter. Impartially examined, Diderot will be found to have less original value, if looked at in this way, than almost any man of equal eminence. It would be perfectly just to vary the well-known qualification of his great contemporary, and to say that "il avait plus que personne les idées que tout le monde avait." No doubt it was impossible for so vigorous a genius as Diderot to refrain from exhibiting intense and varied originality in the treatment of the ideas which presented themselves to him. But he took, and, if we are not mistaken, would always have taken, merely the prevalent thoughts and fancies of the time, without giving himself the trouble of going out of the highway or digging beneath it. It was the trick of the time to attack Christianity, and Diderot attacked with the most eager. Physical science, sociology, questionable novels, were all pet subjects of the hour, and Diderot grappled bravely with them all. It would be almost impossible to produce a weaker argument for or against any given idea, doctrine, or position (other than aesthetic), than that Diderot was for or against it. But his real eminence and his real attraction lie in the manner in which he treated these common and chance materials. The French Romantic school did not err in singling him out among the great names of the past century for exceptional favour, for it is his manner alone by which he is justified. The subject in him becomes, to a qualified student, all but invisible; everywhere we see Diderot himself, his electric quickness of intelligence, his many-sidedness of view, his quintessential individuality, his freedom (in seeing, though not in choosing his objects of sight) from conventionality and prejudice. One of the faultiest artists possible, he yet stands almost alone in the intensely artistic quality of his mind and of his handling, of his thought and of his work. He deserved the often quoted and often debated epithet of encyclopaedical: not at all because he edited an encyclopaedia, nor even because he actually wrote, talked, and thought on many and various branches of knowledge, but because his habit of mind prepared him to write, think, and talk about anything which presented itself. Hence also was it that he sometimes, though unjustly, appears superficial, and often and justly incurs the reproach implied in Marmontel's well-known remark, "Good pages, no good book." His peculiar union of quickness and dexterity in comprehension, of readiness in seeing where to plant his grasp and alacrity in planting it, enabled him to obtain a (for him) sufficient hold of his subject, without any of the detailed exercise and preparation which slower if more scientific natures require. The process might be said, we think, generally was thorough, but the representation of it could not but look

superficial to minds of a different cast. And it is not to be denied that his admirably artistic appreciation was unaccompanied by a suitable faculty of artistic creation or even expression. His rapidity of apprehension was conjoined with an equal rapidity in relinquishing what he had grasped. Hence it is that he appears to far better advantage in his "Salons" and his correspondence than in his regular treatises. In his casual remarks, in his almost chaotic collections of disjointed criticism or description, he is unrivalled. But his hand is at least as hasty as it is adroit.

For confirmation of these remarks we must refer the reader to the ten thousand or more pages before us. In setting about the arrangement of this vast mass, M. Assézat adopted the principle of division by subjects, the works being arranged chronologically under each head. These heads are eight in number—Philosophy, Belles Lettres, Science, Fine Arts, the *Encyclopédie*, Travels, Miscellanies, and Correspondence.

In Philosophy, the new refutation of Helvetius, though crammed with evidences of its author's acuteness of thought, and of his extraordinary faculty of illustration, labours under the disadvantage of being a page for page commentary rather than an original and connected work. Hence it is hardly in a position to wrest the palm of interest from the remarkable progressive series of philosophical works which ranges from the "Essai sur le Mérite et la Vertu" to the "Lettre sur les Sourds et Muets." We say progressive, because, though we cannot accept the precision with which some writers make Diderot a rationalist in the first of these works, a deist in the second, a sceptic in the third, and an atheist in the fourth; there is no doubt a certain progression, if not in the author's views, at any rate in his intentional expression of them. All these works are interesting (save, perhaps, the first) as specimens "de la philosophie comme on en faisait autrefois;" and strange as they may appear to persons only accustomed to the philosophy of the present day, the presence of thought and talent may, perhaps, be found in some measure to compensate for the absence of method and terminology. They present, moreover, some individual points of interest. The "Promenade du Sceptique" looks a little like an attempt to copy and rival *Alciphron*. The "Lettre sur les Aveugles" and its sequel "On the Deaf and Dumb" offer a good opportunity to anyone who wishes to raise one of the most unprofitable of literary questions—a question as to priority of ideas between Diderot and Condillac. But the last of M. Assézat's two new "Pensées Philosophiques" is of peculiar interest, as exhibiting probably the germ of the famous eighteenth chapter of the *Système de la Nature*.

In the section of Belles Lettres the numerous plans and sketches of projected dramas will naturally attract some readers. There is, however, we think, more characteristic interest in the recovered critical sketches to which we have alluded. Written for the most part on works of which not one student of French literature in a thousand has ever even heard, they are still readable, from the extraordinary, and indeed, unique

faculty of appreciation which made Diderot the prince of all reviewers, past, present, and to come. As to the larger and previously known works of this section, we have unfortunately here no space to speak. Suffice it to say that admirers—and who that has read it is not an admirer?—of the immortal *Neveu de Rameau* will find an excellent notice of that strangely-historied work, and a new text derived from a rather unduly mysterious “copie sans date.” It is also worth mentioning that M. Assézat is almost the first Frenchman who has done justice to *Jacques le Fataliste*, a book worthy of the vigorous days of the sixteenth century, and far more fit to be compared with *Pantagruel* than the wretched stuff which has sometimes had that honour.

Under Science, the place of honour must be given to the now first printed *Éléments de Physiologie*. It is, as we have said, merely a collection of notes; but it forms a curious companion to the *Rêve de d'Alembert*, and is besides, full of the random but suggestive thoughts in which Diderot was so fertile. It has a certain link of connexion with La Mettrie.

The three bulky volumes of Fine Arts should be equally welcome to artists who love literature and to men of letters who love art. Their contents have been already alluded to in the ACADEMY by a writer far more competent to speak than the present reviewer; but it cannot be too often repeated that Diderot was actually the creator of the art of picture-criticism, that he had in this line absolutely no forerunners, and that everything good which has been done in it since has been a following, conscious or unconscious, of his manner. Of how many writers can such a thing in any department of literature be truly said?

With the selection from the *Encyclopédie* we have, as we have hinted, a small crow to pluck. We do not grudge the five volumes which it occupies, very far from it. And it is possible that the extraction of the whole of Diderot's work would have been impossible. But if a selection had to be made we cannot doubt that the articles on manufactures and technical subjects on which Diderot, as is well known, bestowed infinite pains, and which he was the first to treat with anything like literary skill, should have been preferred to such things, for instance, as articles on mythology, which are mainly paste and scissors. That the matter of the former is out of date—the excuse alleged—seems to us no disqualification, and is besides compensated by a certain antiquarian interest. But what we really want is to see the way in which Diderot treated these things, and the mere fact that the things themselves are obsolete does not interfere with our wish.

Of the Travels and the few *œuvres diverses* there is not much that needs to be said here, and of the delightful correspondence Mr. Carlyle and Mr. Morley have relieved us from the necessity of speaking. We, therefore, leave this book to the appreciation of readers. Few can be expected to read it with interest throughout, though we could mention many worse employments of time and not many better. But there is hardly anyone who will not in one or other of the twenty

volumes find some subject of special interest to himself treated in a manner which throws new light and new interest upon it. This we have already said is Diderot's special charm and his special value. Had the editor been spared to complete his task, there would probably have been but few complete editions which would have equalled this. As it is, there are not many that surpass it.

GEORGE SAINTSBURY.

Bibliotheca Cornubiensis. By George Clement Boase and William Prideaux Courtney. Vol. II. (London: Longmans & Co., 1878.)

We are glad to welcome the issue of the second volume of this valuable work. The public, as well as the authors, may be congratulated thereon. Messrs. Boase and Courtney have now succeeded, after several years of patient labour, in getting through the alphabet from A to Z, and have given a list of authors and of works connected with the county of Cornwall which may vie with that of any county in England. The amount of labour, learning, and perseverance displayed in this undertaking is astonishing. The authors, in the Preface to their first volume, very modestly disclaim for their work any pretension to the title of a complete Bibliography of the county. They state that their object is to furnish a catalogue—first: Of all the works written by natives of Cornwall, members of Cornish families, and persons resident in the County; secondly: Of all works relating to the County, even though written by persons unconnected therewith—and they determined to include within the scope of their work, not merely books of permanent interest, but also pamphlets, political tracts, literary and scientific papers, reports of societies, patents, dramas, music, songs, extracts from sale-catalogues, maps, manuscripts, &c., &c. This is a very wide range, and the authors, while they have amply fulfilled their promise in all its branches, have gone far beyond it, as a glance at their ample pages will abundantly show. They have, in many cases, allowed the names of authors to appear in their work whose connexion with the county has been exceedingly transient, and hence they have enriched their pages with names which we should not otherwise have found therein. As an illustration, our amiable and accomplished friend Mr. Planché, Somerset Herald, finds a place in the *Bibliotheca Cornubiensis* simply because while on a visit to Penzance in the autumn of 1868 he sketched out his “Pieces of Pleasantry for Performance during the Christmas Holidays,” which he dedicated to Lady Molesworth; and wrote some verses upon leaving Pencarrow, after a brief visit there in 1872. But our authors have by no means neglected native writers. The works of many occupy several double-column pages: those of the Rev. R. Polwhele, the historian of Devon and Cornwall, upwards of ten, while nearly as much space is needed to display the productions of the pens of Bishop Trelawney, Dean Prideaux, and Sir Harris Nicolas. Though it is probable that some pamphlets or tracts relating to the county have been omitted, the authors would

seem to have ransacked every public and many private libraries to obtain materials for their work, and they tell us that they have, moreover, consulted living authors with respect to their works, and the friends and relations of those who are deceased. It is therefore probable that, from the care which has been taken in its compilation, this work in accuracy and completeness will favourably compare with any other of its class.

The authors, however, do not limit themselves to bibliographical information. Beyond this they have given very valuable biographical particulars of the many eminent men who have enriched our literature, and supplement, in many cases, this information with interesting notes of incidents in their lives. There is scarcely a Cornish family of any antiquity or eminence with respect to which some information may not be obtained from the *Bibliotheca Cornubiensis*. That in a work of this wide range the authors should have fallen into some errors, especially with respect to biographical details, which is not one of their principal objects, was unavoidable; nevertheless, there is much evidence of the care they have taken to be in all respects accurate.

We are glad to see that, in addition to the two volumes already issued, there is to be a third, now far advanced, which will contain an alphabetical arrangement of miscellaneous matter that could not be classified under the names of authors; a list of local Acts of Parliament and Civil War pamphlets relating to the county; a supplement showing the works of recent date, &c., together with a complete index to the contents of the entire work. To the completion and issue of this we shall look forward with much interest.

JOHN MACLEAN.

The Life and Times of the Right Hon. John Bright. By Wm. Robertson, Author of “Rochdale: Past and Present.” (Rochdale, 1878.)

THE author of this work is a newspaper reporter, who has lived in Rochdale for the last seventeen years, and publishes it himself at the office of the *Observer*, a local paper. The little volume (small octavo in size, though upwards of 500 pages in length) does credit externally to its parent and his office, for it is well and carefully printed, and nicely bound, illustrated, and got-up. Nor are we disposed to quarrel with the contents, regarding them to some extent as the work of an amateur. Such books are mistakes. A man's Life cannot be written as it should be, and ought not to be written at all, until he has been dead long enough to allow the exaggerations and false lights which surround us all—the least as well as the greatest—to fall off, and tone down. However, Mr. Robertson is only following the evil example of many of the metropolitan leaders in his own profession—who ought to know better—and has done the work he has set himself, if not with any great insight or power, yet at least without bad taste. There is nothing likely to annoy Mr. Bright or any of his family (unless it be the too frequent use of superlatives in the enthusiastic appreciation of his abilities and virtues); and, after all,

that is by far the most important quality in contemporary biography. It seems, indeed, superfluous, and quite out of keeping with Mr. Bright's character, to begin with a genealogical tree of the family, tracing it down in all its branches from Abraham Bright, a Wiltshire yeoman of Queen Anne's time. But such efforts seem to be thought a necessary part of the biographical business nowadays, and at any rate there is no ridiculous attempt to go back to any Sir Ralph, or Sir Roger Bright, of Plantagenet times.

The most interesting part of the book to our mind is the short portion which gives a sketch of Mr. Bright's boyhood and youth. It is meagre, and over-full of lists of names of good but unknown citizens who attended meetings or played matches in Lancashire nearly half-a-century ago, and of the subjects discussed by provincial debating societies. Still we learned from it a fact or two which we were glad to learn, such as John's loss of his first new suit of clothes, which his mother took off his back to give to a poor boy (p. 11); his ducking by his schoolfellows in a roadside pond for a trick he had played them (p. 34); his borrowing and riding Mr. Sladen's donkey; his fishings in the reservoirs to his father's mill (where we fear he might now angle for weary years without catching a stickleback); and his performances as a cricketer (p. 55). Mr. Robertson claims for him as a boy the habit of "exactitude, a quality which he has maintained through life," a position to which, with all our admiration for Mr. Bright, we cannot assent without qualification. His weak point seems to us to be the want of this quality, which leads to such protests as, for instance (to take the latest), those of the Bishop of Truro and Sir James Stephen.

His early career as a speaker, too, is interesting: how he rehearsed his speeches in the office of the mill to Nicholas Nuttall, a Radical workman; how at one of his first public performances (he and his friend Ormerod having agreed to prompt one another from their respective MSS. in case of need) John got "mixed," as his Yankee friends would say, in his peroration from having forgotten the name of the upastree, and had to turn round and ask, "What is next, Oliver?" amid shouts of laughter. But, if Mr. Robertson is to be trusted, the stories we have heard of his complete breaks-down as a speaker are all rubbish. He was evidently born with the great gift, and cultivated it most assiduously from boyhood.

From his entry into public life in 1838, when the Anti-Corn-Law League was formed, the book is merely a selection from and paraphrase of Mr. Bright's speeches, connected by the slightest possible chain of narrative. The selection is certainly made with some skill, and brought to our minds a number of incidents and good sayings which we had forgotten, and some which we had never heard before. At the same time, the story does not run easily, and is now and then forced and stilted. Take, for instance, this:—"As he stepped ashore he was heartily cheered by about 300 friends who had assembled on the quay,

" 'The observed of all observers,'

or, as Shakspeare elsewhere expresses it,

" 'Like a bright exhalation of the evening'"

(p. 343). This insertion of tags of poetry, with which the book would be far too highly salted even if they were all to the point and of good savour, is a decidedly weak point. Another, and more serious one to our mind, is the reprinting of electioneering speeches of the character of the one made at Rochdale in 1867, in which opponents are charged with "gorging" themselves with patronage, combining for the sake of "loot," &c. When Mr. Bright's Life comes to be seriously written his biographer will have to deal with much unnecessarily violent speech in his early years, but in such a book as this it was worse than useless to rake up such careless talk, slipping out in his ripe manhood. The short account of Mr. Bright's visit to Windsor on his taking office is as good in its way as Peter Pindar's account of the visit of George III. to "old Whitbread" at his brewery. But the one trifling incident which on the whole pleased us best, and made us close the book in high good humour, and with an assurance that the singular eminence of one member has had no deteriorating influence on the good old Quaker stock from which Mr. Bright springs, will be found at page 511. His eldest daughter took her firstborn, John Bright Clarke, to Birmingham to hear one of his grandfather's great speeches. When questioned afterwards what he thought of his grandfather's speech, young John answered that he liked the fight (which had come off between two men in the audience) much more than the talk. So long as the greatest orators do no more harm than this to their offspring, we shall bear with equanimity almost any amount of dishing-up of their eloquence with trimmings of laudatory comment in their lifetime.

THOS. HUGHES.

NEW NOVELS.

Mirage. By George Fleming, Author of "A Nile Novel." In Three Volumes. (London: Macmillan & Co., 1877.)

False or True, and Three other Tales. By Alice de Thoren. (London: Remington & Co., 1877.)

If. A Novel. By the Author of "Casque and Cow," &c. In Three Volumes. (London: Tinsley Brothers, 1877.)

The Earl of Effingham. A Novel. By Lalla McDowell. (London: Samuel Tinsley & Co., 1877.)

Two Knaves and a Queen. By Frank Barrett, Author of "Fantoccini," &c. In Three Volumes. (London: Tinsley Brothers, 1877.)

THE merits of *A Nile Novel* led us to look forward with more than ordinary interest to a second story from the same pen, but we cannot help saying that we are disappointed in *Mirage*. The characters are weaker, and the book too long. There is certainly the same excellent style; and the same accurate and realistic sketches of scenery and places seem almost to carry us away into Eastern lands, but the general interest is not well sustained. The plot of *Mirage* is very similar to that of *A Nile Novel*. A young lady goes on a tour with her friends in Palestine and

Syria. She has two lovers, one travelling with her party, the other for the most part absent. As before, the one present proves successful. The other, by name Denis Lawrence, vanishes into lands still further east, and returns, some years later, to startle the London world with his paintings. One of these is kept private, but a particular friend is told that if it is ever exhibited it will be called *Mirage*. It is his recollection of the heroine of the story, by name Miss Constance Varley, afterwards Mrs. Jack Stuart. The author is much more successful in depicting female than male characters. This is especially noticeable in this second novel. Also the wit seems to be occasionally forced, and jokes are pulled in head-and-shoulders-wise. Although the travellers in *Mirage* are not, apparently, connected with our former friends on the Nile, there appears at Damascus Belle Hamlyn's unsuccessful lover, George Ferris. He seems to have got over his disappointment at Cairo, and has now devoted himself entirely to art. We are glad that he has found this consolation, for we felt great sympathy with him in his trouble.

It is difficult to imagine what benefit could accrue to Miss de Thoren or to the novel-reading community from the publication in a volume of the four slight stories, the first of which is called "False or True." This is the most elaborate as regards plot, and something better might have been made of it. But how can a stray couple march into a country church and be married, just as the clergyman is taking off his *surplus* (*sic*) after morning service? The difficulty of the ring might have been got over, but scarcely the absence of a licence or the publication of banns. The last story, which is entitled "Mimi," is sad, and rather pretty.

The hero of *If* is an unsuccessful painter, the heroine a successful musician. The latter "elopes with Art," and the former with a young lady at about the same time. There is an egregious villain in the story, who is the main cause of the ill success of the hero's repeated attempts to reinstate himself in the position which he had lost by his imprudent marriage. This amiable being, by name Count Luis Rinalzi, also endeavours to ruin everybody else's happiness, but at length dies picturesquely. His decease paves the way for the rescue of Horace Raleigh from the lowest depths of poverty and misery. His wife has been some time dead, and he is found dying. Whether he recovers to marry Hermia Stuart, the accomplished musician, we are not told. The story breaks off in the midst of a musical *soirée*, given by Miss Stuart. The music begins, and the minds of all present are enthralled. Only the heart of the player is far away, by the bedside of the man she had loved throughout her life—the poor sick artist. The book is artistic and pleasing, and the sketches of the Greville and Stuart families form a good background to the principal figures.

The Earl of Effingham is a thoroughly good tale. It is written with the intention of showing the evils that result from absentee landlords in Ireland, and the good which they might work by living at home. Miss McDowell quite carries her readers

with her in descriptions of people or places, and her heroine is a charming study of an Irish girl. The only mistake in the book is the inaccuracy of calling the younger son of an earl the Honourable Major Effingham, and his elder brother Lord Stanley Effingham.

The story of *Two Knaves and a Queen* illustrates not inaptly the playing of the cards of an important trick in whist. The stakes are the great Biron property. The hero and heroine, Hugh and René Biron, are partners against the two knaves, who are, however, but hollow-hearted confederates, each desirous of obtaining the lead. Hearts are trumps. Mr. Fox plays the first card, the knave of diamonds, by gaining the ascendancy over old Mr. Biron, and causing his grandson's disinheritance. René Biron, a newly-found grandchild, next plays the queen of the same suit, and ousts Mr. Fox from favour. Her former protector, M. Gaillefontaine, thinks now to win both lady and property, and trumps with the knave of hearts. The game seems in his favour, when the formerly disinherited grandson, Hugh, overtrumps with his king, and wins the trick, the property, and—his cousin. The story is fairly told, and the characters are well brought out. One or two scenes are, nevertheless, rather overdrawn, as also, we think, is the utter disregard of the heroine for English customs and conventionalities. T. W. CRAWLEY.

SCHOOL-BOOKS.

Le Théâtre français du XIX^{me} Siècle (Dulau and Co.; Hachette and Co.) is a well-selected series of modern French plays. Perhaps it will be most useful to teachers if we say a few words about the story of each of the plays. Even those who share our opinions about the editing will be glad to have the dramas themselves in a cheap and handy form. Victor Hugo's *Hernani* (edited by Gustave Masson) is by many considered his masterpiece. It is an episode of the beginning of Charles V.'s reign. Charles and the robber-chief Hernani, the exiled head of one of the great Spanish houses, are enamoured of Doña Sol, who is betrothed to her uncle and guardian, Don Ruy Gomez. The chivalry of the old Castilian noble, who protects his rival at all hazards against the king; the magnificent soliloquy of Charles in the tomb of Charlemagne; and the tragic end, where on his wedding-night Ruy Gomez exacts of Hernani the fulfilment of the pledge that had placed his rival's life in his hand—will at once recur to all who have read the play. Perhaps it is in places a little too passionate to interest schoolboys, who would take more kindly to *Les Burgraves*. Delavigne's *Les Enfants d'Edouard* (edited by F. Tarver) tells the story of the young princes murdered in the Tower. It is hardly a work of genius, but by no means uninteresting. Like *Hernani*, it is in verse, as is also Lebrun's *Marie Stuart* (edited by H. Lallemand), a free adaptation of Schiller's celebrated play. Bouilly's *L'Abbé de l'Épée* (edited by V. Kastner), an historical comedy in prose, is based upon an incident in the life of the philanthropist who in the eighteenth century devoted himself to the instruction of the deaf and dumb. *Michel Perrin*, by Mélesville and Duveyrier (edited by Gustave Masson), is a light comedy, interspersed with songs, referring to the early days of the Consulate. Michel Perrin, a disestablished parish-priest, who had been brought up with Fouché, Napoleon's Minister of Police, applies to his old friend for employment. By a misunderstanding, he is placed in the secret police, inadvertently discovers and reveals an im-

portant plot, and when he finds out what he has done, lectures the conspirators and dismisses them through the back door of the bureau. The signature of the Concordat relieves him of his uncongenial employment, and restores him to his flock. *Mdlle. de la Seiglière*, by Jules Sandeau (edited by H. J. V. de Candolle), is a story of the Restoration, turning on the love between the daughter of a returned émigré and the son of his steward, who had generously reinstated his former master in his ancestral estates. Of the notes to the series there is not much to be said. Except where allusions are explained they consist for the most part of mere translations of idioms which could be equally well found in the dictionary. There is no trace of an attempt to set boys thinking how such phrases came to have their meaning.

Selections from Alfred de Musset, edited by Gustave Masson (Hachette and Co.), is disfigured by the same unnecessary translations of phrases like *à tout prendre, de quoi il s'agissait, comme d'habitude*. But among these useless notes we find a good many quotations and illustrative criticisms which only extensive literary knowledge could have supplied. The selection consists of two *proverbes*, "On ne saurait penser à tout," and "Il faut qu'une porte soit ouverte ou fermée," two novelettes, *Croisilles* and *Pierre et Camille*, and a selection of poems, including "La Nuit de Mai," "La Nuit de Décembre," the verses on Malibran, &c. Of course the selections are such as may be read in schools. In the same series appears Ponsard's *Le Lion Amoureux*, edited by H. J. V. de Candolle. The scene is in Paris, just after the Revolution of Thermidor, and the hero is General Humbert, a self-made Republican soldier, who finds his way into Mme. Tallien's salon, and eventually marries a Marquise. There is a carefully-compiled index of proper names, but the ordinary notes are of the same indifferent type as those of the series mentioned above.

Outlines of French Literature, by G. Masson (Dulau and Co.; Hachette and Co.), in a primer form, is another example of M. Masson's remarkable fertility, which seems, however, to be often incompatible with first-rate work. We have lately had more than one opportunity of seeing that a primer of literature may be itself delightful reading, but we scarcely say as much of this work. It is far too crowded with names, and tells us far too little of the names for which we care most. Of La Fontaine, for instance, we hear that he was of the same school as Molière, that his fables are little dramas, and that it is a pity his "Contes" are not proper. Racine, we learn, is admirable in the representation of love, but inferior in moral greatness to Corneille. But that is all. Nor do Molière, Pascal, Corneille fare much better. Again, there is some ground for deprecating, in a primer of literature, such phrases as "repudiating the errors of Positivism," "an attempt to reconstruct the edifice of human knowledge on the quicksand of infidelity."

Brachet's Elementary French Grammar, adapted by Brette and Masson (Hachette and Co.), is a republication in two small volumes of the *Public School French Grammar*, reviewed in the ACADEMY of September 9, 1876. It is a considerable improvement on that work in point of clearness and adaptation to the wants of teachers. A good deal of pains has been taken to bring out important words by variety of type, and the book is well provided with index and vocabularies. But the Syntax will bear no comparison with that of the standard German school-book, Dr. Plötz's *Schul-Grammatik*. The subjunctive, the idiomatic uses of the tenses, and the employment of *de* and *à* are far from adequately treated. Other parts—as, for example, the pronouns—are better done.

A First French Book, by Henri Bué (Hachette and Co.), is a useful little compilation, but seems to us to go on too fast. At least twice as many

exercises are wanted in proportion to the text. Nor do we like, in the first dozen pages of a book for children, to encounter such phrases as "comparative of inferiority," and "absolute superlative." Cogery's *Philological French Primer* (Relfe Brothers) is simply a vocabulary and conversation-book. The chief object is to supply a large stock of nouns arranged in groups according to termination and gender. Why it should be called philological does not appear. F. Julien's *Petites Leçons de Conversation et de Grammaire* claims to be, not a grammar, but a method of conversational French. Indeed, the author is so enamoured of the idea that the main object of studying French is to use it conversationally that he says in so many words that unless one can speak French it is of no use whatever to read a French book as fluently as an English one. The book, however, does well what it professes to do; the exercises are numerous and lively, and there are some good hints how to make the most of them by basing a little conversation on each sentence. It is a good idea, too, to begin with a number of phrases like *debout, levez les bras, &c.*, which the author calls "drill," so as to habituate a child to hear some French spoken from the very commencement.

We have received several parts of *Nafel's German Series* (Longmans and Co.)—namely, the First Reader, the First and Second Exercise-Book and a book of prose composition. In the last-named the notes are of the most commonplace description, and no real effort is made to initiate a pupil into German style.

German-English and English-German Dictionary, by W. D. Whitney. (Macmillan and Co.) The English-German part of this dictionary seems very carelessly put together. The first two words to which we turned were *in* and *lay*. Under the word *in* we have the following list—*in* (*innerhalb, binnin*), *auf, an; bei, nach, zu; darein, darin, drinnen; ein, herein, hinein; dabei, daran*—then some thirty phrases, taken apparently at random, with no attempt at classification. Among these phrases are, *to gaze in wonder, vor Verwunderung starren*, which is much too strong; *in respect to you, aus Achtung für Sie*, where the English is quite misunderstood; *to come in, hinein-kommen*, which shows ignorance of the use of *hin* and *her*; *inasmuch, insofern*, which generally means *inasmuch as*; *in comparison, in Vergleich*, instead of *im Vergleich*; *in arms, unter den Waffen*, which would much more often be rendered "under arms," and no mention of a baby in arms; *in my mind, meiner Meinung nach*, which means "in my opinion," "in my mind" being hardly an English expression. Again, take the verb *to lay*. The article begins with seventeen German verbs, divided into groups by semicolons; but with no further indication of their meaning. Among them are *beschuldigen* and *zurechnen*, which could under no possible circumstances render the English word "lay." Probably the compiler was thinking of the phrase "lay to the charge of." In the middle of phrases of which the verb "to lay" forms part appears suddenly *my way lay just by him*, which most editors would place under another heading; and soon after the extraordinary expression *to lay in for*, which, judging by its German equivalent, must be a new form of *to lie in wait for*. The German-English part is much more satisfactory. It contains derivations, and indicates by a particular type such corresponding forms as *Mitleid, compassion; annehmen, accept*. Of course the work lays no claim to completeness, but the selection is judicious. One retrenchment might be recommended—the omission of the tenses of strong verbs like *sprach, gesprochen*, from the general dictionary; it is quite enough to give them in the list of irregular verbs.

NOTES AND NEWS.

SIGNOR GIUSEPPE MASSARI is to write a biography of General Lamarmora, which will be published by Messrs. Barbèra.

A NEW volume of poems is expected at no distant day from Prof. Nichol's pen.

WE are glad to notice a handy reprint of the well-known *History of the Peace* (George Bell and Sons), which, though the greater part of the first book was the work of Mr. Charles Knight, always bears the name of Miss Harriet Martineau, the author of by far the larger portion of the book.

WE regret to learn the death of Mr. Joachim Monteiro, the author of the excellent work on Angola, the Portuguese settlement on the Congo. Mr. Monteiro has recently resided at Delagoa Bay, where he was settled in connexion with a railway to the Transvaal, and where his death occurred.

FATHER SBOCHI's work on the Sun, translated by Mr. R. A. Proctor, is preparing for publication by Messrs. Longmans.

WE understand that Mr. J. S. Reid, Assistant-Tutor and late Fellow of Christ's College, Cambridge, whose critical edition of Cicero's *Academica* was published by Messrs. Macmillan and Co. in 1874, has prepared a translation of that work which will shortly be published by the same firm.

MESSRS. HURST AND BLACKETT have in the press a work called *A Legacy: being the Life and Remains of John Martin, Schoolmaster and Poet*, written and edited by the author of "John Halifax," in two volumes. The work will describe, we are told, the incidents of a very touching and interesting life.

Viva is the title of Mrs. Forrester's new novel which is shortly to be issued by Messrs. Hurst and Blackett.

MESSRS. MACMILLAN AND Co. will shortly publish a work entitled *Money and Value*, by Mr. Rowland Hamilton. The author's aim has been to explain the use of money and of credit in the system of industry, believing that the best remedy for its perversions is to be found in a better knowledge of the nature of the work essentially required for beneficial production.

It is said that Mr. Robert Buchanan has left the *Contemporary Review*, and is about to establish under his own editorship a new weekly critical journal.

MESSRS. GRIFFITH AND FARRAN are preparing for publication new and thoroughly revised editions of *Memorable Battles in English History*, by W. H. Davenport Adams, and of *Ocean and her Rulers*, by Alfred Elwes.

THE Rev. Samuel Beal, Professor of Chinese in University College, London, will deliver two lectures in the College, at 3 P.M., on April 2 and 4.

WE understand that Mr. C. S. Jerram, late Scholar of Trinity College, Oxford, is engaged upon an edition of the *Tabula* of Cebes, the Theban philosopher, with Introduction and Notes. This work, which was once popular as a school-book, has been long neglected, and no edition has appeared in this country for more than a century. It will be published by Messrs. Macmillan and Co. on behalf of the Delegates of the Clarendon Press.

MESSRS. ALLEN AND Co. are about to publish a work on the Armies of the Powers of Europe, giving particulars of their strength and organisation, and many interesting details regarding famous regiments in the different services, their constitution, &c., &c. The book will also include an account of the Navies of the several Powers.

MESSRS. RIVINGTONS have in the press two volumes of the late Canon Mozley's *Essays, Historical and Theological*, contributed to various *Reviews*, &c.; also a volume containing a course of *Sermons for the Christian Year*, selected from

the Rev. John Henry Newman's eight volumes of *Parochial and Plain Sermons*, by the Rev. W. J. Copeland.

MR. JOHN E. BAILEY, F.S.A., has just printed a lecture dealing with the history of Stretford, one of the many villages now forming the suburbs of Manchester. The booklet forms a model of what a local history should be. Stretford has not been distinguished by any very notable events, nor is it remarkable as the birthplace of any worthies of the first class. Yet the pamphlet is one of considerable interest, and shows Mr. Bailey's well-known industry and accurate research. Thomas Walker, the author of *The Original*, by his reform in the management of the poor, reduced the poor-rates by one-half, and emptied the workhouse. In 1581 the curate of Stretford was "presented" for keeping an ale-house.

A NEW weekly journal, entitled *The Athletic World*, which will be devoted solely to cricket, football, bicycling, rowing, and athletic sports, is announced to appear on April 4, 1878. It will be published by E. W. Allen, 11 Ave Maria Lane.

THE annual general meeting of the Booksellers' Provident Institution will be held on Thursday, March 14, at their committee room, 60 Old Bailey. The President (John Murray, Esq.), is expected to take the chair at seven o'clock. Subscriptions and donations to be announced at the meeting may be sent to the Secretary, Mr. Ives, Amen Corner, Paternoster Row, any time before that date.

WE hear from Lahore that Dr. Leitner has published the second volume of his history of Mohammedanism written in Urdu. The same laborious scholar has also brought out a new edition of his *Dardistan*. The University College at Lahore, which owes its existence chiefly to the exertions of Dr. Leitner, is to become a university with the power of granting degrees.

A PRIZE has been offered at Frankfurt for the best essay on the systems of philosophy of Schopenhauer, Geiger, and Noiré.

THE widow of Chavée, the author of the *Lexicologie indo-européenne* and other works on Comparative Philology, whose death took place at Paris last year, has published a posthumous work, *Idéologie Lexicologique*, which contains also a short autobiography of her husband. Chavée began life as an ecclesiastic, and was perhaps the last who attempted to prove the derivation of all languages from Hebrew. He afterwards became a pupil of Burnouf, and by his lectures at Brussels, Pisa, and Paris, rendered useful service to the cause of Comparative Philology. In his attempt at reconstructing a typical Aryan language, he anticipated the method adopted by Schleicher and his school.

THE third and concluding volume of Spiegel's *Iranische Alterthumskunde*, a work worthy to stand by the side of Lassen's great work *Indische Alterthumskunde*, has appeared. Besides concluding the Eranian history, it describes the political and family life, and the state of knowledge and art. In a lucid chapter the author gives his results as to the origin and date of our text of the Avesta.

NUMEROUS German tributes have been given to Mr. Sime's *Life of Lessing*. Dr. Schöne, the editor of *Lessing's Letters to his Wife*, reviewed it in a long article of seventeen pages in *Im Neuen Reich*; and Karl Grün has given four articles on it in *Beilage zur Allgemeinen Zeitung*. The latter praises Mr. Sime for his comprehension of Lessing's purposes, his sense of proportion, and clearness in philosophic interpretation.

THE *Rassegna Settimanale* announces that the widow of Carlo Troia has presented to the National Library of Naples a number of MSS. of the late Neapolitan historian, including all the notes, letters, and documents, which he used for his *Storia d'Italia del medio Evo*, and his *Vetro di Dante*;

his correspondence from 1821 to 1849; and his commonplace book.

AMONG the black-letter fragments of Mr. W. B. Scott, Mr. Edmund Gosse has found two more leaves of the *Cruel Dettor*, by H. W. Wager, whose "Longer thou liuest" is so well known for the bits of old ballads it contains. This "ballet or interlude of the *Cruel Dettor*" was licensed to Thomas Colwell in the year July 1565 to July 1566 (see *Arber's Transcript*, i., 138), and has been hitherto known only by a single leaf among old Bagford's collection of title-pages, cuts, and scraps, in the British Museum. The *Cruel Dettor* is partly in seven-line stanzas, like *Calisto and Melibœa*, in Hazlitt's *Dodsley*, i., 53, great part of Bale's *God's Promises*, (1538, Hazlitt, i., 285), and other plays of the time, from which Shakspeare may have taken his fashion of stanzas, alternates, couplets, four-measure, and other doggerel in *Love's Labour's Lost*.

THE Museum of the Louvre has just acquired a copy of the *Book of the Dead*, which bears the name of a princess named Nedjem, mother of Her-hor, the high priest of Ammon, who usurped the royal power at the close of the dynasty of the Ramses, the fifteenth dynasty of Manetho. This large and important papyrus, which is in admirable condition, will be on exhibition very shortly in the Egyptian Museum at the Louvre.

THE death is announced of M. de la Saussaye, author of several remarkable Memoirs on the antiquities of La Sologne; and of a work on *La Numismatique de la Gaule narbonnaise*.

IN the *Revue Critique* for March 2, M. Joret has published a letter from Queen Christina of Sweden to M. Tesson, speaking of preparations made for the extirpation of heresy in France. She speaks out boldly, all Catholic as she was, as becomes the daughter of the great Gustavus:—

"Je vous avouerai franchement," she writes, "que je ne suis pas fort persuadée du succès de ce grand dessein, et que je ne saurais m'en réjouir comme d'une chose avantageuse à notre sainte religion: au contraire je prévois bien des préjudices qu'un procédé si nouveau fera naître par tout. . . . Les gens de guerre sont d'étranges Apôtres, je les crois plus propres à tuer violer et voler qu'à persuader. . . . Je plains ces malheureux d'être nés dans l'erreur; mais il me semble qu'ils en sont plus dignes de pitié que de haine; et comme je ne voudrais pas pour l'empire du monde avoir part à leur erreur, je ne voudrais pas non plus être cause de leur malheur."

In his recently-published volumes Prof. Masson expresses his surprise that Milton should have thought Christina worthy of the high-flown eulogium which he bestowed upon her. If Milton had lived to know how the Queen could express herself on the Dragoonades, he might easily have replied that he had detected her true greatness beneath the superficial extravagances of her conduct.

THE *Archiv für pathologische Anatomie und Physiologie* has just begun its seventieth volume. The first article in it, "On the Standpoints of Scientific Medicine," is from the pen of Prof. Virchow, who has been a contributor to the journal for the last thirty years. "Just thirty years ago," he says, "I wrote the first article for this journal on exactly the same subject," and he then develops his idea of what the method and aims of medicine ought to be at present. Besides many important views of a purely professional character, the paper contains the following statement on the problem of evolution and its true relation to pathology:—

"It is the same blind passion for imitation and systematising which in the last few years has borne such terrible fruits in the 'bubble companies' of speculators. Because one manufactory for railway goods was in a flourishing state, ten were at once founded, without remembering that the same demand did not require a tenfold supply. Because one or other contagious disease is contracted through Bacteria, therefore all contagion must at once be of a Bacterian origin. Nothing has operated more mis-

chievously in this direction than the crude systematizing of the Darwinians. It is true that for us who had known the old natural philosophy it was a great surprise to see how by the genius of one man a thought which had already been accepted as an *a priori* necessity by natural philosophers was, after long and, unfortunately, not altogether unmerited banishment, enabled to reassert its rights, and was not merely revived, but made the foundation of a general system of the development of the organic world. But to turn a problem into an article of faith, to make a motive for investigation into a principle of synthesis, and, instead of examining, to revel in suppositions, is almost more dangerous than the *a priori* reasoning of the old philosophy of nature; for even the firm facts which had been established in the mean time were crammed into the new system, and ran the risk in this connexion, under the appearance of hypotheses, of losing their real significance. The 'struggle for existence' seemed to many people to be something quite new and unheard-of, as if the doctrine of self-preservation and of the instinct of self-preservation had not been the foundation of biology from time immemorial. Even the doctrine of hereditary transmission, this so patent fact of pathological experience, dazzled in its new form many eyes, but little used to the light of true science, and the attempt to consider pathological inheritance from a perfectly new point of view led many neophytes in our science to a lavish expenditure of learning, to which, strange to say, the archives of pathology were hardly called on to contribute. I need not here remind you that I belong to those who did not need this new incitement to consider the variability of species as a necessary condition for the mechanical theory of life. In a speech on the mechanical conception of life which I delivered before the Congress of Naturalists at Carlsruhe in the year 1858—a year before the publication of the first edition of Darwin's *Origin of Species*—I stated this in the most decided manner (*Four Speeches on Life and Sickness*, Berlin, 1862). I had already, in the year 1848, laid no less stress on the mechanical origin of life from general motion, as a logical necessity. (See *Efforts for Unity in Scientific Medicine*, Berlin, 1849.) I was therefore from the first prepared to accept gladly each fact which could establish the variability of species or original generation, and to value it as an important gain. But I cannot forbear, on the ground of my own experience, from warning you solemnly against the danger of taking hypotheses for facts, and of forgetting in the facility of general explanations, the necessity of authentic proofs for every single case."

On February 21 the University of Leipzig celebrated the fiftieth anniversary of the day on which W. Dindorf took his degree of M.A. The old Saxon University still retains the title of *Magister artium*, which at most of the other German universities has been replaced by *Philosophiae Doctor*. The University sent Dindorf a new diploma, in which he was addressed as—

"Qui cum scriptorum Graecorum permultorum, quorum in numero poetae scenici et Demosthenes orator principem locum tenent, operibus et scholiis, quae in Homeri Iliadem, in Aeschyli, Sophoclis, Euripidis tragoediis, in Aristophanis comoediis, in Demosthenis et Aeschinis orationibus ab Alexandrinis et Byzantinis grammaticis conscriptae sunt, reliquiis accurate edendis, ingeniose emendandis, erudite interpretandis, tum Graecae linguae thesauro locupletissimo quem Henricus Stephanus olim construxit augendo, corrigendo, melius digerendo tantum artis criticae usum tantumque sermonis graeci peritiam probavit, ut non solum de Graecae linguae graecarumque literarum studiis promovendis insigniter meritus sit, sed etiam eis qui artis criticae et grammaticae hoc saeculo principes fuerunt, iure optimo adnumeretur."

Dindorf, as a classical scholar, is, no doubt, the most celebrated pupil of whom the University of Leipzig can boast during the present century. Deputations and letters of congratulation came from all parts of the world. The University of Oxford, for which Dindorf has brought out some of his most celebrated editions, was not represented.

OBITUARY.

THE Rev. C. Lesingham Smith died on the 23rd ultimo, aged seventy-one. He was educated at Christ's College, Cambridge, being fifth Wrangler in the mathematical tripos of 1829. In the following year he was elected to a fellowship, which he retained until he was appointed in 1839 to the college living of Little Canfield, and during several years he held the post of Mathematical Lecturer in his college. The long vacations of 1835 and 1836 were spent in exploring some of the wildest districts in Scotland. The journal of his tour in 1835 was printed at the desire of his friends for private circulation, and was reprinted with the subsequent journal of 1836 for public use in 1837. His poetic tastes induced him in 1842 to print a volume of original *Odes and Sonnets*, combined with translations from ancient authors, and a poetic version in the metre of the original of the first canto of Tasso's *Jerusalem Delivered*. The successful translation of one canto led him to attempt a version of the whole poem in the same metre. It was printed in 1851, and again in 1876. In 1870 he returned to the field of original poetry with a volume of *Home Recollections and Village Scenes*, the product of a cultivated mind and considerable poetic talent. So long as health permitted he was the warm supporter of every movement for the benefit of his parishioners.

NOTES OF TRAVEL.

As a fifty-third supplementary part of his *Mittheilungen* Dr. Petermann has published a translation of Colonel Przevalsky's official report of his journey from Kulja across the Thian Shan to the Lob-nor and the Altyn-tagh, made in 1876-77, with its accompanying maps. In a preface the editor characterises this journey as the crowning one of all former explorations in Inner Asia. It joins our modern routes of exploration with those of Marco Polo of 600 years ago, and marks a line of knowledge through the hitherto most unknown region of the continent. Before its accomplishment all the great basin of the Lob-nor, surrounded by the highest mountains in the world, remained completely unexplored by any educated traveller. In this respect Przevalsky's journey ranks with such famous exploits as the first crossing of Australia, the discovery of the Nile sources, or the tracing of the Congo. The report in itself has an interest for almost every branch of natural science.

ANOTHER important publication of the Egyptian General Staff—a *Report on the Province of Kordofan*, by Major H. Prout (Cairo, 1877)—has newly reached this country. The information it contains is systematically arranged under the heads of Geographical Limits, Topography, Inhabitants, Soil and Water Supply, and Climate. A number of special route-maps and a general map of the province are appended: the former are generally distinct and well-executed; but the latter has been very badly lithographed. All, however, have the great value of originality; they are from independent surveys, and rest on the basis of freshly-determined astronomical positions.

A CHARMING little *Visitors' Guide to Cannes and its Vicinity*, by F. M. S., with map and tables, has been issued by Mr. Stanford, of Charing Cross. Its author writes evidently from the most intimate knowledge of this winter resort, made famous by Lord Brougham, and has contrived to give his work a very many-sided interest. Here is one little fact, for example, that will interest smokers generally—that most of their briar-root pipes are from this neighbourhood:—

"The mountains round about [Cannes] are covered with a thick underwood of tall heath, the *Erica mediterranea*. This is grubbed up for the sake of the roots, which are brought down to saw-mills, of which there are several in the district. There, by steam machinery, the roots are cut roughly into shape, then boiled, dried, and otherwise prepared, and sent off to

Paris and other large towns, to be turned into neat pipes and fitted with amber mouth-pieces. The word 'briar' in the name is merely a corruption of *bruyère*, the French for heath."

WE regret to hear that the General Missionary Committee of the United Free Methodist Churches have refused to allow the Rev. Thos. Wakefield, the well-known African missionary and traveller, who is just now in the Galla country, to undertake an expedition in the neighbourhood of Victoria Nyanza on behalf of the African Exploration Fund. This is the more to be regretted, as Mr. Wakefield is on the spot, and is eminently well qualified for the work, which, we believe, he was personally quite ready to undertake.

M. RAFFRAY, who has for some time been engaged in making investigations into the natural history of the northern portion of New Guinea, has returned to Paris, bringing with him some interesting and valuable collections. In the course of his labours M. Raffray has visited the Arfak tribes in the Dori-Andai peninsula, and has studied the manners and customs of the Papuans at Amberbaki, in the interior, and in several islands of the Misori group.

MAGAZINES AND REVIEWS.

MR. TENNYSON's stirring ballad, with which the *Nineteenth Century* opens, is an instance of how little alteration is required at the hands of a great poet to make Elizabethan prose into modern poetry. "The Revenge: a Ballad of the Fleet," is, as we all know, a poem on that unexampled battle which was fought by Sir Richard Grenville against the Spanish navy in 1590, and which many contemporary writers forthwith celebrated in prose and verse. Mr. Arber, in his invaluable series of reprints, has given us the versions of Sir W. Raleigh, of Gervase Markham (in verse), and of J. H. Linschoten, a Dutchman in the Spanish service; and with this reprint at hand it is as easy as it is interesting to compare the originals with the modern rendering. Gervase Markham's is perhaps one of the worst poems that ever was written, though, as Mr. Arber says, "it does certainly help us to realise the long duration of the fight;" it is Euphuism run mad, and it takes eighteen pages to describe, not the battle, but the discussion between Grenville and Middleton as to whether there shall be a battle at all! The Poet-Laureate's opening is one that remains with any one who has once read it:—

"At Flores in the Azores Sir Richard Grenville lay,
And a pinnace, like a flutter'd bird, came flying
from far away."

The pinnace is from Markham, for Raleigh describes Middleton, who brought the news, as being "in a verie good sailer." Here is Markham's account of the scene—a scene, it will be remembered, of hurry and stir, where not a moment is to be lost if Lord Thomas Howard's few ships are to get away safely:—

"In that same myd-daies hower came sayling in
A thought-swift-flying Pynnase, taught by winde,
T' outstrip in flight Time's euer-flying wing;
And being come where Vertue was inshrind,
First vail'd his plumes, and wheeling in a ring,
With Goat-like dauncing, stays where Grinuile
shynd,

The wylie his great Commander calls the name
VWhich is ador'd of all that speakes the same."

The "adored name" is of course Grenville, of whom Linschoten speaks thus:—"He was a man very unquiet in his minde, and greatly affected to warre; . . . and was greatly feared and hated in these Islands, and knowne of euery man, but of nature very seuer, so that his own people hated him for his fiercenes, and spake very hardly of him." Mr. Tennyson, however, in the general course of his poem, follows neither Markham nor Linschoten, but almost entirely Raleigh; though with a fine instinct he has taken from Markham's poem the one or two vivid

touches by which its weary pages are lightened—e.g., "Sink we the ship, Master Gunner—sink her, split her in twain!" How close he keeps to Raleigh, generally speaking, may be seen from comparing such passages as the following:—

"In the meane while . . . the great *San Philip* being in the winde of him, and comming towards him, becalmed his sailes in such sort as the ship could neither way nor feele the helme; so huge and high eargd was the Spanish ship, being of a thousand and five hundred tuns. Who afterlaid the *Revenge* aboard. . . . After the *Revenge* was intangled with this Philip, foure other boarded her; two on her larboard, and two on her starboard. The fight thus beginning at three of the clocke in the afternoone, continued verie terrible all that evening. But the great *San Philip* having receyved the lower tire of the *Revenge*, discharged with crossebarshot, shifted herself with all diligence from her sides, utterly mistiking her first entertainment."

"Thousands of their soldiers look'd down from their decks and laugh'd,
Thousands of their seamen made mock at the mad little craft,
Running on and on, till delay'd
By their mountaine-like *San Philip*, that, of fifteen hundred tons,
And up-shadowing high above us with her yawning tiers of guns,
Took the breath from our sails and we stay'd.
And while now the great *San Philip* hung above us like a cloud
Whence the thunderbolt will fall
Long and loud,
Four galleons drew away
From the Spanish fleet that day,
And two upon the larboard and two upon the star-board lay,
And the battle-thunder broke from them all.
But anon the great *San Philip*, she bethought herself and went,
Having that within her womb that had left her ill-content."

We doubt whether a better lesson in the art of poetical construction could be got anywhere than from a minute comparison of these two writings, the work, each of them, of a master of style.

The other articles in this number of the *Nineteenth Century* are mostly political, and distinguished as are the names they bear, it is not our business to notice them. The *Fortnightly* has also its fair share of political papers; but it contains besides two literary articles and Mr. Matthew Arnold's Royal Institution Lecture on "Equality." This lecture, which made such an impression on those who heard it, will scarcely make less impression on those who read it, though it may seem to some to be too much like the voice of one crying in the wilderness. It would seem as though Mr. Arnold, having published his "complete" poems, and his "last essays" on religion, was now turning himself definitely to work out in the direction of practical politics the doctrines of which the outlines were laid down in *Culture and Anarchy*, and the religious determination of which was shown in *Literature and Dogma*. What the next step may be we cannot tell, but a theoretical demonstration of the beauty of social equality, and a practical exhortation to think over the laws of bequest and entail, is a good beginning. Mr. Arnold's text is that fragment of Menander, less well known than the other fragment about evil communications, "choose equality and flee greed"—*ισότητα δ' αἰεὶ καὶ πλεονέξιν φύγε*. Here is the opinion of a consummate critic of life, and of one whose parallel maxim, taken up by St. Paul, has become a commonplace of Christian morals. And yet, on the other hand, we have Lord Beaconsfield holding equality up to the reprobation of the Glasgow students, Mr. Froude doing the same to those of Edinburgh, and Mr. Lowe and Mr. Gladstone, in the midst of their passage of arms about the franchise, uniting to shower blows on "equality, poor thing." To decide between Menander and modern English opinion we must look outside, to contemporary Europe, and ask what practical regulations,

embodied in law, tend in each country to promote equality or inequality. There is no difficulty in showing that not only in France, but in all the countries "where the community has a will of its own, Holland, Belgium, Switzerland, Italy, the state of the law of bequest is such as to produce equality." The same is our conclusion if we look to America and the English colonies, so that "the practical revolt against inequality, amongst so many people not so very much unlike ourselves," becomes a notable phenomenon and one that tempts us to investigate the matter a little further. We need not quarrel about first principles, says Mr. Arnold, for he at least will not advocate equality on the basis of natural right. "It cannot be too often repeated—peasants and workmen have no natural rights, not one. Only we ought instantly to add that kings and nobles have none either. . . . The question is one of expediency." It is in the tests of expediency which Mr. Arnold offers that he is most truly himself, and that he returns to the old lines which his writings of the last ten years have made so familiar. What, after all, ought a society to aim at—what kind of excellence? Not one kind alone; for perfection has for its factors many powers—the power of conduct, of beauty, of knowledge, of social life and manners. Now England, it will be admitted, in its devotion to conduct, has left the other "powers," or factors, of perfection too much out of sight, and hence its proverbial failure, as a nation, in all those lines. How if it can be proved that France, when her upper classes had once established a high standard of manners and social life, has been able to extend that standard by her legislation in favour of equality, just as the same legislation has made of her and of Belgium the countries where material well-being is most widely spread? How if it can be proved that the joy of life in France, the moral as well as physical *bien-être*, is directly traceable to social equality, while her "fearful troubles," of which Sir Erskine May says so much, are as directly traceable to her neglect of those other factors of perfection—notably the factor of conduct—which all will admit to be still more important than the factor of social life and manners? How if, conversely, the English national vices, which drag us down so low, "materialising our upper class, vulgarising our middle class, brutalising our lower class," are as directly traceable to the rules by which, long after its political *raison d'être* is gone, we keep up the inequalities that have been bequeathed to us by the Middle Ages? . . . We will not follow Mr. Arnold through his demonstration of all this. All who read it will recognise its importance, its force, will agree that "it is a matter for the thoughts of those who think," and that the more people are set to think about it the better.

THE *Fortnightly* contains also a good paper on Lessing, by Mr. R. W. Macan, damaged a little perhaps, by the writer's ultra-Teutonic sympathies, but still a solid piece of work. Mr. Saintsbury's article on Théophile Gautier, in the same Review, is a more important piece of writing than either of his two former essays on Sandeau or Cherbuliez, perhaps because Gautier is a more important and inspiring subject. The Sandeau paper, at any rate, struck us as rather too ordinary in style and execution to satisfy the canons laid down by Mr. Saintsbury himself in the *Fortnightly* some time ago. The present paper, however, contains some extremely delicate and finely written criticism, a little "Corinthian" at times, sinning every now and then in the direction of "glitter without warmth, rapidity without care, effectiveness without charm," but, in the main, worth reading and worth writing. Mr. Saintsbury's knowledge of modern French literature seems to be practically boundless, and this wide acquaintance of his enables him to give a book its proper place relatively to other books with singular felicity and precision. It may be added that this month's essay, besides a critical account of Gautier's novels in general, contains a transla-

tion "as nearly as possible in *extenso* of *La Morte Amoureuse*."

In the *Contemporary Review* Mr. Freeman has commenced his assault upon Mr. Froude's *Thomas à Becket*. The animosity which he contrives to throw into hostile criticism is such as will probably raise a feeling in favour of the victim of the attack. But it cannot be too widely known that in his main charge against Mr. Froude, of habitual inaccuracy, Mr. Freeman is entirely borne out by all competent investigators who have tested his work by the original authorities. Mr. Freeman does not seem to be aware, however, that Mr. Froude, with that thorough honesty of purpose which characterises him, has placed in his main charge against Mr. Froude, of habitual inaccuracy, Mr. Freeman is entirely borne out by all competent investigators who have tested his work by the original authorities. Mr. Freeman does not seem to be aware, however, that Mr. Froude, with that thorough honesty of purpose which characterises him, has placed in his main charge against Mr. Froude, of habitual inaccuracy, Mr. Freeman is entirely borne out by all competent investigators who have tested his work by the original authorities. Mr. Freeman does not seem to be aware, however, that Mr. Froude, with that thorough honesty of purpose which characterises him, has placed in his main charge against Mr. Froude, of habitual inaccuracy, Mr. Freeman is entirely borne out by all competent investigators who have tested his work by the original authorities.

PARIS LETTER.

Paris: February 28, 1878.

Of late years the taste, or rather the passion, for handsome books, beautifully got-up, has rapidly increased. Ancient and rare works have risen to fabulous prices, and it is not unusual for a volume to fetch 1,000 or 2,000 francs. As for new books it is enough that they should be well got-up to secure their success; and I know publishers who will no longer bring out any but handsome editions, finding a better sale for them than for others.

It is due to the charming style in which he has brought them out that M. Lemerre has popularised our contemporary poets; that Sully Prudhomme, Coppée, Lemoyne, will find a place on the shelves of every library. The delightful editions of M. Jouaust have formed a special library, justly called the *Librairie des Bibliophiles*. M. Fischbacher is becoming a rival of M. Lemerre, for he, too, is bringing out in the same size, 24mo Elzevir, a poetical library, some volumes of which are charming—for example, the *Poésies*, more witty than poetical, of Marc Monnier. There is also a delightful edition in 8vo *soleil*, in which M. Fischbacher has published the *Chanson de l'Enfant* of M. Aicard. One of the finest poetical works which he has yet published is the *Prométhée* of M. Grandmougin, which has just appeared. The stately legend of the stealer of fire, the Titan who rebelled against the gods while he civilised man, has fascinated many poets; and the loss of the first and third parts of the trilogy of Aeschylus has added still more to the provoking and mysterious charm of the legend. In these days, when the struggle of science against religious dogma is the characteristic of intellectual life, Prometheus ought to be the symbol and the hero of all those who desire to see humanity freed from the power of the supernatural, and the gods for ever driven from Olympus. The poem of M. Grandmougin is divided into four parts: to the three traditional parts, Prometheus the Fire-stealer, Prometheus Bound, Prometheus Delivered, he has added a fourth, the Temptation of Prometheus. Venus offers to the Titan eternal love if he will renounce his rebellion and his enmity. But Prometheus, hesitating for an instant, repulses the enchantress, declares that he will owe his liberty to none but

men, that he will love none but a daughter of men, and refuses even to notice the love of the unjust gods. At last men, or rather Titans, led by the Oceanides scale Mount Caucasus and deliver Prometheus. The drama closes with the apotheosis of humanity. M. Grandmougin's style is large, sonorous, and majestic, suitable to these ancient stories, and his lines are fine enough to invest with true novelty this well-worn subject. In closing the volume, if the man of letters is satisfied, the philosopher asks himself whether the defeat of the gods was truly the deliverance of humanity; is it not thus subjected to the harsh and inexorable laws of Nature, yet more unjust and pitiless than those of the gods?

The printing-house best known in Paris for beautiful work, where the finest of M. Lemerre's books have been printed, the Maison Claye, now under the direction of M. Quantin, has just begun to publish on its own account; and, as work for oneself is always still better done than work for others, it has just published some perfect gems. This firm has undertaken a collection of the *chef-d'œuvre* of the French classics, in small octavo, two volumes of which have already appeared, *Paul and Virginia*, by Bernardin de Saint-Pierre, and *Adolphe*, by Benjamin Constant, a deep and cruel psychological analysis, exposing the emptiness and the insecurity of an affection of which selfishness is the root. The *L'Amour et Psyché* of Apuleius has also just been published by the same firm in 32mo, with lovely blue borders, and illustrated by reproductions of paintings by Natoire. These books do more than please the eye; they are a real intellectual enjoyment. The value of choice and exquisite works is increased when they are read in these handsome editions; the language seems clearer and more flowing; the surroundings set off the work as the setting does the jewel; but there is some danger lest the setting should be more valued than the jewel—lest it should be thought that the style of publication makes the value of the book. There is more than one bibliophile in our own day who falls into this error.

M. Lévy cannot be accused of fostering such ideas. It would be impossible to publish books more carelessly got-up, as regards print, the quality of the paper, and even typographical accuracy. Happily the solid value of the books redeems the shabbiness of the dress in which they are presented to the public, as, for instance, the *Souvenirs et Mélanges* of the Comte d'Haussonville, where, side by side with some remarkable essays on Cavour, on the Congresses of Châtillon and Vienna (1814 and 1815), we have a most graphic biography of the father of M. d'Haussonville, based on his own statements. He had emigrated during the Revolution, had fought against France, had returned under the Empire, and had accepted the post of Chamberlain to Napoleon. Successively a member of the Chamber of Peers during the Restoration and the Monarchy of July, he was a true specimen of that old French noblesse which, having neither by fortune nor intellect any special part to play in society, was compelled to cling to every power in order to retain a sense of its own importance. In reading the accounts of M. d'Haussonville we catch a glimpse of the gentle but frivolous spirit with which the emigrants bore their trials, singing the *Marseillaise* in the hearing of the astonished Germans, playing at prisoner's base on the English coast to dry themselves after a shipwreck, and later on laughing at the recitals of an old soldier who was gardener to the nobleman whom he had beaten and almost killed during the Dutch war.

M. Renan also has just published, under the title of *Histoire et Voyages*, a most interesting collection of articles which have appeared in various reviews at different times. Finally, M. Paul de Rémusat has given us another of his father's posthumous dramatic works, *Saint-Barthélemy*. *Abélard*, which appeared last year, may perhaps throw the present work somewhat into

the shade. Not only does it give us a picture of manners and events less familiar to us, not only does the love of Héloïse furnish a powerful dramatic element, but the struggles, the doubts, the sins and the sufferings of Abélard, that Faust of the twelfth century, had a wide philosophical bearing, and symbolised the efforts of the human soul in its search after truth. The *Saint-Barthélemy*, which is also a youthful production of Charles de Rémusat, is simply a series of historical scenes—it is history in the form of dialogue, and history as true, as exact as possible. If we look at it in this light, and ask for no more than the author has chosen to give, we shall greatly admire the delicacy with which he has developed the psychology of his characters, and the skill with which he has depicted them. The Massacre of St. Bartholomew has been a subject of discussion between Protestants and Catholics for three centuries. The former look on it as a crime, inspired by religion, planned long beforehand, and executed with premeditation and hypocritical violence. The advances made to Coligny and the heads of the Protestant party by Charles IX. were only traps to hide the atrocious projects of the Court. The Catholics, on the contrary, contend that the crime was purely political, that it was not premeditated, but that, after the attempt to murder of which Coligny had been the object, the Court, threatened by the Protestants with a new civil war, determined to prevent this by a general massacre. Charles IX. consented to it at the last moment, under the pressure of circumstances, and had formerly been quite sincere in his protestations of affection for Coligny. Men are beginning in our days to judge of things more calmly, and, notwithstanding the impudence with which certain Catholic writers seek even now to justify the Saint Bartholomew, and to throw the whole responsibility of it on the Protestants, unprejudiced writers, such as M. J. Loiseau, have treated the question from a truly historical point of view. They have demonstrated that if there had been a general premeditation, in the sense that the idea of getting rid of the Protestants by a general massacre had suggested itself more than once to Catherine de' Medici and the heads of the Catholic party, there had been no special premeditation in the sense that a plot had been formed for the occasion of the marriage of Henry of Navarre with Margaret, and that Charles IX. was sincere when he entered into Coligny's views with regard to a war against Spain and Flanders. But, on the other hand, there was nothing in the conduct of the Protestants to justify the Catholic attack, and the crime must have been preconcerted for the massacre to be accomplished with such fearful rapidity. The historical sense of M. de Rémusat had foreseen these results of modern criticism. The great merit of his books lies in their psychological truthfulness. Nothing is exaggerated, nothing is unduly blackened. Catherine de' Medici would have preferred gentle means, craft and policy; she had recourse to crime because her son was slipping through her fingers. Assassination was repugnant to Tavarres, but when he was once let loose he massacred with the rage of a wild beast, spurred on by monarchical and religious fanaticism. The Italian Gondi, Maréchal de Retz, is the only man who can look on the crime coolly, even gaily, as the most convenient mode of attaining his end and destroying his enemies. But it is the character of Charles IX. which above all is admirably drawn—that nature so violent, yet so weak, uncontrolled, brutal and self-deceived; who groaned under the yoke of his mother and brother; who entered with sincerity into the grand projects of Coligny, and felt himself a king; and who, but a few instants later, alarmed at once by the popularity of the Duke of Guise and the rebellious temper of the Protestants, is willing that every heretic shall be killed that not one may be left to reproach him for the crime.

The different types of Protestants are equally well drawn—those who thought of nothing but civil war, such as Montgomery; those who loved France and the king above all things, as Coligny; those who thought of nothing but pleasure, as La Rochefoucauld. In this drama religion holds the second place, and rightly so, for politics played the chief part in the crime. Besides, in the sixteenth century, except for some pure souls, such as the Bishop of Lisieux, Hennuyer, whom M. de Rémusat introduces on the scene, the Catholic religion was confounded with politics.

The Massacre of St. Bartholomew, like all atrocious and violent acts, did not in the least tend to establish peace and union in the country. It was the signal for a new civil war, and the demoralisation and weakness of France was its only result. Modern history is, moreover, filled with these bloody tragedies, which always defeat the designs of their authors, and never occur without weakening the vital force of the nation.

Much valuable instruction may be gathered on this subject from the new volume of M. Taine on *Les Origines de la France Contemporaine* (Hachette). The first, devoted to the *ancien régime*, had shown that in the eighteenth century the Government was in the hands of a Court and an aristocracy who were lost to all sense of their duty, and who thought of nothing but gossiping and amusing themselves. Every social tie was dissolved. At the first shock the whole building crumbled. It was no longer a question of reform, or even of revolution, it was one universal dissolution. In the present volume (*La Révolution*, I.) M. Taine shows that from the month of June, 1789, it was the mob that governed. It was they who hastened the formation of the Constituent Assembly; it was they who dictated to it the laws which it promulgated; it was they who carried out those laws without understanding them, or who violated them when they were no longer pleasing. To prove this statement M. Taine has searched innumerable unpublished documents in the archives of Paris and of the departments. He proves that from the meeting of the States-General security nowhere existed, murders were committed with impunity, castles were burnt, and the general disorder produced a famine. He analyses with remarkable power the imprudence of the Assembly in destroying at one blow those secular abuses to which were attached secular rights, and even society itself, and in creating, according to *a priori* ideas without regard to tradition or to fact, at a time when every passion and every feeling of hatred was stirred up, a machinery of government which might perhaps have suited perfect beings, but which could only work by the universal goodwill of the people. Thus there is nothing more curious than to see with what a lack of intelligence the new laws were applied, or rather were everywhere violated. The free circulation of grain had been ordered; the ignorant populace forestalled the order, and stole the grain for fear of famine. Trade ceased; this was laid to the charge of the wealthy and the nobles, who were robbed or murdered. The madness and fury of the populace increased with the increase of misery and famine. M. Taine has painted in burning colours this *crescendo* of misery and of crime, each produced by the other, which plunged the whole of society into a vertigo of madness and terror. If his object was to explain why the Constitution of 1791 could not endure, why constitutional monarchy was not established then, why the Revolution of 1789 led France by an inexorable fate first into a reign of terror and then into despotism, he has succeeded admirably.

But it seems as though M. Taine intended to do more than this by giving his book the title of *Les Origines de la France Contemporaine*, and we expected more from him. We could have wished that he had told us what was new in the social and political conception of the Constituent As-

sembly and of the men of that day, which of these novelties were but passing errors, and which on the contrary have become the heritage by which we live to-day—in a word, what the Constituent Assembly accomplished for the future. Further, we could have wished that M. Taine had shown us how its reforms were welcomed in France, why they excited such enthusiasm, why the Revolution exerted so powerful an influence on foreigners. All this is wanting in his book. All the dark shadows of the picture are there, but the picture itself is very incomplete—only the reverse of the medal is shown us. The justification which might be urged for the rioters of 1790 is also wanting in M. Taine's work. He makes it appear that all the nobles were liberal, humane, and full of good intentions; but the projects formed to arrest the Revolution, the threats put forth each day, the continual fear in which the people lived of losing the new blessings which they enjoyed—all this is passed over in silence.

M. Taine has considered events from an outside point of view, and this he has worked out and brought into relief with his whole logical force and his incomparable descriptive power. Thoughtful, calm, large-minded men will find in his books useful lessons and facts of intense interest; but the mass of the public will find there one thing only—an entirely unfavourable picture of the Revolution of 1789. They will cast the book aside, or unduly exalt it, according to their own feelings. It will pass, though wrongly, for a reactionary pamphlet.

Since we are on the subject of the eighteenth century, let me mention the excellent edition of the *Lettres de Mdlle. du Châtelet*, the friend of Voltaire and of St. Lambert (Charpentier), which M. Asse has just brought out. M. Asse has already published, with no less care, the letters of Mdlle. de Lespinasse and of Mdlle. Aissé. G. MONOD.

CORRESPONDENCE.

THE PRINCIPLES OF PHONETIC SPELLING.

25 Argyll Road, Kensington: March 7, 1878.

Owing to the delay which has accidentally occurred in my reply to Mr. Nicol's letter in the *ACADEMY* of Jan. 5, p. 12, Mr. Sweet's letter has also appeared (*ACADEMY*, Jan. 26, p. 78). I have therefore taken the opportunity to alter some portions of my reply.

Mr. Sweet's errors in respect to Palaeotype and Glossic were not committed casually. That respecting Palaeotype referred to a system of writing which he says that he had worked practically, and from which he owns that he had borrowed largely, and yet he shows himself ignorant of the principles on which its notation was constructed. Those principles of course could not be such as Mr. Melville Bell and Mr. Sweet published after my

paper on Palaeotype (read December 16, 1866) appeared in the *Transactions* of the Philological Society for 1867. That respecting Glossic occurs in a "detailed comparison of Glossic and Romic," and shows that his professed careful study had not enabled him even to master its principles, much less its details, while his present letter shows that he is still ignorant of them. But I should not have complained so much of his errors if he had not made them the ground of very sweeping censure. It is hard to be condemned for a critic's own mistakes. Mr. Nicol's argument raises a new issue as to the principles of phonetic spelling, with which, therefore, I head this communication, and to which I shall confine my subsequent remarks.

The "fundamental principles of phonetic spelling, *without which*," according to Mr. Nicol, using his own italics, "*it is not phonetic*," namely "(1), the same symbol always represents the same sound, within the limits of accuracy aimed at," a nullificatory proviso, and "(2) the same sound is always represented by the same symbol" (the same proviso being understood), apply, with the proviso, much more strictly to Glossic than to "broad Romic." Yet take the limits of the proviso to be the "closest appreciable limits," and phonetic spelling rapidly breaks down. Theoretically the principles cannot be carried out at all; for the infinite varieties of sound heard in "glides" cannot be more than roughly indicated. It is only by making the limits very wide indeed that phonetic spelling becomes practicable. No system, not even Palaeotype, or Visible Speech, or Mr. Sweet's complete Romic, can teach the pronunciation of any sentence in any language, without much special instruction for the peculiar habits of that language. It is only the symbols of the "talking phonograph" (see *Nature* for Thursday, January 3) that utter themselves; and if they do so with anything like the degree of accuracy reported, they put all phonetic writing to "open and apparent shame." The principle of the phonograph is also the only correct acoustical principle—namely, to represent the compound vibrations of air actually produced, and not the physiological actions by means of which they are generated. With such a machine it is possible to represent permanently and reproduce mechanically any series of spoken sounds, even those of glides. But by the process of writing and speech, both of which have to be acquired mechanically, and both of which consequently differ within wide limits—for our spoken sounds have all the distinctive individuality of our written characters—we can only hope even with the greatest care to come within a considerably wide margin of the truth, and, with such a small amount of care as would render the scheme efficient for daily use, we must make the margin very wide indeed.

In my Glossic I have endeavoured not only to keep this practical margin constantly before me, but have essayed to work upon new principles, giving a considerable degree of latitude and also of power, never before attempted, and certainly not appreciated by either Mr. Sweet or Mr. Nicol. First, I have used the principle of "combinations," by which I at once appropriated the principles of the ancient syllabaries, the natural parents of alphabetic writing. This is, that the same "combination of signs" (not the same sign) should represent the same "combination of sounds" (not the same sound), and conversely, wherever they occurred. The next was the principle of "alternatives," which was forced upon me, especially as regards received English speech, by actual usage. This is:—

"Where two or more sounds are habitually used without discrimination, or reprehension, in the same part of the same word, by different speakers, or by the same speaker at different times, employ a spelling which indicates that any one of these alternative pronunciations may be used."

It stands to reason that the alternative spelling must not be used where no alternative pronun-

ciation is permissible. Thus it would not be permissible in Glossic to write *ergenst*, *soafer*, *faadha* for *against*, *sofa*, *father* (as Mr. Sweet suggests—*Handbook*, p. 204—in opposition to my principles, for which he has substituted his own incorrect conclusions), because these would imply the alternative pronunciations *u'r'genst*, *soa'fu'r*, *faad'ha*, which are inadmissible. It is quite admissible in private MSS. to write *ugen'st*, *soa'fu*, *faa'dhu*, because these imply received pronunciations, and are not alternative. But for that reason I should object to them in printed books, unless the author wished to emphasise his own peculiarities, because there the alternative character should be shown, and hence I generally print *agen'st* (or *again'st*), *soa'fa*, *faa'dher*, which give the alternative pronunciations *a'gen'st*, *soa'fa*, *faa'dhu'r* (where *a* is the fine *a* in *ask*), while it excludes the others implied by Mr. Sweet's travesty of my spelling, because they may not be used. All this is distinctly laid down, enforced, and exemplified in my *Pronunciation for Singers*, published last July, and my *Speech in Song*, published in February.

Now these, I apprehend, are really phonetic principles. A person cannot be taught to read intelligently from Glossic books without having them constantly instilled into him by the teacher, who would question him about them, especially when he came to write, and elicit from him why he writes *soa'fa* and not *soa'fu*, *soa'fan*, *soa'fer*, *soa'fur*. Without a knowledge thus acquired of course the writer might use any of the four last symbols. If he did, the master would immediately call him to task, and then the pupil would find how books printed in Glossic gave him information respecting alternative pronunciations, which he could never have evolved from his own consciousness, because they are what Prof. Clifford (in a remarkable paper in the last number of *Mind*) calls "ejects," previously existing only in the consciousness of others.

Actual work on phonetics for more than thirty years has very slowly brought me to this conclusion as to the practical character of phonetic writing. The principles laid down by Messrs. Sweet and Nicol remind me of those with which I began. Commencing phonetic work, as they did, with the advantage of the long elaboration which produced Mr. Melville Bell's Visible Speech, they started of course with much more phonetic knowledge than I possessed when I wrote my *Alphabet of Nature* in 1844 (probably before they could utter any words at all), but I was then as confident in the necessity of uncompromisingly carrying out such principles as I have quoted from Mr. Nicol, as they can be now. If they live another thirty years (which they may well see, though I shall long have ceased to speak and hear by that time), they may perhaps come to similar conclusions.

ALEXANDER J. ELLIS.

THE LAKE COUNTRY OF ENGLAND.

Ullswater: March 2, 1878.

Not a little interest is excited in various quarters at present in connexion with the scheme of Manchester to gain entire possession of Thirlmere in order to draw from that little lake both its own supply of water and the supply which it sells to neighbouring Lancashire townships. The Manchester Corporation and people are quite enamoured of their Thirlmere scheme; and nothing will convince them that there is any truth in the opposing allegation that they can only get bad water from that lake, and at an enormous expense. The ideas have fairly taken possession of their minds that lake water is the liquor for them; that it can be supplied to them easily; and that, probably by disposing of it to their neighbours, they may get their own water for nothing, or at least at a very cheap rate. There is quite an enthusiasm in Manchester on this subject; and Mr. Bateman, their

great engineer, even talks of getting hold of Ullswater also.

On the other hand, among the proprietors of the Lake district, and with certain classes throughout England, there is quite another kind of excitement about the scheme, and a great deal of enthusiasm against it. In the first place, there is much suspicion as to the propriety of allowing any tampering with the character of the Lake region—the only district now remaining in England where, on anything like a great scale, Nature is to be seen in its primitive simplicity. The Manchester scheme is specially objected to on the grounds that it involves the raising of Thirlmere fifty feet and the giving to Manchester not only complete command of the shores of that piece of water, but also of its entire watershed, as is proved by the Bill which has been introduced into Parliament. A supplementary objection has been raised by various proprietors whose property will be interfered with by the construction of the aqueduct required to convey the immense quantity of fifty millions of gallons daily from Thirlmere to the Lancashire capital. The opposition to the Manchester scheme has given rise to a "Thirlmere Defence Association," and it is sympathised with and ardently supported by many lovers of Nature throughout the country, including distinguished men of letters such as Mr. Carlyle. The dispute is a very pretty one as it stands. Manchester accuses the opponents of the scheme of being actuated by sentimental considerations; and the opponents of the scheme accuse Manchester of a base desire to get its water for nothing, and of demanding more water when it has already more than it can use for ten years to come.

Thirlmere has hardly the dignity of being a lake. Most, if not all, of the lakes of Cumberland and Westmoreland were originally *meres*, an Anglo-Saxon word obviously existing in Latin and other languages.

"Delicious Grasmere's calm retreat
And stately Windermere I greet,"

said Cumberland, in his "Ode to the Sun," of the largest and of one of the smallest of the English lakes. Besides these two, we have still Thirlmere, Buttermere, and Rydalmere. The word *mere*, however, has in some instances been superseded by that of Water. Half a century ago Ullswater was the name for one of the largest and grandest of the lakes; but now that lake is usually called Ullswater, the first syllable being the Celtic *uille*, or "elbow," from the turn which the lake takes at Hallin Fell; and we have also Wastwater, Conistone Water, Haweswater, and several more Waters. There are also tarns—such as Red Tarn on Helvellyn, and Sprinkling Tarn in Borrowdale—which hardly attain the distinction of being either meres or waters, and much less of being lakes.

Thirlmere is too large to be called a tarn, yet it has scarcely the dignity of being a lake. It is not well known, though thousands of tourists pass it every season on their way from Keswick to Grasmere, Ambleside, and Windermere. Indeed, I have heard tourists who must have passed it more than once declare their ignorance of its existence, though the coach-road runs along its eastern shore. Two small inns, at Whiteside and Wythburn, are patronised chiefly by pedestrians who wish to make the ascent of Helvellyn, and other houses are few. Yet those who take up their residence at Thirlmere will find that it has wonderful attractions of its own. The scenery has a somewhat bare but sublime aspect, increased by the gigantic masses of Helvellyn rising immediately above it, and of Blencathra at a greater distance, but softened by wood towards the upper end of the mere. One or two fine precipices rise up from this narrow sheet of water, which is only two and a-half miles in length; and we can feel there, with Wordsworth, the silence that there is amid the hills.

Thirlmere at present lies undisturbed in its primitive simplicity and sublimity; and even the most ardent supporters of the Manchester scheme must admit that if the project were carried out it would make a great difference in the appearance of that now-secluded piece of water. It is proposed to throw a large embankment across the foot of the lake, and the raising of its level fifty feet will about double the extent of its surface. It is proposed by Manchester to make the embankment "ornamental" and adorned with a picturesque tower, but it is evident that such things would alter the present character of the scene. Ornaments of the kind can be got up anywhere easily enough; but the simple sublimity and beauty of Thirlmere have been created by the hand of Nature, and are much more easily destroyed than ornamented by the hand of man. One effect of raising the level of the water to the height proposed would be to submerge a number of bays with rocky headlands, picturesque with dwarf trees, ferns, and wild flowers. But, still worse, the raising of the level is intended for storing water in the winter season, when most rain falls, in order that there may be a supply for summer, so that at the very season when tourists visit the Lake country we should have Thirlmere decreased nearly to its present level, and presenting, instead of a shore of green meadows, a hideous belt of slimy mud and decaying vegetation. For this, and similar reasons, a great many people throughout England take an interest in opposing the Thirlmere scheme.

On the other hand it is very difficult to make out what reason Manchester has for its demand for more water. At present that city and all the townships which it supplies use only between seventeen and eighteen millions of gallons daily. It has already a supply of between twenty-four and twenty-five millions of gallons daily, and several more millions of gallons daily are about to be supplied to it by the new works, nearly completed, at Denton and Audenshaw. Practically, then, Manchester has nearly double the quantity of water which it requires at present, and enough to serve it for ten years to come, even if it and all the townships it supplies continue to increase in population as they have been doing. This side of the subject, so far as I am aware, has not been met by the Manchester Corporation; for it is evident that interference with the Lake district is only tolerable on the supposition that it has become a real necessity to draw water from that district. The Bill introduced into Parliament by Manchester has been referred to a special and what is called a Hybrid Committee, with power to hear the petitioners against the Bill, whether they appear themselves or by counsel, and to enquire generally into the whole subject. Its Report will be looked for with great interest, for there are hundreds of thousands of people in England who would be extremely sorry to see any tampering permitted with the natural features of the beautiful mountain-district of England. Thirlmere should be dear to English men of letters. On its shore there is the "Rock of Names" (which the Manchester scheme would submerge), where Wordsworth and Coleridge with their dearest friends were wont to meet, on which their names are still inscribed, and which gave occasion to one of Wordsworth's smaller poems; and it has also been beautifully described in the opening and sad closing pages of Arnold's *Oakfield*: or, *Fellowship in the East*.

ANDREW WILSON.

GRIMM'S LAW.

Brixton: March 5, 1878.

The nature of the recent discussion on the above subject in the ACADEMY seems to call upon me for a few words of reply.

1. A well-known and justly-admired article by Karl Verner ("Eine Ausnahme der ersten Lautverschiebung," *Kuhn's Z-S.*, xxiii., 97-130) has been mentioned in terms which imply that the

results therein arrived at are hostile—perhaps fatally hostile—to the hypothesis of the Law which I have endeavoured to sketch out. But this I am hardly prepared to admit. Indeed, if the article had not reached me just too late, I should have tried to show how easily its essential facts fall into their place in my scheme, with no great disturbance of the latter.

But those facts must be distinguished from their interpretation. This is, of course, determined by the fundamental hypothesis of "Grimm's Law" which Verner adopts. What he has demonstrated is that where a primitive (I-E.) tenuis was not immediately preceded by the accent, there, in L. G., a media appears instead of a spirant. With this phenomenon a second is inseparably coupled—namely, the appearance of the voiced sibilant *z* (often subsequently rhotacised) in answer to a primitive *s*; and this, too, is shown to depend, in just the same way, upon the original position of the accent.

Now, in the case of the sibilant, no two interpretations are admissible; but in the case of the mutes Verner requires us to assume that the tenuis was first correctly *verschoben* to the voiceless spirant; and that from this, through the voiced spirant, it ultimately passed to the media; so that the assumed line of debilitation is represented by the following three series:—

k, [*x*, *h*], *g*: *t*, [*p*, *θ*], *d*: *p*, [*f*, *v*], *b*.

But here all that we are absolutely certain about are the two extremes of each series; the three pairs of means are interpolations supposed to be (though perhaps not really) necessary in order to adjust Verner's conclusions to his fundamental hypothesis. The hypothesis I have ventured to sketch out certainly requires none of them. Throwing back, as it would, the origin of the main phonetic characteristics of the German (no less than the Classical) dialects to primitive times, it would derive these abnormal mediae directly from the corresponding primitive tenues.

Now, Verner himself admits, and is bound to admit, that the motive-power, instigating to the changes he assumes, existed previously to the first of these changes, and may very well have belonged to the parent speech. Consequently, the alternative interpretation I have suggested only further requires that such motive-power should not merely have existed, but have operated; in other words, that the ancestors of the Low Germans in the Holoethnos preserved the primitive tenuis when it was protected by the accent, but, naturally enough, allowed it when unprotected to sink to the media. The whole exception would thus fall under the case provided for in my last Appendix, where it is suggested that aspiration of the parent tenuis may, in some cases, have been forestalled by previous voicing. The principal correction required in the body of my book is in the section on the "Exceptions." Instead of the abnormal L. G. media being due to "retention of the tenuis" on the part of H. G., this retention should itself be treated as "conditioned" by the previous evolution of the aforesaid media.

My interpretation, I am bold enough to think, is not without its recommendations. Thus, it introduces no sounds but those of whose existence we are perfectly sure. It restores phonetic proportion (which means parity of change) between the mutes and the sibilants; for now

as *s*: *z* :: *k*: *g* :: *t*: *d* :: *p*: *b*.

And hence, reversely, it avoids the incongruous effects which, on the other view, would have to be attributed to one and the same cause operating simultaneously on similar materials. For the first supposed change (*t* to *p*, &c.) is absolutely independent of the accent, which, in any position, is powerless to prevent it; at the next stage the accent becomes conservative, and *p* (*ay*) passes to *θ* only when not immediately governed by it; lastly, in the case of the voiced spirants, the (transposed) accent is represented as an active modifier, causing them to close up into mediae; whereas, in the

of the sibilant, it is even, in many instances, able to prevent the further opening-out of *z* to *r*.

I am aware that Verner starts by asserting that these German mediae "cannot" come direct from a primitive *tenuis*—an assertion which would exclude from the older German linguistic area one of the best-known forms of phonetic debilitation. At the reason assigned (*viz.*, that such a change would contravene the main course of the *Laut-
schiebung*), if it does not beg the whole question at issue, nevertheless seems to me wide of the mark. For the very characteristic of the phenomenon under discussion is that it is *exceptional*: why then force it under the rule? A cause which, Verner's hypothesis, must long have lain latent, and which, when it awoke to activity, is supposed to have effected a series of changes all differing *inter se*, could certainly, and much rather, by operating earlier, have effected the single and simple change here suggested. And this is equally true if, with the current hypothesis, we suppose the Germans to have carried the primitive *tenuis* with them into a common *Grundsprache*.

The chronological difficulty (if it is such) involved in the one view is not much greater than at involved in the other; for it might easily be shown that Verner's scheme throws back his *L. G. *erschließung** to a very remote antiquity. But I confine myself to the single point of interpretation. On this also Verner proves to be right, his in other respects admirable article will be simply perfect.

2. I have now to admit a discrepancy in expression, though not in intention, between sec. 2 and other parts of my *Study*. In the former I appear to assert the absolutely exact phonetic equivalence of all the corresponding mutes in the principal I-E. mute-systems; whereas further on I speak of non-equivalence of the later and diversely-developed values of some of the sounds as insisted on over and over again. But, I believe, it is assumed even by the current hypothesis of Grimm's Law, that the *L. G.* sounds were *originally* both meant and actually felt to be exact reproductions of the *Cl.* sounds, and the *H. G.* similarly of the *L. G.*; to which I add the suggestion that the *H. G.* system was once much more early perfect than at the late period when it comes to the front: so that, from this point of view, I am (so to say) morally right even in sec. 2. But, having thus struck the keynote of my main theme, I forthwith set aside perfect systems and baffle reasoning, and only thereafter recur to them in so far as reasoning on the concrete leads me up into contact or approximate contact with them. Nevertheless, an author scarcely has the right to throw upon his readers the trouble of interpreting one part of his book by another.

3. In turning for a moment to the remarks (so far as they affect myself) of the writer who has favoured us with his views in the last two numbers of the *ACADEMY*, I propose to assume that he has not really done me the honour of glancing over my *Study*. By this pleasant fiction I shall, I trust, escape all temptation to imitate any of the various epithets and exclamations that he himself so liberally flings about on all sides. In particular, it will allow me to regard as a merely superfluous diversion (rather than in any severer way) his reproduction, in substance, of certain points which I have specially elaborated, in such connexion that he actually makes as though he would hack me down with my own sword. Foremost among those points comes that diversity in the value of the aspirate in various I-E. dialects which forms the main subject of his first letter, and as to which see my *Study*, secs. 3-35, *et passim*. Even his "*tertium-*quid**" formulations occur more than once in secs. 44-45, except that *Haspirate* and *Arđ* do not represent my spelling. Nor, as my Index will show, have I any relationship between the aspirates and spirants, and the nature of the old Sanskrit aspirates, escaped efficient discussion. It is to be presumed, too, that my explanation of the aforesaid diversity is

at least feasible, seeing that our critic himself also makes use, in his second letter, of the principle underlying it: anyhow, a continual reference to the changes which sounds of one language or dialect may undergo on being taken up by another, is a marked and essential feature of my hypothesis. The special illustrations of this principle adduced in the third paragraph of his second letter suggest a sufficient answer to his imaginary interlocutors in the second paragraph. The well-known Welsh peculiarity, for instance, is a definite, regular, and continuous differentiation, which may be traced back for centuries; and those who exhibit it are no doubt under the impression that they are honestly reproducing the correct English mediae. What this, therefore, "proclaims" simply is, that "inability to pronounce" and "linguistic consciousness" do not exhaust all possible alternatives. There is such a thing as unconscious dissimilation; in virtue whereof the speakers of one language or dialect, while imagining that they reproduce the sounds of a contiguous language or dialect, do actually produce only some more or less remote approximations thereto. And there are no limits to the time during which this process may remain active, provided only that the two languages or dialects maintain pretty nearly the same relationship to each other. Hence the supposed proofs that "*H. G.* forms are recent," rather indicate the existence, from an indefinite antiquity, of a differentiation of the kind just described between that dialect and *L. G.* (*Study*, especially sec. 54, *h. i.*).

The class to which our critic's own conjecture belongs is a very familiar one. I have had a word or two to say thereupon in secs. 9, 10. From the facility with which such conjectures may be turned out, there is no reason why we should not have any number of them, all with pretty nearly equal claims to acceptance. You have only to select some race, cognate or alien, whose language, by a miraculous coincidence, exhibits a consonant or two like those of the Germans, and with whom you proceed (on paper) to mingle this people. Beginning, then, with "I can imagine," you pile on whatever you choose to think "may have" occurred; and the final result is something you can smile on with a truly parental complacency.

Now, I feel sensibly enough the difficulties presented by the *O. H. G.* mute-system. Still I doubt if anybody who has looked at the problem before us on all sides will be found to maintain that that system represents aught else than either an imperfectly-evolved or a partially-deranged repetition of the phenomenon presented by the *L. G.* system. The relationship of the former to the latter, and that of the latter to the *Cl.* system, are too completely unique in their nature and resemblance to be attributed to more than a single cause, much less to a succession of diverse accidents. To cut off a corner of the problem, or to account for odd sounds, is of little use. This is why I have insisted, perhaps even too strongly, on attention to the distribution of the sounds as constituting the very essence of Grimm's Law. In treating of this I have really aimed at something beyond—namely, to establish the general doctrine that such symmetrical and harmonious phonetic relationships (at least on a large scale) are due to the action one upon another of commingled or contiguous dialects. If I ever return to the subject, I hope to be able to strengthen both this general doctrine and the particular suggestion I have advanced respecting the original character of the *H. G.* system.

T. LE M. DQVSE.

"MARMORNE."

London: March 2, 1878.

I have no alterations to make in my review of *Marmorne*, nor do I think it necessary to enter into public controversy with aggrieved novelists on such subjects as "literary conveniences" and the classification of novels. But is Mr. Adolphus

Segrave, of Boisviperre, quite sure that he does well to be angry? I gave him, as I thought, and as I find other people think, a decidedly favourable notice, and because it was not undiluted panegyric he informs me that I am an indelicate and deluded person, who does not know that there are two kinds of novels. I fear I must recommend to him the perusal of the earlier chapters of *Gil Blas*. His attitude towards his critics strongly recalls that of a certain Archbishop.

As to matters of fact, Mr. Segrave has invented a delusion for me. I am quite aware of the regulations as to *quotité*; but I was not aware that "extenuating circumstances" and "acquittal" went together. "Circumstances atténuantes," I believed, presuppose a verdict of guilty, and only mitigate its effects in a certain regulated manner. Curiously enough, there is, I think, a "delusion" in England that extenuating circumstances amount to a kind of "not guilty, but don't do it again;" and therefore I noticed what seemed to me a symptom of this delusion. If Mr. Segrave can set me right about this, I shall accept his correction much more gratefully than he has accepted my remarks on the inadequacy of the characters in *Marmorne*.

GEORGE SAINTSBURY.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, March 11.—3 P.M. London Institution: "Analogies of Plant and Animal Life," by F. Darwin.
8 P.M. Society of Arts (Cantor Lecture): "Application of Photography to the Production of Printing Surfaces and Pictures in Pigments," by T. Bolas.
8.30 P.M. Geographical: "On the Magnetism of the Earth," by Capt. F. J. O. Evans, R.N.
- TUESDAY, March 12.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.
8 P.M. Anthropological Institute: "Natural Language of the Deaf and Dumb," by Prof. A. Graham Bell.
8 P.M. Civil Engineers: "On Railway Appliances at the Philadelphia Exhibition," by Douglas Galton.
8 P.M. Photographic: "Fading of Carbon Prints, and Carbon Printing, without the Use of Bichromates," by Dr. Van Monckhoven.
- WEDNESDAY, March 13.—3 P.M. Royal Literary Fund: Anniversary.
8 P.M. Graphic.
8 P.M. Society of Arts: "Further Remarks on Lightning Rods," by Dr. R. J. Mann.
- THURSDAY, March 14.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.
7 P.M. London Institution.
8 P.M. Mathematical: "On Bessel's and Laplace's Function," by Prof. T. K. Clifford; "On the electrical Capacity of a long narrow Cylinder, and of a Disk of sensible Thickness," by Prof. J. Clerk-Maxwell.
8 P.M. Historical: "Historical MSS. Commission: I. The Anglo-Saxon Period," by G. L. Gomme; "Ancient and Modern Political History," by Dr. R. S. Sutherland.
- 8.30 P.M. Royal. Antiquaries.
- FRIDAY, March 15.—8 P.M. Philological: "On the practical Study of Language," by H. Sweet.
8 P.M. Society of Arts (Indian Meeting): "Colonisation of Hill Districts in India," by Lieut.-Gen. McMurdo.
9 P.M. Royal Institution: "Explanation of certain Acoustical Phenomena," by Lord Rayleigh.
- SATURDAY, March 16.—3 P.M. Royal Institution: "Natural History of the Ancients," by the Rev W. Houghton.
3 P.M. Physical: "Transmission of Sound through Copper Wires," by Mr. Millar; "Thermo-Electric Currents in Wires subjected to mechanical Strain," by G. W. von Tunzelmann.

SCIENCE.

The Voyage of the "Challenger."—*The Atlantic.* A Preliminary Account of the General Results of the Exploring Voyage of H.M.S. *Challenger*, during the Year 1873 and the early Part of the Year 1876. By Sir C. Wyville Thomson. Published by Authority of the Lords Commissioners of the Admiralty. (London: Macmillan & Co., 1877.)

A FEELING of regret comes into the mind after reading and studying these handsome volumes. For, while the author enlists our sympathies by having sacrificed the comforts of home and endured the discomforts of ship-board, and to a certain extent disarms criticism, it is unfortunately evident that this work had better not have been

written. Published "by authority," and professing to be a preliminary account of the general results of the great expedition, which was sent forth to bring to light the deposits on the floor of the abyssal seas, to examine into the movements of the ocean, and to solve some problems regarding the distribution of animals and plants, the volumes should be of the highest scientific value, and should contain a careful *résumé* of the work done under the very able commanders of the *Challenger*. This is not the character of the work, and really the task of reviewing it is not pleasurable. Occasional paragraphs indicate that Sir Wyville Thomson can write with elegance and feeling, but, as a whole, the work is defective in its literary merits. It is, moreover, a curious jumble of the records of first-class nautical observations, of admirable natural-history work, of chemical analyses, and of feeble descriptions of scenery and adventure. The observations of the soundings and temperatures are, of course, due to Sir George Nares and his assistants; the high-class biology is by Moseley, the late Von Willemoes-Suhm, and Mr. Murray; the chemistry is the legacy of Mr. Buchanan, "worked up," as the slang is, by Prof. Brazier; and the rest is the offering to science of the Director himself—and not quite "a free-will offering," for the volumes are tolerably costly.

After the country had expended the best part of 70,000*l.* on this great expedition, and had given the Director a credit, amounting to 5,000*l.* a year, for publication purposes, the public had a right to expect a first-class preliminary work, at a very moderate price. Certainly the scientific world had a right to anticipate a work worthy of the reputation of a distinguished scientist. The disappointment is grievous. The book has not even the merit of the priority of its contents. The best part of the scientific work has already appeared in the *Proceedings* and *Transactions* of learned societies, and the adventures on land, of the mildest description, have ornamented the pages of a serious magazine which is celebrated for its religious romances. The work was issued to the public late in last year, but its Preface bears the date January 2, 1877, so that there was abundant opportunity for correcting mistakes in natural-history subjects, and for finding out the results of the work of contemporaries. That some revision was attempted, we may glean by the introduction of a criticism regarding "some ingenious theories" which have been proposed to account for the oceanic circulation. Made in the worst taste, this sneering attack on Dr. Carpenter has been universally condemned; and, therefore, it is to be regretted that the lapse of nearly a year did not calm the dogmatic temper which appears to afflict the author.

The first part of the work contains a description of the *Challenger*, and of the scientific appliances; and those which were invented and used by Mr. Buchanan are exceedingly clever and interesting. After many pages, the results of some dredgings are given, and then, the real work of the expedition having commenced, we begin to study the Director's preliminaries.

We learn that the Gasteropoda "include the great mass of the Mollusca of the present time—for example, the welk, the periwinkle, and the garden snail"—that many have thick and massive shells of carbonate of lime, "secreted from the sea-water;" and that most live on the bottom of the sea, as their organisation demands. Then our old friend *Carinaria*, known to Lamarck, is presented to notice; but it will puzzle the initiated to find its shell, so badly is the creature drawn. Geologists will now learn that *Euomphalus* and *Bellerophon* shells "sometimes go far to make up whole beds of limestone of the Silurian and Carboniferous periods," for the impression has been that they go a very little way. A pretty paragraph introduces the Pteropoda to notice, but the fact that pteropod marls are well known to geologists has escaped the memory of the author, who has moreover drawn a *Olio* with a shell. *Olio* has no shell. Not having come across anything new, we persevere with the book, and come to a fine sprawling amphipod crustacean, described years ago, with a great mass of faceted eyes on the carapace on either side. Sir Wyville, ever on the alert for the discovery of the oldest forms of life amid the recent fauna, is reminded of the resemblance of these eyes to those of *Aegolina* among the Trilobites. Any palaeontologist who comprehends the relation of the eyes of Trilobite "to the cephalic shield and the facial suture" will be under the impression that the resemblance is fanciful. A new *Euplectella* was discovered and drawn, and a very interesting popular notice of the Hexactinellidae is given. But it is spoiled by the old story that the descendants of the fossil "ventriculites" are still living in the modern chalk-beds of the Atlantic. Zittel has shown that none of the genera mentioned by Sir Wyville as descendants have the peculiar structure of the ventriculite genus. This is really extinct, and the modern Chalk is not the same as the ancient, in relation to the percentage of carbonate of lime. A beautiful polyzoon, named after Sir George Nares, is said to have a cup "with a curious resemblance to the Cambrian Dictyonema." The analogy is not even suggestive, and it is absurdly fanciful; so much so that the author disclaims it in the next sentence. A pretty *Salenia* is then noticed and figured, and of course, the genus having been found in the Chalk, this form is most interesting. It really is so, but Sir Wyville should have known that the genus has species in the Eocene and Miocene, and that his pretty form and the Miocene species do differ from those of the Chalk in their morphology. No species of *Salenia*, moreover, has an ocular plate within the anal ring, like that so beautifully drawn on page 146. On comparing this species with the drawings of A. Agassiz it turns out to be wrongly named by the Director. It has not the specific peculiarities of *Salenia varispina*. We must protest against the introduction of the generic name *Calveria*, for the genus to which it belongs was described and named differently by previous workers. Some beautiful little living lamellibranchs were dredged up from a great depth, and they

present some very remarkable features. But the species are not named, and the peculiarities are missed. Later on, a tiny *Avicula* came up; but the curiously palaeozoic *facies* of the form is passed without notice. We are informed in the text that Mr. J. Gwyn Jeffreys is to describe the shells; but here, again, the Director is at fault: they have been placed in the hands of a specialist, as the term is, who has never yet displayed any knowledge of fossil forms.

It will surprise those who are acquainted with the leading microscopists of this country, to learn that the Radiolaria are not very familiar to British naturalists. They appear to be unfamiliar to Sir Wyville, and we would suggest his reading some of Dr. Wallich's papers, and that he should study what has been done, before he plunges into discoveries. The results of dredging appear, constantly, to be poor in sensational objects; otherwise what was the necessity of bringing into the book the well-known corals, dredged years before by the Americans? One of the really interesting things dredged up was a new *Hyalonema*; but here Sir Wyville lost an opportunity, for he might have magnified its value by reminding geologists that Prof. Young has described a *Hyalonema* from the Carboniferous. During the stay at Bermuda the corals and lithophytes were, of course, examined; and the physiologist is informed that both these animals and plants take carbonate of lime from the sea-water, and incorporate it with their tissues. The great prizes found were some Echini of a family which "is certainly allied in many respects to the *Ananchitidae*;" but there are important points of divergence." Really a cursory examination of the drawings of the three kinds indicates that two of them are full of anomalies—so suggestive that we wonder they did not strike the describer at once. The drawings on page 398 are of wonderful forms. A pretty brittle star *Ophioglypha bullata* is described and drawn in the professor's best manner. In the second volume some Noctilucae are turned into Diatomaceae, and then some exquisite Crinoids are described. These have appeared elsewhere, and, with due submission, the Apicrinoid nature of some is very overstrained. Equally interesting are some contributions which have appeared in the Linnean Society's publications, on the marsupial Echini and Ophiurans. But we should have liked the work of Quatrefages, A. Agassiz, and the Scandinavians to have been noticed.

In the general conclusions we are told that "there seems every reason to believe that the rocks of the Mesozoic and Cainozoic series, at all events, were formed in comparatively shallow water." We thought that the modern Chalk was the analogue of the old Chalk, which, some thousand and more feet in thickness, accumulated beyond the range of stones and mud, in the abyssal depths. Of course we are wrong, because no manganese is found in it in lumps; and therefore the modern Chalk is still less analogous to the ancient than some of us believe. The principal delight of some modern dredgers has been to pooh-pooh Edward Forbes, but it now turns out that life is not everywhere abundant in the

abyss, as we were told was the case. It is scarce in the profound depths, and gets scarcer with depth, and that was the real meaning of that great naturalist. Finally, the last statement of the Director relating to a biological conclusion is most astounding. He writes:—"The two great modern groups of the Mollusca, the Lamellibranchiata and the Gasteropoda, do not enter largely into the fauna of the deep sea." With the latter part of the sentence everybody will agree, but the first portion is grossly erroneous. The Lamellibranchs and Gasteropoda are among the oldest forms of life, and we would advise Sir Wyville Thomson to read any late manual of palaeontology, and so glean a knowledge of the succession of life on the globe, before something more than this "preliminary" is attempted.

Mr. Moseley's admirable work does not come within our criticism, but Sir Wyville Thomson should have read his naturalist's contributions before making such a mistake about the affinities of the Tabulata. Neither do we criticise Mr. Murray or Prof. Brazier, but it is rather astounding to find a red clay at 2,740 fathoms containing 56.9 per cent. of carbonate of lime, which ought to have been dissolved on its way down; and another red clay at 2,750 fathoms containing only 4.11 per cent. of this mineral. A little deeper, at 2,800 fathoms, there is 6.42 per cent. of the carbonate, and at 3,150 fathoms 3.11 per cent. Again, at 2,575 fathoms there was 51.16 per cent. of carbonate of lime in the red clay, and in shallower water, at 2,028 fathoms, only 43.93 per cent. of carbonate of lime was found, that being called a globigerine ooze. The clay had thus more of the mineral than the ooze. At the moderate depth of 1,900 fathoms there was a globigerine ooze with 74.50 per cent., and another similar ooze at 2,328 fathoms had 67.60 per cent. of the mineral. Yet in another 110 fathoms a red clay is found, with 52.22 per cent. of the carbonate of lime. It follows from these statements that the carbonate of lime is by no means so deficient as has been stated, and that in some instances the red clay contained much of it, and, indeed, more than the ooze. This exceptional condition leads to the examination of a table of the quantity of carbonic acid gas in the Atlantic, over the great depths (p. 384), and to our surprise only one estimate was taken from February 28 to March 26; yet Prof. Brazier's analyses of the deposits relate to that interval. This is very "preliminary," and it pretty well tells its tale. The theory of the dissolution of the globigerine shells by carbonic acid will be gradually dropped. A very remarkable absence of manganese in Prof. Brazier's analyses must be noticed, and it indicates that this mineral is above the mass of the deposit, and that it is not mixed with it. It is to be hoped that the future great work of the expedition will be far in advance of this unsatisfactory book, which, although it contains much valuable information, is in many places too technical for the general reader, and, on the whole, is not good enough for the advanced student. P. M. DUNCAN.

Aristotle's Politics. By W. E. Bolland and A. Lang. (London: Longmans & Co., 1877.)

AN edition of Aristotle's *Politics*, whether it be a complete one for the student of political philosophy, or a mere handbook for the tripos and the schools, is undoubtedly a desideratum. There are many difficulties in the way of its realisation. The corruptions of the text, the deficiency of good manuscripts, the obscure allusions, the crabbed terseness of the style, are all reasons why this boon should be long delayed. We are afraid that the present edition very imperfectly supplies the gap. It consists of two distinct parts—a translation of the first four books by Mr. Bolland, and a series of introductory essays by Mr. Lang. The latter part is decidedly the best. The essays are written with practised ease, and are evidently by a man who knows his subject; at the same time they are slight in texture. The fullness of allusion is bewildering to a less instructed reader, and the very brilliancy of their style would be likely to dazzle rather than enlighten the passmen for whom the book appears to be intended. Still these chapters are pleasant and useful reading, and the student who has read them once or twice through will have acquired some desirable information about the political side of the life of the ancient Greeks.

The translation of Mr. Bolland is far inferior in merit. There are, indeed, two schools of translation from ancient authors, which may be roughly called the Cambridge and the Oxford schools. The one aims at complete verbal accuracy with as much elegance as is possible under the circumstances; the other aims at producing before everything a literary work, a piece of English which is pleasant to read, and which puts the reader of the translation as far as possible into the position of a good classical scholar who can understand the original with ease. Mr. Munro's Lucretius will serve as a specimen of the one style, Prof. Jowett's Plato of the other. It is doubtful whether Aristotle, at least in the *Politics*, lends himself to this second kind of translation at all. His close, condensed, nervous language must be represented by English equally condensed and nervous, and such English is not easy reading. But whether success be possible or no, Mr. Bolland has not attained to it. His translation is neither intelligible to those who know no Greek, nor is it a safe guide to the meaning of the author for those who can understand the Greek text which occupies half the page. We will refer to a few instances taken from the third book. In III. viii., the last twelve lines present a series of blunders. "Reason" (ὁ λόγος) should surely be "our discussion;" "the case of the Few" is inexact; "the latter" and "the former" require to change places, the sentence at present making nonsense; "it does not really happen that the alleged causes of difference ever exist" should be, literally, "it does not turn out that the causes named above are the real causes of the difference," which is true and to the point, whereas the present rendering is neither. Lastly, in the pursuit of an emphasis which is not in the Greek, the translator has mutilated the sentence beginning καὶ

ἀναγκαῖον μὲν. Turning to III. xii. 6, we find that Aristotle is credited with the following hypothesis: "If, on the whole, size excels virtue more than virtue excels size," &c. Surely a second glance at this might have raised a doubt in the mind of the translator, or of one of the friends who looked over the proofs. In III. xiii. 15 it is perhaps by a misprint that ὥσπράκιζον appears as "usually ostracise them." If not, the carelessness is particularly inopportune, as also is the perversity which in III. xvii. 5 by rendering οὖν "however" destroys the framework of half a chapter. On page 218 (III. xv. 6 sqq.) besides several losses of emphasis, καθ' ἑα μὲν οὖν, κ.τ.λ., mistranslated and destroying the argument, compels the translator, groping for sense, to jam two sentences into one. Finally, if καὶ is not rendered by "also," it is usually omitted—e.g., καὶ . . . δὲ appears as "and;" cf. ἐπεὶ καὶ in III. xvi. 7. In III. xvi. 3, τοῦτο δ' ἤδη νόμος, which is translated "but this now is law," should be rendered "this brings us to law," or "here we come to law." These defects are sufficient to show that Mr. Bolland's cannot be accepted as the final English translation. It is also to be regretted that the fifth (eighth) book is not included, which so closely follows the fourth in subject. In default of other editions this one may be of service; but every student who uses it will feel a keen regret that a better is not easily available.

OSCAR BROWNING.

SCIENCE NOTES.

PHYSIOLOGY.

Is the Human Eye changing its Form under the Influence of Modern Education?—Dr. Loring of New York sends us a pamphlet with this title. It is his object to draw general attention to the bad effects of over-study during childhood on the organ of vision, effects seemingly proportionate to the degree in which the principle of compulsory education is carried out. Myopia or short-sightedness consists essentially in an elongation of the antero-posterior diameter of the eye-ball. A systematic examination of the eyes in large numbers of children attending public schools in Germany, Russia, and the United States, has conclusively shown that school-work is a powerful—perhaps the most powerful—cause of myopia. Again, Prof. Ribot says, in his work on *Heredity*:—"Since constant study creates myopia, and heredity most frequently perpetuates it, the number of short-sighted persons must necessarily increase in a nation devoted to intellectual pursuits." Their number actually has increased to an alarming extent in Germany. Is there any danger of myopia becoming the rule, and normal vision the exception, throughout the civilised world? Of the two factors required to produce such a result, one—heredity—is thought by Loring to be less universally operative than Ribot has assumed it to be. The tendency to inherit a myopic eye-ball is largely counteracted by the opposite tendency to revert to a type already perfect in its adaptation to its environment. Only by altering some important "condition of existence" may this conservative tendency be nullified; and the alteration must be brought to bear, not on a few individuals only, but on the great mass of the community; not one sex only, but on both sexes alike. Universal compulsory education is a condition of this kind, and it is making its influence felt already. It causes myopia in the individual by compelling over-use of the eyes in childhood and early youth; it favours the hereditary transmiss-

sion of the defect by lessening the tendency to revert to the normal type of eye-ball.

Functions of the Corpus Striatum.—At the meeting of the Société de Biologie on January 26, 1878, MM. François-Franck and Pitres gave an account of some experiments throwing light upon the function of different portions of the corpus striatum. They found that when an electrical stimulus is strictly localised in the grey matter of the caudate or of the lenticular nucleus, it does not give rise to any movements. No sooner, however, do the points of the electrodes reach the surface of the internal capsule than a tetanic spasm occurs with explosive violence. Again, feeble stimuli applied to the capsule cause much more active movements than those provoked by far more powerful stimulation of the white fasciculi of the *centrum ovale*. This phenomenon may be explained by supposing that the internal capsule contains fibres derived from the *corpus striatum*, as well as fibres proceeding from the cortical substance. Both sets of fibres are simultaneously excited when the stimulus is applied to the capsule; hence the greater violence of the movements produced. That this explanatory hypothesis is not without a basis of fact is proved by the following experiment. In a dog, from whose cortex the motor centre for the left fore-paw had been removed six months previously, and in whom the corresponding fibres of the *centrum ovale* were absolutely non-excitable, movements were readily provoked in the paralysed limb by stimulation of the internal capsule—i.e., in all likelihood, of the still healthy fibres derived from the *corpus striatum*.

On Vaso-motor Mechanisms.—A fresh illustration of the remarkable power of self-adjustment with which the vascular system is endowed has lately been furnished by Pawlow and Ustimowitch (*Pflüger's Archiv*, xvi., 4 and 5). The mean blood-pressure in the arterial system of a fasting dog having been accurately determined without the administration of curare and without inflicting pain, the animal was allowed to take a meal of dry food. The blood-pressure was then repeatedly determined at successive intervals of time. The maximum depression observed did not amount in any one experiment to more than ten millimètres of mercury. Sometimes, no depression at all was noticed during the three hours following the meal. In this experiment, two conditions were present, both of which might have been expected to lower arterial tension; first, the vessels supplying the abdominal viscera were relaxed; secondly, a considerable quantity of fluid, in the shape of peptic juices, must have passed out of the vascular system into the alimentary canal. A state of equilibrium was nevertheless maintained. If we ask how it was maintained, we naturally turn to the cutaneous and other systemic arterioles for an answer. We know that stimulation of an afferent cutaneous nerve is followed by relaxation of the cutaneous vessels and simultaneous contraction of the vessels within the abdomen. We may imagine that the converse of this occurs in the case now under consideration, a stimulus applied to some of the centripetal nerves of the digestive apparatus causing relaxation of the abdominal and contraction of the cutaneous vessels. This hypothesis was put to the test of experiment by its authors. They found that the mere exposure, for a few moments, of a knuckle of intestine in the rabbit was invariably attended by a contraction of the arteries supplying the ears—a contraction which lasted for some little time after the bowel had been replaced and the abdomen closed. But this experiment, as it stands, is not conclusive; it admits of another interpretation. It might be argued that the relaxed state of the abdominal vessels caused by exposure of the bowel, by withdrawing an undue proportion of the total blood from the general system, causes anaemia of other vascular territories. The

diminished calibre of the vessels of the ear would thus be a phenomenon of a passive not of an active order. To decide this point the experiment was repeated after previous division of the cervical sympathetic on one side. Were the anaemia simply passive, it would clearly take place in both ears alike. But it was found to take place only on the side where the sympathetic remained intact. No effect was produced on the vessels of the ear affected with neuro-paralytic hyperaemia. There can, accordingly, be no doubt that the relaxation of the arterioles in the abdominal viscera during digestion is associated with a compensatory contraction of the vessels of the skin, and perhaps of other parts, the mutually antagonistic phenomena being so nicely balanced as to prevent any noteworthy alteration in the mean pressure of the blood in the arterial system.

Innervation of Sudoriparous Glands.—Setting out from Luchsinger's researches (which have been noticed in the ACADEMY), Nawrocki has endeavoured to ascertain the central origin and exact course of those fibres which terminate in the sweat-glands of the toes in the cat (*Centralblatt für die med. Wiss.* 1878, 1 and 2). It will be remembered that Luchsinger showed that stimulation of the sciatic nerve causes sweating of the hairless surface of the toes in the corresponding paw. When one sciatic has been divided, exposure of the animal to a temperature of 44° to 47° C., or temporary asphyxia, causes sweating of three paws only, the one operated on remaining dry. Nawrocki finds that these sudoral fibres are derived from the spinal cord. To determine their point of exit, and the position of the centre or centres from which they spring, the cord was divided at different levels, and the two methods of exciting perspiration enumerated above were employed. A series of such experiments proved that the secretory nerves for the hind-paws issue from the cord at the junction of the dorsal with the lumbar region of the spine; those for the fore-paws, on a level with the fourth dorsal vertebra. Both sets of fibres originate in a single centre, common to the four paws, situated in the medulla oblongata. By dividing the abdominal and thoracic cords of the sympathetic on one side of the body, and then stimulating the sudoral centre, it was shown that the secretory fibres enter the sympathetic after leaving the cord. Those destined for the fore-paws traverse the *ganglion stellatum*, enter the brachial plexus, and are finally conveyed to the toes either in the median nerve alone or in the median and ulnar together. Those for the hind-paws traverse the abdominal sympathetic and pass into the sciatic trunk.

Manganese in the Blood.—Richet has executed some quantitative determinations of this element by incinerating large quantities of blood, or destroying its organic constituents with chlorine, and then precipitating the manganese in the form of dioxide by the galvanic current (*Bulletin de l'Académie de Méd.*, 1877, No. 46). A kilogramme of blood from the ox yielded on one occasion 2.5 milligrammes of MnO₂, and 584 of iron (in the form of oxide); on another occasion 0.5 milligrammes of MnO₂, with 495 of iron. From 250 cubic centimètres of human blood he obtained in one experiment a trace of manganese too small to be determined; another time, a quantity equivalent to three milligrammes per kilo. He thus corroborates the usual doctrine that any manganese present in the blood should be regarded as an accidental ingredient derived from the food.

PHILOLOGY.

THE most important paper in the last number of the *Rheinisches Museum* is a dissertation by Bücheler on an Oscan leaden tablet found recently in the necropolis of the ancient Capua. The tablet contains a curse or *execratio*. Bücheler discusses it with a wealth of instructive illustration and hypothesis, adding a list of the new Oscan words which it contains. Müller-Strübing publishes a

chapter of a forthcoming work on Thucydides, on the *σπαρτια* of Demosthenes in the year 418. He argues that a right reading of the inscription C. I. A. 180 supports his hypothesis that it was Demosthenes who led the thousand Athenian hoplites to Epidaurus in that year (Thuc., v., 75). Wecklein has some good notes on Aeschylus and Euripides; Klein, a number of interesting remarks on inscriptions and antiquities; and Dziatzko, some observations on Lucilius.

The Merchant Taylors' Hebrew Grammar. The Formal Principles of Biblical Hebrew, as understood by modern Semitists, stated in a Manner suited to Beginners. By the Rev. C. J. Ball, M.A. (Bagster.) This is by far the most useful Hebrew Grammar for beginners. It states principles in "a simple and straightforward manner," and is generally accurate. It is also the first grammar of English origin in which the languages closely allied to Hebrew are used for the purpose of comparison. Some may doubt the advantage of introducing a comparative element into a school grammar. There is, of course, much diversity of opinion on the origin of the linguistic forms of Hebrew, and it would be unwise to occupy the student's attention too much with doubtful explanations. Mr. Ball's experience, however, has probably led him to see that a moderate amount of illustration from the cognate languages assists the young student in assimilating the dry facts of the grammar. He has even inserted some illustrations from Assyrian, and in our opinion these have been selected with care and discrimination; as, indeed, might be expected from the revision given to the book by Mr. Sayce. Perhaps it is a little too much to claim for the book that it represents the views of modern Semitists in general, for it is well known that there are at least three schools of Semitists. But Mr. Ball's work would certainly be much more generally accepted by them than, say, Mr. Mason's or Mr. Sharpe's, both of which we had to criticise severely some time ago. Mr. Ball's comparative philology, however, is only incidental; his knowledge of the facts of the language is solid and accurate. Here, again, the works of modern scholars have been utilised. Thus we find the pronunciation *bätim* preferred to *bötüm*, and the divine name given as *Jahüt* (rather *Yahwé*—comp. Mr. Tennyson's *Yabok*). On page 98 it might have been mentioned that *säbhah*, not *sabb*, is the form found in the Hebrew Bible; and on page 43 we could wish to see some other example of the Arabic article in a Hebrew word than *alkum* (Prov. xxx., 31), which is almost certainly corrupt (Hitzig reads *Elohim*). In the next edition Bickell's Hebrew Grammar (translated by Ourtiss) may, perhaps, supply some additions. But enough of criticism. The book deserves to become popular in English schools and colleges.

MEETINGS OF SOCIETIES.

CHEMICAL SOCIETY.—(Thursday, February 21.)

DR. GLADSTONE, President, in the Chair. A lecture entitled "Laboratory Experiences on board the *Challenger*" was delivered by Mr. J. Y. Buchanan. After describing his laboratory—which measured 10 feet by 5 feet 8 inches and 6 feet high—and its fittings, the lecturer gave a detailed account of the means by which, after estimating the compressibilities of water and mercury, he was enabled to determine the depths and temperatures attained by the sounding-line. The compressibility of distilled water was found to be 0.000049 per atmosphere, or 0.0009 per 100 fathoms; of sea-water 0.00077 per 100 fathoms; and of mercury 0.000271 per 100 fathoms, or 0.0000015 per atmosphere. He then described the apparatus and methods by means of which the amounts of oxygen, nitrogen, and carbonic acid were determined. The most interesting results obtained were the following:—From the surface down to 300 fathoms the amount of oxygen continuously decreases; from 300 fathoms downwards, whatever be the depth, the amount increases. This anomalous result the lecturer stated to be due to the

great abundance of animal life at the depth of 300 fathoms, the increase in the quantity of oxygen for greater depths being caused by its non-consumption owing to the absence of life. The next part of the lecture dealt with the distribution of the sea-water as regards density, in depth and superficially. Two regions of maximum density exist north and south of the equator, corresponding to the tracts frequented by the trade-winds. At 350 fathoms deep a great zone of water of low density is found. The densest water is found in the Atlantic. Light water is found in the neighbourhood of ice and in certain regions immediately after the cessation of the monsoons. The maxima of density lie in the north hemisphere to the S.W., in the south to the N.W., of the maxima of barometric pressure. By taking soundings simultaneously with the water-piezometer and the mercury-piezometer, corrections were ingeniously made for any inaccuracies in temperature of the different layers of water. A hearty and unanimous vote of thanks was given to Mr. Buchanan for his interesting lecture, which was illustrated by many tables and diagrams.

SOCIETY OF ANTIQUARIES.—(Thursday, February 21.)

F. OUVRY, Esq., President, in the Chair. Mr. Everard Green presented to the society a drawing of a brass in the church of Weston Underwood, Bucks, representing Elizabeth, daughter of Lord Hussey, and wife of Lord Hungerford and Sir Robert Throckmorton, who died in 1553. The figure is now headless, but when Lipscomb's *History of Buckinghamshire* was published, it was complete, and accompanied by the figures of five daughters, which are now lost.—Mr. Willett exhibited two small bronzes found at South-stoke, near Chichester. One is a seated figure of Jupiter Serapis, of excellent workmanship; and the other a rude representation of a horseman, perhaps a mediæval chess-knight.—Mr. Peacock contributed a paper on the Court Rolls of Scotter Manor, Lincolnshire, a manor which belonged to the abbey of Peterborough from its foundation to the Reformation, and since then to the bishopric, till it was recently sold by the Ecclesiastical Commissioners. The date of the earliest roll is 1519. In addition to memoranda of the transfer of tenements in the manor, they contain numerous entries showing the jurisdiction possessed by the Manorial Court. Persons are presented and fined for thieving; for baking and brewing contrary to the assize; for not cleaning ditches and water-courses; for refusing to sell beer to be drunk off the premises; for allowing diseased cattle to be at large; for not taking proper precautions against fire; and for other acts, some of which are now under the control of the police, and others which there is no authority to prevent.

NUMISMATIC SOCIETY.—(Thursday, February 21.)

JOHN EVANS, Esq., F.R.S., President, in the Chair. Mr. Percy Gardner read a paper on the Macedonian and Greek coins issued by the Seleucid kings of Syria in the course of their various attempts on the Macedonian throne. Such attempts were made by Seleucus I., Antiochus I., and Antiochus III.; and the two latter kings probably minted money in Europe. Antiochus III. struck money as general or prætor of the Aetolian league, and also at Carystus in Euboea, in which island he passed the winter of 192 B.C.—A paper was also read by Mr. Cochran Patrick in continuation of his series "On the Metallic History of Scotland."

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, February 26.)

JOHN EVANS, Esq., D.C.L., F.R.S., President, in the Chair. A weapon from New Zealand was exhibited by Mr. Hyde Clarke.—Mr. J. Sanderson exhibited some stone implements and fragments of pottery from Natal, and read a paper on the subject of the present native inhabitants and their legends. The President remarked that the great bulk of the implements exhibited were extremely rude, and in respect to the pottery observed that it presented remarkable similarity in pattern to pottery found in this country, a statement confirmed by the Rev. Canon Greenwell, who remarked that the pottery was hard and well-baked, and probably made for use in the household.—Mr. W. St. Chad Boscawen read a paper on "The Primitive Culture of Babylonia," in which he re-

ferred to the rudely-pictorial character of early Babylonian writing, and to its gradual development into a syllabic character, as shown in the syllabaries of Assur-bani-pal, which he illustrated by reference to the growth of pronominal ideas and the change of the archaic forms through hieratic into a court or script hand. Treating the earlier forms as pictorial, he suggested that they gave evidence that the original form of dwelling was a cave, which then gave place to a construction of wattle and dab, and that to a structure supported by wooden beams or columns and having doors and windows. To these were probably attached gardens about the entrance. The honour in which women were held by their children is indicated by the ideograph for mother, which signifies "house-divinity." Mr. Boscawen then stated as his opinion that the early Babylonians used the fire-stick to kindle their fires. The ideograph for "prison" is "dark hole." In these early cities there were policemen who patrolled day and night. A vast number of other curious illustrations of the manners of ancient Babylon were deduced by Mr. Boscawen from the ideographs and syllabaries; and his lecture was listened to with great interest. An animated discussion followed, in which Mr. Bouvier Pusey, Prof. Boyd Dawkins, and others took part.

ROYAL SOCIETY OF LITERATURE.—(Wednesday, February 27.)

CHARLES CLARK, Esq., Q.C., in the Chair. Sir Patrick Colquhoun commenced reading a paper "On Historical Outlines of the Leading Religions of the World," in which he surveyed at considerable length the earliest form of religions in India, which he considered to be Brahmanic; and pointed out how, from the simplicity of the earliest system, as recorded in the *Vedas*, the vast system of idolatry which we know to have prevailed in later times grew up, as it were, insensibly. Sir Patrick then pointed out the origin of the later practices of female infanticide, chiefly among the Rajputs, and of suttee everywhere; and noticed the reforms in the popular religion, first, by Rammohan Roy and, more recently, by Keshub Sen.

PHILOLOGICAL SOCIETY.—(Friday, March 1.)

DR. J. A. H. MURRAY, V.-P., in the Chair. Mr. Alexander J. Ellis, V.-P., read a paper on "Engytype, a new Approximative System of Phonetic Writing for Philological purposes." His two principles were that every sign must represent a whole class of connected sounds (as those represented by *a* in man, ask, father, Fr. passer, Eng. all), and that there should be a power of discrimination by diacritics, (thus, in the five words just cited, *a* might be respectively \dot{a} , \acute{a} , \grave{a} , \bar{a} , \check{a}). He then distinguished eight classes of vowels, represented by the types *i, e, a, o, u, y, æ, ɔ, of which the six first had their general Latin senses, and α its German sense, while ε represented varieties of English *u* in *cut*. The accents were only applicable to the five first and last; for *y, æ*, superior and inferior figures were used, which, added also to the accented letters, gave a very long series. These marks would be added at pleasure of the writer, provided he stated his starting-point, and used them to indicate changes in the directions laid down. When a writer could not feel satisfied with any such forms, he added a diacritic \hbar to the one thought most like; thus, Polish *y* might be $\hbar y$, or most like a deep *i*. When the writer could only say that the sound could not be assigned, but seemed to lie between two others, he wrote x as the symbol of the unknown, and placed it between the others, as $\varepsilon x i$, a dialectal sound not yet analysed, which seems to lie "between" ε and *i*. The diphthongs, aspirate, consonants, clicks, &c. were similarly treated, care being taken that the diacritics were always "in stock" in England, so that the application could be immediate, and that great freedom was always left to the writer in their application, provided the general basis was preserved (which would in any character show the genus of sound), and the hierarchy of the diacritic discrimination (which would show the writer's appreciation of the specific character of the sound).—Mr. Gunlögson then read a paper on Icelandic, with especial reference to theories of the ancient sounds.*

LIBRARY ASSOCIATION.—(Friday, March 1.)

ROBERT HARRISON, Esq., Treasurer, in the Chair. The proposals of the Society of Arts for a Universal

Catalogue of Printed Books were discussed. The Chairman was requested to convey unofficially to the Council of the Society the opinions arrived at, to inform them that the association was instructed by the Conference of Librarians to prepare a scheme for a General Catalogue of English Literature, and to call attention to the papers read at the Conference by Mr. J. Ashton Cross and Mr. Cornelius Walford.—Mr. E. B. Nicholson exhibited specimens of coloured and partly printed catalogue cards, designed and used by Mr. W. Crookes, F.R.S.

ROYAL INSTITUTION.—(Saturday, March 2.)

MR. R. BOSWORTH SMITH's sixth lecture brought the history of Carthage to its close. The lecturer first pointed out the prejudiced view the Romans took of the Carthaginian character, and drew a strong distinction between Carthage as it was and Carthage as the Romans represented it to be. He then traced the concluding years of the great Punic War—the last holding-out in Italy; the transfer of the seat of war to Africa; the recall of Hannibal; and the terrible defeat at Zama. Mr. Bosworth Smith then told the unhappy story of the great Carthaginian's end, his wanderings and death, and sketched in strong outlines some of the traits of his unique character. Then the final destruction of Carthage was recounted: the carrying-out of the implacable flat, *Delenda est Carthago*, the siege, the taking of the Megara, the last assault, and the great catastrophe. To-day's lecture ends the series: it will treat of "Carthage as it is," a subject of which Mr. Bosworth Smith is able to speak from personal experience.

FINE ART.

THE DUDLEY GALLERY.

"NOTHING to wear"—or at any rate next to nothing—might be the verdict on the present exhibition in the Dudley Gallery, opened to the public on Monday last, and consisting, as usual at this season of the year, of water-colours. Nothing that will wear well, and outlive a little chance and change; and nothing that one can wear in the memory or the feeling as a permanent possession. And yet there is no lack of manual skill, sprightliness of perception, and natural appearances nicely hit off: it is much such an exhibition as the average—the lower average—of its predecessors. Our convenience on the present occasion suggests our taking the pictures much as they happen to come on the walls: for a collection of this sort that plan will do as well as another.

Tuning up, by Miss Edith Martineau, is a well-executed half-figure of an Italian itinerant fiddler, finished with careful and unrelaxing solidity, and with serious truthfulness. The portrait of a lady, *In Her Eighty-second Year*, has similar merits; the pink complexion, set mouth, lively eyes, and white hair crossed by a broad band of black velvet, combine into a genuine record, pleasurable to remember. *A May Meeting*, by Mr. Crane, shows a young lady and gentleman engaged in lawn-tennis on a chilly afternoon of spring; the early-flowering trees are in bloom, but the season scarcely trusts itself as yet to be genial; a greyhound couches on the grass. Nicely managed though it is, this is rather a trifling production for so gifted an inventor as Mr. Crane; the network which serves as a barrier between the players acts a rather damagingly conspicuous part in the composition. The *Portrait of the Hon. Mrs. Lyulph Stanley* does ampler justice to this artist, and forms an uncommon colour-arrangement—the dark, warm complexion of the lady, who is standing by a fire-place, her hand drooping over the chimney-piece, and holding a Japanese hand-screen; the bright yellow of her silk dress; and the deep-red folding-screen which chiefly fills up the background. Mr. Waterlow contributes, along with other landscapes, *A Riverside House*, showing right perception, but too little desire of completeness in execution: the same, with added emphasis, may be said of his *Harley-on-Thames*. *A Study of Colour*, by Mr. Guinness, is, we suppose, intended to be a study of good colour—of such colour as serves the purpose of a

colourist. We cannot say that the painter has entirely attained this object, the greenish-yellow brocade which fills a considerable space nearest the eye being somewhat cold and discordant. The work has, nevertheless, some good tinting, and capable painting too. *The Robin* is one of Mrs. Allingham's extremely sweet little bits, with the sunflowers and other blossoms of a small cottage-garden struggling for space within the narrow palings. Miss Constance Phillott treats the endlessly-quoted lines of Wordsworth from "We are Seven," about the country-girl and her "little porringer." The child has a graceful wildness, both in physiognomy and in posing; and, allowing for some tendency to rawness in the colouring, this work counts well to its authoress's credit. A portrait by Miss Helen Miles—*Mrs. J. H. Barber*—hangs near that by Miss Martineau already mentioned: it is natural and life-like, and the forms are pulpy and well-rounded: a little more crispness of handling were to be desired. *The Cottage Garden*, by Mr. F. S. Walker, marks an advance upon anything we had previously seen from this gentleman, and reminds us, at no very great interval, of the artistic method of the late Frederick Walker: solid colour and cunning touch are both here. The personages are three damsels of refined character, and a black cat in the grass. Further on we observe *Italia*, by the same painter—a couple of women amid the lights and shadows of the vines; here, also, there is a good deal to praise in detail, but the attempt, as a whole, does not seem to come so natural to Mr. Walker as his English subject. Of the portraits of children whereof Mr. J. C. Moore's hand is so prolific, by far the best in the present exhibition, and one of the best ever displayed, is the *Daughter of J. Hichens, Esq.*; a girl of five to six years of age, dark of hair and eye, and clear-complexioned, with hands lightly folded, habited in light blue of two varying tints: a needlework curtain forms the background. Mr. Henry Moore sends two works executed with his wonted fullness of knowledge and certainty of method; *Autumn Mist*, a marine, and *Tween Strath and Mountain*, a most vigorous sketch, almost scribbled off (as one might say) in point of mere handiwork, but ample in its array of facts, and of underlying truths, and in the expressional gift for rendering them. Mr. Poynter's sea-piece, *Moonlight in Funchal Bay, Madeira*, may be characterised as a study in indigo-tints, from the deep blue of the clear sky-spaces and of the lighthouse-rock to the grey of the shimmering clouds: a dignified and intelligent piece of work, though it cannot be said that the artist has combined with his well-observed scale of hues so much of actual light as would besem the subject. Mr. Herbert Marshall has a very good eye for atmosphere clogged by natural or artificial mist. London of course supplies him with abundant material of this sort: and he has utilised it to much good purpose in his *Trafalgar Square*, and still more so in the view of *Hastings*. Mr. Coleman is getting somewhat mannered and monotonous in his subjects of female children or budding girls fantastically half-arrayed. *Gold Fish* is a reasonably good specimen, but we have seen others better before now, when the notion, and the girls too, had not reached their teens. *Little Ruth* again brings forward Mr. G. McCulloch as a painter of individuality verping upon whim, but well supplied with painterlike suggestiveness. The colour here is of lurid pallor, and we can make nothing of the smudgy black background—it does not seem to represent any object or appearance in particular. The infant, with her blonde hair, black hood, greenish-yellow shawl, and white pinafore, and her hands clasped over the half-dozen ears of corn which she has gleaned, has an engaging air of steadfast and responsible babyhood. There was a task incumbent upon her, and it has been accomplished. Mr. Joseph Knight is a Lancashire painter of much local name and

some London repute. His *Moorland* on a soppy day, with two well-managed figures, one of them a sturdy old market-dame reckless of umbrellas, is truthful, and rightly directed according to the painter's aim; but the texture is woolly, dense, and ponderous, to an unpleasant degree—wanting in relief and buoyancy. This, it may be urged, pertains to the subject-matter, and so, indeed, it does to some extent; but the thing really at fault is the artistic manipulation, and, until he amends this throughout the range of his work generally, Mr. Knight will not attain—or, at any rate, will not retain—that rank which his admirers would wish to assign him.

Some way beyond this picture hangs the one which, in point of subject-matter and creditable treatment united, may be regarded as the leading work of the exhibition: like several other things which bespeak praise here, it is the production of a lady. Miss Catherine Sparkes paints *Louis de Mâle, Count of Flanders, hiding from the Soldiers of Philip van Artevelde*. It is a very well-chosen subject for a lady, grave and moving in its dramatic crisis, but chiefly, to the eye, dependent upon its domestic and infantine tenderness. The count is not at the first moment descried; but soon one observes him, crouched under the bed, and helping himself further backwards out of sight with his hands. Three armed men with drawn swords are about to enter the chamber, pricking and scrutinising as they advance. The principal space is occupied by the bed and its three prettily-arranged inmates—two chubby little children pilloved and asleep at the head of the bed, and a third at its foot: behind the bed, and close to the tall fireplace, is the mother, anxious and agitated, but nerving herself to apparent composure. The accessories are all well introduced—neither scanty nor superfluous—the pictured saint, the *sabots* on the floor, the infant's black doll. For distribution and expression the subject could hardly be better managed than it is, according to the range of the painter's power and experience: every portion of it has been well reflected upon, and painted both firmly and felicitously. We do not remember the name of Miss Sparkes heretofore: she has now produced a picture which will be popular in the Dudley Gallery, and would no doubt be the same were it diffused by engraving.

Reserving a considerable number of contributions for a second article, we may mention a few which attracted and merited attention as we passed; works by David Carr, Addison, Constance Philip, Tom Lloyd (*Up the River, and Fast falls the Eventide*), Frank Walton (*Ballard Down, Isle of Purbeck*), J. E. Grace, Pownoll Williams, A. Clay, Gustave Gillman (*The Back-gate of the Puerta de Justicia, Granada*), Guérin, J. O. Long, Aston, Hugh Wilkinson, Fulleylove (*The Lions of the Capitol, a fine treatment*), B. F. Berry, Arthur Severn (*The Boulogne Boat entering Folkestone Harbour in a Storm*), W. Hall, Helen Angell, Jane Raven, Yeena King, Alfred Parsons, David Green, Pilsbury (*Farm-yard*), W. B. Gardner, Whipple, Linnie Watt, Jennie Moore, Poncy (*The Bleak Downs*), Mrs. Staples, W. J. Palmer, Patty Townsend, O. N. Hemy (*Off for the Night*), S. F. Mills, Mary Godsall, and Elgood. We have cited the title in the case only of pictures of some superior degree of importance.

W. M. ROSSETTI.

OBITUARY.

AFTER a long life of most useful activity and of kindness and geniality perhaps never surpassed, Mr. Joseph Bonomi died last Sunday, at "The Camels," Wimbledon Park. He was born on October 9, 1798, the son of a distinguished architect who, resigning his position as architect of St. Peter's at Rome, settled in this country and left his mark on its architecture. How much he was valued by Sir Joshua Reynolds may be gathered from the fact that the latter withdrew from his

office of President of the Royal Academy because that body had not elected Mr. Bonomi an R.A. The young Bonomi was a pupil of the Royal Academy, and gained there the silver medal for a drawing and a model from the antique. He worked also in the studio of Nolletkens, and could remember many curious incidents of those days. In 1823 he went to Rome, where he met Gibson; but next year he went on to Egypt, and there accumulated an immense series of sketches, many of which are now in the British Museum. In 1833 he went to Syria, and what was then a difficult matter, to Jerusalem. In 1838 he returned to London, and for several years was actively engaged with drawings for such important works as Wilkinson's *Egyptians*. In 1842 he went again to Egypt, as artist to the Prussian expedition under Lepsius. He assisted Owen Jones in the decorations of the Egyptian Court at the Crystal Palace in 1853, and in 1861 he was appointed Curator of Sir John Soane's Museum, in Lincoln's Inn Fields. But, in fact, no dry list of where he had been at one time or what he had done at another can convey at all an adequate notion of his true services to Egyptology, and perhaps less directly to art—for this reason especially, that a great part of his work and skill went, in fact, to help to make up the reputations of others. Those will value his services best who have had or may have occasion to trust to the faultlessness of his drawings. For such, and for others who may consult his *Nineveh and its Palaces*, or his *Proportions of the Human Figure*, his works remain; but for the many who besides this enjoyed the charms of his personal kindness and geniality, he is no more.

THE bare fact of the recent death of M. A. Poulet-Malassis has already been mentioned in these pages, but he deserves at least a few lines of further remark. As a publisher, he was among the very first to take steps to revive in France that taste for fine and decorative printing and book embellishment which had prevailed among the few and wealthy book-buyers of the eighteenth century; and he occupied himself in the issue of works not only printed with exquisite care, but adorned with head-pieces, tail-pieces, and vignettes that recalled the taste of elder generations. He was likewise among the first to employ the art of etching in book-illustration. But the second great claim he has upon our remembrance is by reason of his having helped largely in the publication of several works which have since taken definite literary rank of a high kind, but which were not in the least sought for by the public at the period of their first issue. His editions of certain of the works of Théophile Gautier, of Baudelaire, and of a now popularly-accepted humorist, Charles Monselet, were a drug on the market for months or years—they are now very hard to meet with, and eagerly sought after by the bibliophile. Many years of M. Malassis' middle life were passed at Brussels, where his services to literature were less notable. Since his return to Paris, in the days of the present Republic, he has given to the world more than one volume of interest—such as that of the Correspondence of Mme. de Pompadour, and that on Molière judged by his contemporaries. His life, whether as writer or publisher, was a difficult one, and he has died leaving little for his widow besides his collections, one of which (the engravings) is to be sold immediately in London, at Messrs. Sotheby's, while the other (the rare books) is to be dispersed under the hammer in Paris some time during the month of May.

ART SALES.

THE eight days' sale of Greek coins belonging to his Excellency Subhi Pasha was finished on Saturday last, by Messrs. Sotheby, Wilkinson and Hodge. Among the most interesting lots were the following:—Corinth, silver, Pegasus, rev. Quad. incus., a rare tetradrachm, 9*l.* 17*s.* 6*d.*; Chalcis, silver, head of Apollo, rev. XAΛΙΚΙΩΝ

lyre, 8l. 8s.; a gold double stater of Alexander III., Pallas, rev. Victory and trident, 2s. 6d.; others, 5l. and 5l. 10s.; Philip V., rev. Perseus, rev. name and club in oak wreath, 15s.; Perseus, silver, head of king, rev. name eagle on fulmen, 16l. 16s.; Abdara, silver, an unpublished variety, with griffin and a dancing n., 5l. 17s. 6d.; Aenus, silver, head of Mercury, AINI, 6l. 10s.; Aenus, silver, head of Mercury, AINION and goat with star, 13l.; Prusias II., rev. head of king, rev. Jupiter, with thunderbolt and eagle, 10l.; Cyzicus, distater, gold, 10l., rev. Quad. incus., 8l. 5s.; Magnesia, silver, d of Diana, 15l.; Smyrna, head of town, rev. ne and lion, 10l. 5s.; another, 9l. 15s.; Soli, rev. Phrygian anchor, rev. ΣΟΛΕΩΝ, grapes and 10l. 2s. 6d.; Heliocles, silver, bust, rev. iter with fulmen, 8l. 10s.; Arsinoe II., gold, d, rev. legend without trident, 6l.; Ptolemy I. l. Berenice, 8l. 8s.; another, 7l.; Berenice II., d, rare but poor and pierced, 15l.; Amphipolis, rev. Apollo, rev. torch and tripod, 20l.; four d distaters of Cyzicus, 7l. 5s., 6l. 2s. 6d., 2s. 6d., and 6l. 12s. 6d.; Arsinoe, gold, veiled id, rev. name and cornucopia, 8l.; Arcanaria, rev. head of Apollo, rev. ΘΥΩΝ, Diana and chor, inedited, 10l. 15s.; Aenus, head of Mercury, 6l. 10s.; Smyrna, silver, head of Cybele-ylene, rev. lion and ΦΑΝΗΣ in wreath, 6l.; gnesia and Mæandrum, silver, bust of Diana, 10l.; Elæus, silver, turreted head, rev. draped ale in a wreath, probably unique, 33l.; Cyreca, Barca, full-faced head of Jupiter Ammon, 10l. The entire sale realised 2,475l. 4s. 6d.

At a recent sale at the Hôtel Drouot certain valuable objects of art were disposed of, among them a magnificent decorated mirror, which realised 400l.; busts of Louis Seize and Marie Antoinette, repoussé work, in silver, 101l.; busts in terra-cotta by Roland, 420l.; a Louis Seize sofa, exquisitely sculptured, 404l.; and, finally, for 600l., a splendid example of Gobelins tapestry, representing *The Feast, Dancing and Music*, from designs of François Boucher. We are that during the present month a large collection of the eighteenth-century French engravings was sought for with such avidity will be offered at the Hôtel Drouot.

NOTES ON ART AND ARCHAEOLOGY.

CURIOUS and very rare woodcut, by Wenceslaus Hollar, called *The Great View of Cologne*, is acquired by the British Museum at the sale of Dr. F. Heimssoeth's collection, which took place a few months ago at Frankfurt. This elaborate work is engraved on four large blocks, and printed on eight sheets of paper. It gives a bird's-eye view of Cologne in its whole extent, with all its principal buildings and spires marked with their names. On the other side of the river, from whence the view is taken, is Deutz, surrounded by fortifications and large barracks, before which are to be seen soldiers exercising, and other details. To the right are fields with animals grazing, while to the left, on a small hillock, stand a group of twelve persons, men and women of all conditions, chief among whom is the Burgomaster of the town. An inscription, beginning "Agrippina Prima," is a richly ornamented cartouche at the top of the engraving, tells us that Agrippina, who was born there, was the foundress of the city, and the Empress is represented on the left with the symbols of architecture, while to the right are the three patron saints of Cologne. In the two upper corners are porte-enseignes bearing the city arms, and underneath the whole engraving, in a long band, come the coats of arms of all the various cities and guilds, ending with those of the reigning burgomaster, his shield standing somewhat apart from the rest, with an inscription underneath. At the bottom of all is given a short history of the town and its various industries, finishing with some verses in praise of "the good time that there was in Cölln in the year 1463." The

British Museum copy is a perfect impression of the first edition of this work, which is so rare that only two other examples are known to exist, one at Vienna and the other at Cologne. It is described by Parthey.

THE British Museum has also obtained two very rare prints by Marcantonio Raimondi, which Mr. Reid has long been wishing to add to the already magnificent collection of that master's works in the Print Room. These are *Christ with the Banner*, standing in an almond-shaped glory, a nobly designed work of most delicate execution (Bartsch, 77); and *Angélique et Medor*, two figures seated toying together in a landscape, a conventional design only remarkable for its rarity (Bartsch, 484).

WE were able to mention some time ago the project of establishing in Scotland an important Society of Painters in Water-Colour, and we ventured to urge upon its future members and their patrons the study of the earlier English masters of water-colour who have given dignity to this department of art. We are now delighted to hear that it is proposed to hold, before the end of spring, in Edinburgh, in the Museum of Science and Art—an institution in many respects analogous to the South Kensington Museum—an exhibition of water-colour drawings by the greater and accepted masters. Well-known connoisseurs, amateurs, critics, and collectors have already been applied to to lend such examples of the art of Girtin, Turner, David Cox, De Wint, and other like masters, as they may be disposed to deprive themselves of; and it is hoped that such a response will be made to the invitation as shall enable the director of the museum to throw open to the public of the North an exhibition of great interest and value.

No one who has any real interest in tracing the development of the art of Turner will neglect to see Mr. Ruskin's Turner drawings, on view at the rooms of the Fine Art Society. It would be difficult to overrate the importance of the exhibition, for Mr. Ruskin, notwithstanding the rare generosity with which during his lifetime he has given to Oxford and to Cambridge possessions that must have been an immense delight to him, is seen to be still the owner of a collection of Turners which, as a whole, is not to be surpassed in England, save by the monumental assemblage of our National Gallery. Two things ought promptly to occur to the mind of every visitor to the Bond Street rooms: the first, that Mr. Ruskin's collection is so formed as singularly to elucidate the artist's progress in his art; the second, that the collection, notwithstanding its variety, has also a harmony and unity which bespeak in its formation the action of one mind, guided by the very highest taste. In both respects the collection is widely different from the great chance gatherings due only to the lavish expenditure of money through the advice of the dealers. There is enough early work to show what were the processes through which Turner progressed to perfection in his art. Then, again, there are probably the most chosen examples existing in England of the first sketches made by Turner among the Alps at a time when even the most reserved employment of colour did not prevent him from conveying his impressions with magnificent and controlled strength. The *Bonneville* (No. 10) and the two drawings of the *Aiguillette* (Nos. 11 and 12) are among the very finest examples that we know of his earlier power. The *Bonneville*—probably the earliest sketch of all—has every quality that a sketch should have. In pure draughtsmanship it is scarcely less than majestic, and its broad faint tinting suggests with extraordinary delicacy the colours and tone of the scene. Following near upon this mountain series, done in Turner's early maturity, we have the series named by Mr. Ruskin in his invaluable little catalogue, "Dreamland—Italy," and then the series "Reality—England at Rest," and the

later series "England Disquieted." To the first belong several drawings which, whether or not they deserve all the praise Mr. Ruskin gives them, are at least exquisite examples of selected form, of the high elegance which was a joy to Turner at that time. Their scheme of colour—take No. 16 and No. 17 for example—is, however, without either the quiet harmony of the earlier sketches or the bolder harmonies and contrasts of some of the later. They are of the class that seem to us to lose little by translation into the delicate black and white of the line-engravers occupied in Turner's middle-life with the illustration of dainty books. The "England at Rest" set contain some among the Yorkshire drawings—notably a *Richmond, Yorkshire* (No. 27)—on which Mr. Ruskin justly sets great store, since "there is no more lovely rendering of old English life" than this, in which the unspoiled town of fifty years since is pleasantly surrounded by meadow and river. Some of the subjects properly belonging to the "England Disquieted" must have been conceived and treated earlier, we think, rather than later than some of the Yorkshire drawings. The drawing No. 32—*Dudley Castle*—is a splendid example of the more rapidly executed work of the later period of the "England Disquieted": a sketch slight and summary indeed in comparison with the *Richmond* or the *Farnley* of the "England at Rest;" and, when seen in contrast with these, it is strangely confirmatory of that theory with regard to Turner's change of sentiment which Mr. Ruskin now not for the first time seeks to establish. *Salisbury* (No. 38) is one of the most absolutely accomplished of all the works in the exhibition; every resource of invention, incident, line, colour, and passing effect, is brought to bear upon the beauty of Turner's treatment of this theme. Still later we reach examples in which it is clear that, while Turner had not ceased to gain, he had also lost very much. A vision of *Arona* suggests a kind of unearthly beauty which Art before Turner had hardly essayed to present, and the fairyland character of his later designs is shown by, among others, the *Bridge*—Nos. 60 and 61—lovely light things whereon the light brush has but just rested. Next week we shall take occasion to add a brief note on the engraved work likewise exhibited.

THE Louvre has recently obtained casts of all the principal sculptures discovered at Olympia. These casts will serve to complete the remains discovered by the Morea scientific expedition in 1829, and will be of the greatest service in helping to reconstruct the figures to which these valuable relics now in the Louvre belong.

Two fine pictures by Rubens, *A Holy Family* and the *Head of an Old Man*, in the possession of the Duke of Wellington, have lately been photographed by M. Lombardi. The excellent reproductions of the drawings by Rubens in the National Gallery taken for the Rubens Fête at Antwerp by this photographer may now be obtained. The most remarkable of these are the four sketches for his magnificent painting of *The Fall of the Damned* at Munich, two studies for Crucifixions, and a portrait of a young girl. These Rubens drawings are not exhibited at the National Gallery.

AN interesting study of Daubigny, as one of the *Paysagistes Contemporains*, was contributed by M. F. Henriot to the *Gazette des Beaux-Arts* in March and May 1874. Two beautiful etchings by him are also given in these numbers, as well as a number of woodcut illustrations, and a catalogue of his etched works, valuable to students of this delightful and much-to-be-lamented master.

THE Manchester Academy of Arts have this week opened their annual exhibition. It is intended to issue in connexion with it an "Art Annual," containing illustrations of the more notable pictures from sketches by the artists. This will be edited by Mr. Richard Smith, B.A.

A TELEGRAM in the *Times* from Rome announces the death of Mr. Lawrence Macdonald,

well known for his portraits and busts of English Peers of more than one generation; and the serious illness of Mr. Joseph Severn, the artist and friend of Keats.

THE *genre*-painter, Alexandre Jean Antigua, died in Paris on the 27th ult. He was born at Orleans in 1818, and received his artistic education in the studios of Norblin and Delaroche. He began with religious subjects, but in 1846 he took to *genre*-painting, and produced in succession *The Chimney-Corner*, *The First Plaything*, *The Storm*, and *Women Bathing*, which were all purchased by the Orleans Museum. His best-known work is *The Fire*, now in the Louvre.

M. EUGÈNE MÜNTZ has been appointed Librarian, and M. Etienne Arago Archivist, to the Ecole des Beaux-Arts.

THE STAGE.

THE first appearance of Herr Neville Moritz, the Hungarian actor, upon the English stage has resulted in considerable disappointment. His performance of Othello at the Queen's Theatre on Saturday afternoon revealed neither extraordinary natural gifts nor subtle insight into character, and on the whole did not rise far above that mediocrity of which we have already upon our stage an abundance of examples. Herr Moritz's Othello is habitually a rather rough and blustering hero, who threatens and stamps his foot a good deal, and has little majesty of presence or dignity of demeanour. So far, we observe, this impersonation has been defended by a friendly critic, who boldly asserts that German criticism upon Othello is agreed that there is nothing grand or stately about him; but it would be unjust to hold Herr Moritz responsible for an assertion so entirely unfounded and erroneous. In one respect the idea of Herr Moritz's impersonation was preferable to Salvini's. The actor has perceived that from the moment that the determination to kill Desdemona as an act of inflexible justice has taken possession of his soul his self-command becomes strongly marked, and is intensified by his stern resolve. Hence, instead of those violent struggles and wild-beast-like paces to and fro which characterised Salvini's performance in the last act, we have striking self-possession and directness of purpose. The execution, however, fell short of the conception, partly from the actor's habitual lack of noble carriage, and partly from the absence of those rare qualities of voice which can alone give grandeur to an actor's utterances. For the same reason, after the discovery of the cruel deception of which he has been the victim, Herr Moritz's delivery of the lines failed to sound the great depths of pathos. The best-spoken passage was the last speech; and this deserves the more to be mentioned, because few actors here succeed in indicating the infinite calm which has descended upon the spirit of the Moor in the moment that precedes his self-inflicted punishment and welcome release from the burden of unavailing sorrow and remorse. His desire even then to stand well, or at least as well as "these unlucky deeds" will allow, in the eyes of the world, and, above all, his unwillingness to be regarded as a mere soldier of fortune, deserving only of the grudging confidence and harassing suspicions with which a Christian republic must have sometimes vexed the noble spirit of the Moorish commander, are touches of truly human inconsistency such as are rarely to be found in other writers. It is in this spirit that the long bygone incident of slaying the "malignant and turbaned Turk," who "smote a Venetian and traduced the State," occurs as an illustration more to the purpose than mere assurances of identification in feeling with his adopted country and genuine loyalty towards its government; and there seems to be a subtle truth even in the somewhat ornate and Oriental diction wherein his thoughts clothe themselves in this supreme moment. These are matters which demand subtler changes of tone than Herr Moritz has at command; but the

shades of thought and feeling were nevertheless indicated, and the ominous calm of his demeanour throughout this speech had a fine effect. Herr Moritz will repeat his performance at the Queen's Theatre this afternoon.

A RATHER absurd story, originally put forth by the paper entitled *Mayfair*, and copied into other journals, to the effect that the Baroness Burdett Coutts had taken a lease of Drury Lane Theatre, and intended to make Mr. Irving her acting manager, is contradicted on authority. The Baroness Burdett Coutts does not, it appears, intend to embark in theatrical enterprises, nor is Mr. Irving very likely to imperil his health and reputation by confining his appearances to the vast stage of Drury Lane. That enormous theatres compel actors to rant in order to be heard, and are otherwise destructive of the subtler graces of acting, is now generally acknowledged, in spite of the high authority of Edmund Kean to the contrary. Mr. Chatterton, who as a rule produced spectacular pieces and pantomimes, was well aware of this. Even managed in his common-sense and business-like if not very exalted spirit, it is known that Drury Lane has not been a very profitable venture; hence the complimentary benefit to Mr. Chatterton at Drury Lane, which has this week put him in possession of a handsome present and substantial token of the goodwill of friends. Any attempt to restore to Drury Lane the character of a home of the poetical drama, which it perforce enjoyed when protected by a rigid monopoly, would in these days of comparative freedom in dramatic matters inevitably result in disaster.

In withdrawing *The Ne'er-do-weel*, after a week's trial, Mr. Neville, who obviously speaks under the inspiration of Mr. Gilbert, confesses the justice of the condemnation both of the public and the critics with a frankness which is not the less commendable because it is rare. If this fashion should extend, a new dramatic-managers' vocabulary will be required, wherein the term "immense success" will no longer be deemed equivalent to disastrous failure. Mr. Gilbert promises to re-write his play, modifying even the first act and a half, although that portion, it appears, has (for what reasons we know not) afforded pleasure to some persons. The truth is that not only the superstructure but the very foundations of the piece must undergo considerable changes before the *Ne'er-do-weel* can give entire satisfaction.

MISS NEILSON has appeared this week at the Haymarket in the character of Julia in Sheridan Knowles's play of *The Hunchback*, Miss Henrietta Hodson appearing in the same play in the part of Helen.

THIS evening Mr. Irving will appear at the Lyceum in the version of Casimir Delavigne's *Louis XI.* which was made by Mr. Boucicault for the late Mr. Charles Kean many years ago.

THE new romantic drama by Mr. Palgrave Simpson and Mr. Claude Templar, to be produced at the St. James's Theatre this evening, is called *The Scar on the Wrist*, instead of *Memories*, as originally.

MR. AND MRS. KENDAL will commence their tour with *Diplomacy* in August. Miss Kate Pattison will be entrusted with Mrs. Bancroft's part of the Comtesse Zicka.

MR. ROBERT BUCHANAN has, we understand, another play ready for rehearsal.

ON Monday afternoon there is to be a performance at St. James's Hall in aid of the Ladies' Work Society, of which Her Royal Highness Princess Louise is president. The programme includes the double attractions of music and recitation, Mr. Henry Leslie and his choir being responsible for the one, and Mr. Brandram for the other. The subject is the *Midsummer Night's Dream*, with Mendelssohn's music as an added attraction to Shakspeare's words.

M. SARDOU's new comedy, *Les Bourgeois de Pont-Arcy*, was produced last week at the Théâtre du Vaudeville with complete success. The leading characters were sustained by Berton, Blanche Pierson, Parade, Delannoy, Mlle. Delaporte, Mlle. Céline Montaland, and Mlle. Alexis. M. Sardou in this comedy pursues his accustomed method of devoting the first act and great part of the second to comedy scenes depicting the kind of society in which his hero and heroine are destined to move. As in *Rabagas* political satire is his object, and the little meannesses of typical political intriguers in a typical small town are sketched with marvellous skill and fertility of invention. All this, however, has no very essential relation to the story on which the strong interest and dramatic incidents of the piece depend. This story, which turns upon the self-sacrifice of a son, who heroically takes upon himself the odium of a rather disgraceful amour, by way of shielding the memory of a dead father, is somewhat artificial in character, and will not bear the test of examination for probable and sufficient motives. Unquestionably the hero by this "pious fraud" inflicts a great deal more pain upon worthy people than they would have been likely to suffer by disclosure of the true state of the case. But on the French stage the protection of a parent's memory is regarded as an object sufficient to excuse almost any sort of falsehood and extravagance. Hence, perhaps, the fact that audiences of the Vaudeville appear not to have felt the force of the objections which have nevertheless been urged by the ablest and most impartial of French dramatic critics.

La Police Noire, a new play in five acts, by M. Alfred Delacour, produced at the Théâtre Cluny, is an elaborate melodrama of a rather old-fashioned kind, the scene of which shifts alternately from *Le Havre* to Wapping, and from Wapping to New South Wales. It seems to have given satisfaction.

MUSIC.

IGNAZ BRÜLL'S "GOLDEN CROSS."

BY his production at the Adelphi last Saturday for the first time in England of Brüll's two-act opera *The Golden Cross*, Mr. Carl Rosa has fulfilled one of the most important promises of his prospectus. The first performance of the work on any stage took place at the Berlin Opera on December 22, 1875, and within the little more than two years that have since elapsed the music has made its way to many of the principal opera-houses in Germany, it having been specially successful at Vienna.

The libretto, written by Herr Mosenthal, is simple and pleasing. A young miller and innkeeper, Nicolas Pariset, residing in the year 1812 in the little village of Melun, not far from Paris, is on the point of being married to his cousin Theresa. On his wedding-day, a recruiting sergeant, Bombardon, makes his appearance in the village, and among other conscripts Nicolas is enlisted. His betrothed and his sister, Christina, are in despair, and the more so as Bombardon tells them that the only possible chance of escape for Nicolas is the finding a substitute—no easy matter. Christina appeals to the young men of the village, her suitors. She takes from her neck a golden cross, and says that whoever will take her brother's place shall receive from her the cross, and on his return after the war shall, on presenting the cross, have the right to claim her hand. But the danger is too great, and none of the villagers will volunteer. The drum sounds the signal for the departure of the recruits; and just as Nicolas is bidding farewell to his betrothed and his sister, Sergeant Bombardon enters, and says that the substitute is found. Christina asks his name, but he is told that it is to be a secret; that she shall know it when he returns to claim her hand. The

audience is aware that he who has generously taken Nicolas' place is Gontran, a young French nobleman, who has accompanied Bombardon, and has watched Christina's devotion to her brother with deep interest. Evening comes on; the soldiers march away, and the act ends with the resumption of the wedding festivities.

Between the first and second acts three years elapse. The scene is the same as before—the little inn and mill at Melun. Nicolas and his wife, Theresa, appear, the former in military uniform and with his arm in a sling. On the invasion of France by the Allies in 1814, Nicolas, in common with everyone else, enlisted to defend his home; he has been wounded in action, and returned to the inn bringing with him the captain under whom he had served, and who had also been wounded. The Captain and Christina have fallen in love with one another, though neither is aware of the other's feelings; and Christina resists the growing sentiment, because she has promised herself to the bearer of the golden cross, who has not yet returned to claim her hand. The villagers, such at least as have survived, are all home again; but not one of them can give her any news. At length "the Captain" announces himself to her as Gontran, who went in her brother's place. Overjoyed, she asks him for the golden cross; but he has not got it. He tells her that when lying, as he believed, mortally wounded on the field of battle, he gave the cross to a comrade, telling him to deliver it to her, and to tell her that she was free from her vow. She, however, disbelieves the statement, as she knows that her brother and Theresa are most anxious that she should marry the Captain, and thinks that they have concocted this little plot to accomplish their end. Gontran, much pained at her mistrust, determines to leave the place; and Christina, though grieved at having offended him, determines to remain faithful to her promise. At this juncture Sergeant Bombardon arrives in a most dilapidated condition—with a wooden leg, and a face covered with scars. He brings back the golden cross, and after teasing Christina by pretending that he is the rightful owner, tells her that it is no other than Gontran; and of course all ends happily.

Such is an outline of Herr Mosenthal's libretto, which, it will at once be perceived, offers good scope to a composer. Before proceeding to speak of Herr Brüll's music, it ought to be said that the English version, by Mr. John P. Jackson, is most excellent, the lines being not only graceful and flowing, but well adapted to the music.

There is probably no form of composition in which a musician's originality, if he have any, or his lack of it, if he have it not, will be more perceptible than in the opera. After hearing Herr Brüll's concert at the Crystal Palace a week ago, I remarked in these columns that individuality of style was hardly the composer's strong point; and the judgment expressed on his music then was confirmed in every point in listening to the *Golden Cross*. The music is throughout most artistic and pleasing; it is excellently written, thoroughly appropriate to the dramatic situation, often of real beauty, and occasionally (as in the finale to the first act) powerful; but it contains little that is absolutely new. Of positive reminiscences there are very few, and these, by the way, are chiefly from Auber; but throughout the work one has the impression of having heard something similar before. This is not said in disparagement of the music—because if Herr Brüll is not a great inventive genius, the same may be said of nine out of ten modern composers, whether German, French, or English—but simply to give, as far as may be, a correct idea of the work. The overture is extremely pretty, though not very original; the best number in the opera is unquestionably the finale to the first act, in which the composer is heard to great advantage. The mingled strains of the wedding music and the march of the departing soldiers, with the song of Gontran heard in the distance, are treated with great skill, and produce the

happiest effect. Among other pieces deserving of mention are Christina's Romance, "Still young, our parents dying," in the first scene; Gontran's air in the first act, "What is life, if love's devotion;" the duet between Theresa and Colas, which opens the second act; the drinking quartett, and the duet between Christina and Gontran in the same act. The music allotted to Bombardon (who is a kind of double of Sergeant Sulpice in *La Fille du Régiment*) is very pretty, but more commonplace in its themes than that of the other characters. The total impression produced by the opera is that, though not a very great, it is an extremely enjoyable work, and one which from its artistic workmanship will find favour with the musician, while its flowing and melodious grace will commend it to the general public.

For the performance, as usual, we have nothing but praise; it is "the old, old story." Everything that Mr. Rosa brings forward is presented with a completeness that leaves nothing to desire: and if the composer of *The Golden Cross* were not satisfied with the rendering of his work on Saturday, he must indeed be hard to please. By her impersonation of the devoted sister, Christina, Miss Julia Gaylord made a distinct advance in her position as an artist: she has hitherto been heard chiefly in light parts; but her acting, especially in the second act, showed a power over the pathetic, and a capacity for undertaking more serious characters for which few of her audience could have been prepared. I do not think I am guilty of any impropriety in repeating a remark which I casually overheard in the theatre on Saturday. One of the most eminent German musicians at present visiting this country said that he had seen the opera on nearly all the chief German stages, but that he had never seen so good a Christina; and this may well be believed. Miss Yorke, as Theresa, was also most excellent, though the music lies rather high for her voice. Mr. Joseph Maas, a tenor singer who was heard some time since in London, but who has of late years been connected with the Kellogg Opera Company in America, made his first appearance with Mr. Rosa as Gontran. In the first act Mr. Maas, probably from the anxiety attendant on a first appearance, seemed hardly master of his resources; but as he warmed to his work he was heard to much greater advantage. His voice is a pure and a high tenor of excellent quality; he sings like an artist, has a good stage-presence, and his acting, if not remarkable, is graceful and unaffected. That he is a decided acquisition to Mr. Rosa's company there can be no doubt. As the young miller, Colas, Mr. Snazelle was thoroughly satisfactory; while Mr. Aynsley Cook, in the part of the bluff and kind-hearted Sergeant Bombardon, gave one of those highly-finished character-pictures in which this talented artist excels. Chorus, orchestra, and *mise-en-scène* were as irreproachable as usual, while numerous encores, supplemented by calls after each act for the composer, Mr. Rosa, and the whole of the principals, testified unmistakably to the entire satisfaction of the audience which crowded the theatre, and to the genuine success of the opera.

The *Golden Cross* and the *Merry Wives of Windsor* have been repeated during the week; and for this evening the *Bohemian Girl* is announced.

EBENEZER PROUT.

At the Crystal Palace Concert of Saturday last the name of another composer was added to the lengthy catalogue of those whose works have been first introduced to the English public through the medium of Mr. Manns's orchestra. Herr Carl Goldmark is scarcely known here even by name, though in South Germany he has a high reputation. He was born in 1832 at Keszthely, in Hungary, and received his musical education at the Vienna Conservatorium. Among his numerous works in many departments of musical art the *Ländliche Hochzeit*, *Symphonie in fünf Sätzen*, has gained, perhaps,

the most attention. The title of this work is, to say the least, unfortunate in its latter portion, as there is nothing symphonic in the form of the movements, and but little in the character of the music. The first section, *Hochzeitsmarsch mit Variationen*, at least shows the composer's mastery over the resources of modern orchestration. The air itself is neither remarkable nor original, but some of the variations are very clever, the scoring of each containing many novel and piquant effects. There is a delicate prettiness in the second movement, *Bräutlied*, and in the third, *Serenade*; but the fourth, *Im Garten*, is rather cloying, with its frequent repetition of one long-drawn melody. The last movement, *Tanz*, is a presto in common time, animated, noisily scored, and bordering on vulgarity. The work, as a whole, can scarcely be subjected to serious criticism. It is a *jeu d'esprit*, and considered in its true light deserves some praise. But it bears no nearer relation to a symphony than does an extravaganza to a tragic opera. The performance was remarkably good in all respects save one, where the direction in the score relative to the method of playing the cymbals was disregarded. The remainder of the concert may be briefly dismissed. Herr Joachim played Spohr's *Concerto Drammatico* and two movements from Bach's G minor sonata, while the orchestra was heard in the overtures *Coriolan* and *Fingal's Cave*, and in the air from Handel's opera *Scree*, so curiously arranged for solo violin, harp, organ, and tutti by Herr Hellmesberger, of Vienna.

CRITCHER's oratorio *Palestine* was fully discussed in the ACADEMY on the occasion of its first revival by the Sacred Harmonic Society in January, 1874. It is therefore unnecessary to refer to it at length at the present juncture. But mention may be made that Messrs. Novello, Ewer and Co. have recently added the work to their cheap octavo edition of oratorios, and it thus possesses a chance of renewed vitality. The performance on the last inst. at Exeter Hall was fairly commendable, allowing for the facts that Mr. Maybrick failed to render justice to the bass solos in the first part, and that the choruses were marred by the very feeble singing of the sopranos. It cannot be denied that this department of the Sacred Harmonic Society's forces needs careful revision. Miss Anna Williams sustained the whole of the soprano airs, and materially strengthened her position as an oratorio singer. She was assisted in the concerted music by Miss Julia Wigan, while Miss Julia Elton, Mr. Cummings, and Mr. Santley completed the list of principals.

THE second of Madame Viard-Louis' five grand orchestral concerts was given at St. James's Hall on Tuesday under the direction of Mr. Weist Hill. The programme was one of great excellence, including Bennett's charming overture to the *Naiades*, the "Jupiter" symphony, Bizet's orchestral Suite *L'Arlesienne*, a new minuet and trio (MS.) by Mr. Ebenezer Prout, and the march from Costa's *Elis*, as the orchestral numbers. In all these pieces the magnificent band, most ably conducted by Mr. Hill, was heard to great advantage; a finer rendering of the overture and the symphony has seldom been listened to. Bizet's Suite, announced as for the first time in London, has, we believe, been given at the Alexandra Palace; it is a work full of originality and of real beauty. Madame Viard-Louis was heard in Beethoven's E flat concerto and Mendelssohn's "Variations Sérieuses" to much greater advantage than at the previous concert; it may be fairly said that she played extremely well. Mr. Edward Lloyd sang "O 'tis a glorious sight" from *Oberon*, and Mendelssohn's "Garland," in his invariably finished and artistic manner.

THE Borough of Hackney Choral Association gave their third subscription concert of the season at Shoreditch Town Hall on Monday evening. The first part of the programme consisted of Beethoven's Mass in C, the solo parts being sung

by Mrs. Osgood, Mdlle. Hélène Arnim, Mr. Harper Kerton, and Mr. C. E. Tinney; to this succeeded Haydn's Military Symphony; and the concert concluded with Mendelssohn's music to *Loreley*, the solo part being magnificently rendered by Mrs. Osgood. Mr. Ebenezer Prout conducted.

On the 22nd ult. François Hunter, well known as a composer and arranger for the piano, especially of easy teaching-pieces, died at Coblenz, his native town, at the age of eighty-five years. During the greater part of his life Hunter resided at Paris; but he retired from the active practice of his profession some twenty years since, and returned to Coblenz, where he passed the remainder of his life.

THE Rev. D. Blakley writes:—"Permit me to notice one inaccuracy of some importance in the otherwise excellent *résumé* of a paper read by me before the Musical Association on February 4, published in the ACADEMY of February 16. The passage to which I desire to draw attention stands thus:—"It was stated that a cone cannot produce the harmonics of its fundamental in tune; and consequently the shape of a bugle," &c., &c. This should stand: 'It was stated that a cone can only produce the harmonics of its fundamental in tune when it is complete to its apex; a complete cone cannot be used by the lips as a wind instrument, and consequently the shape of a bugle,' &c., &c."

NOTES on MUHAMMADANISM. Second Edition, revised and enlarged. By the Rev. T. P. HUGHES, M.R.A.S., C.M.S. Missionary to the Afghans, Peshawar.

Opinions of the Press on the First Edition.

"Altogether an admirable little book. It combines two excellent qualities, abundance of facts and lack of theories. On everyone of the numerous heads (over fifty) into which the book is divided, Mr. Hughes furnishes a large amount of very valuable information which it would be exceedingly difficult to collect from even a large library of works on the subject. The book might well be called a 'Dictionary of Muhammadan Theology,' for we know of no English work which combines a methodical arrangement (and consequently facility of reference) with fullness of information in so high a degree as the little volume before us."—*The Academy*.

"It contains *multum in parvo*, and is about the best outline of the tenets of the Muslim faith which we have seen. It has, moreover, the rare merit of being accurate; and although it contains a few passages which we would gladly see expunged, it cannot fail to be useful to all Government employes who have to deal with Muhammadans, whilst to Missionaries it will be invaluable."—*The Times of India*.

"This small book is the most luminous, most convenient, and, we think, the most accurate, outline of the tenets and practices of Islamism that we have met with. It seems exactly the sort of comprehensive and trustworthy book in small compass, on this subject, that we and many more have often looked for in vain. The author has evidently studied his subject in a faithful, laborious, and scholarly manner, and has not only studied but mastered it. The work is of great value for general students, and for men whose work lies among the Muslim population, such as Civil Servants and Missionaries, it seems to be the very work that is wanted."—*The Friend of India*.

"It is manifest throughout the work that we have before us the opinions of one thoroughly conversant with the subject, and who is uttering no random notions. We strongly recommend 'Notes on Muhammadanism.' Our clergy especially, even though they are not Missionaries, and have no intention of labouring amongst Muhammadans or conversing with them, ought to have at least as much knowledge of the system as can be most readily acquired, with a very little careful study, from this useful treatise."—*The Record*.

"Its value as a means of correcting the common impressions about Islam will reveal itself to the most cursory reader, while the author's evident scholarship and intimate knowledge of his subject bespeak for him a patient hearing on points the most open to controversy."

Allen's Indian Mail.

London: W. H. ALLEN & Co., 13 Waterloo Place, S.W.

Now ready, 2 vols. 8vo, cloth, price 21s.

Advertised in error, on February 9, at 10s. 6d.

THE EVOLUTION OF MORALITY:

BEING

A HISTORY OF THE DEVELOPMENT OF MORAL CULTURE.

By C. STANILAND WAKE,

Author of "Chapters on Man," &c.

London: TRÜBNER & Co., Ludgate Hill.

Now ready, royal 8vo, price 25s., containing 64 Illustrations in Autotype, with Portrait of W. Hutton.

ILLUSTRATIONS OF FOSSIL PLANTS.

Being an Autotype Reproduction of Selected Drawings, prepared under the supervision of the late Dr. LINDLEY and Mr. W. HUTTON, between the years 1836 and 1840, and now for the first time published by the North of England Institute of Mining and Mechanical Engineers. Edited by G. A. LEBOUR, F.G.S.

Newcastle-on-Tyne: Published for the Institute by ANDREW REID, Printing Court Buildings. London: LONGMANS & Co.

Just published, 8vo, price 12s.

THE ROMANS OF BRITAIN. By HENRY C. COOTE, F.S.A.

London: F. NORGATE, 7 King Street, Covent Garden.

SATURDAY, MARCH 16, 1878.

No. 306, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The History of the Indian Navy (1613-1863). By Charles Rathbone Low (Lieutenant late Indian Navy), F.R.G.S., &c. In Two Volumes. (London: R. Bentley & Son, 1877.)

THE British Empire in India has the sea for its base; and from the time of the establishment of the first factory at Surat to the present hour the fundamental points bearing on the maintenance of our power have always been supremacy on the ocean and safe communication between England and her great Eastern dependency. The first voyages to the East undertaken by Englishmen are, therefore, subjects of primary interest to the student of Indian history, and the nature of our supremacy in the East cannot be fully appreciated without a knowledge of the naval annals of the East India Company. The earlier voyages, during the seventeenth century, secured for the Company a firm footing in India. They were led by some of the most able and intrepid seamen of the age of Elizabeth, and the record of their deeds is full of romantic incidents and adventures. The period of these early voyages is the heroic age of British Indian history, and it has never received its due share of attention. Meagre abstracts of the journals were inserted by Purchas in his *Pilgrimes*, whence they have been copied, in a still more abridged form, into subsequent compilations. Yet many of the journals themselves have been preserved in manuscript, and they form materials for a most interesting history of the heroic age of British India.

The first voyage of Sir Henry Middleton has alone been published in a separate form; and the voyages of Sir James Lancaster are about to be issued as one of the volumes of the Hakluyt Society's series. But the other journals of the East India Company's earliest sea captains remain in manuscript, at least those which have not been destroyed. An elaborate narrative of Sir Henry Middleton's second voyage by Captain Downton, the account of Captain Best's important voyage, and of his naval actions with the Portuguese, written by Ralph Crosse, the purser, and several others, are in the India Office. The manuscript of the story of the voyage of Captain Savis, in the course of which he opened intercourse with Japan, has found its way into the topographical dépôt of the War Office. Many precious manuscripts are lost. But ample materials remain for an exhaustive history of the early East Indian voyages, which are not only

important as having laid the foundations of our Indian Empire, but are rendered classic by the glorious deeds of some of our ablest Elizabethan navigators, and especially of two of our greatest Arctic voyagers. John Davis, after having piloted the first English and the first Dutch fleets to the Indies, ended his noble career in a naval action with the Japanese. William Baffin was killed while taking scientific observations on an island in the Persian Gulf.

In the journals of the old East Indian voyagers many curious pieces of information may be picked up, which are of general interest to men of letters. For instance, in the manuscript of Captain Keelinge's journal in 1607 one of the earliest performances of the play of *Hamlet* is recorded. We are told that while the ships were at Sierra Leone in June 1607 the commander ordered plays to be acted to amuse the men, and to keep them from dicing and idleness; and that the plays of *Hamlet* and *King Richard* were performed in presence of Captains Keelinge and Hawkins.

The second period of Indian naval history is not less interesting. It comprises the time when the ships and factories, especially on the west coast, had to be defended against the attacks of Mahratta pirates; and when a Bombay Marine had to be formed, in order that Englishmen might hold their own in the Eastern seas. The defeat of Angria's fleet by Commodore James, and the capture of Severndroog, is the most stirring episode in the history of this period, which, however, is full of deeds of gallantry and daring performed by the Company's naval servants; not only against local pirates, but in actions with the civilised enemies of England. Not the least glorious naval actions recorded in the pages of James and Brenton are that of Commodore Dance with Admiral Linois, and the capture of the *Medée* by Henry Meriton.

The history of the Indian Navy during the present century is a record of much valuable war service performed sometimes independently and at others in conjunction with the Royal Navy. In the Persian Gulf the labours of the officers of the Indian Navy, in destroying the nests of pirates, regulating the political relations of local chiefs, and preserving peace and order, have been of great permanent value, and have never been adequately recognised. Captain Felix Jones, the surveyor of the Red Sea and of Mesopotamia, the able Political Agent and gallant seaman, whose services in war and during peace have been of the highest order and extend over half a century, has never received the smallest honorary distinction. The almost total absence of recognition which has marked the conduct of our Government in its dealings with the officers of the Indian Navy renders their valuable services all the more honourable and patriotic. In the Burmese wars, at Aden, in China, in the Persian war, and during the Indian mutinies, a prominent part was taken by the local navy. Its officers and men earned that distinction which the conscientious performance of gallant deeds and good service confers, and which is independent of official requital.

But the work of the Indian Navy which

will be of most permanent value is comprised in their surveys in all parts of the Eastern seas, from the coasts of Africa to those of China. Surveying-work entails most laborious and trying duties, and calls forth the highest qualities of a seaman; and it is in this field that the officers of the Indian Navy have most eminently distinguished themselves. Their surveys were executed with very inadequate means and in the face of much official discouragement. But they were pushed forward to completion with admirable zeal and perseverance, and with great professional skill and ability. All surveys of the seas and coasts from Suez to Singapore are due to the Indian Navy; and for that service alone its officers deserve an honourable and lasting place in the annals of British domination in the East.

The abolition of the Indian Navy was a blunder from every point of view, and the false step must be gradually retraced. But the most serious mischief, and that which was most immediately felt, was caused by the total cessation of all surveys. In 1871 the resumption of marine surveys, which had been abandoned since the abolition of the Indian Navy, was strongly advocated by the Geographical Department of the India Office; and the representations then made led to the organisation of the present Marine Survey Department under the able superintendence of Commander A. D. Taylor, late of the Indian Navy. Most useful work has since been done, surveys have been executed and accurate charts prepared and published, and thus one part of the duties which were once so efficiently performed by the Indian Navy is provided for. The first General Report on the operations of the Marine Survey of India was issued by Commander Taylor in December 1876.

A naval history of our Indian Empire from the days of Lancaster and Best to the abolition of a local navy in 1863 was much needed; but the subject had never received that share of attention which its importance certainly demanded. Lieutenant C. R. Low, who has undertaken to supply this *desideratum* in our literature, has several qualifications for the task. He has already had some experience as an author, he is a conscientious and painstaking student, and his former position as an executive officer in the Indian Navy has imbued him with the traditions of the service, while it has given him special facilities for ensuring accuracy and completeness, especially in the latter part of the work.

The two volumes, of 550 pages each, which comprise Mr. Low's *History of the Indian Navy* leave nothing to be desired on the score of fullness of detail. No pains have been spared to present a thorough and complete narrative of every transaction relating to the naval service of the East India Company. Indeed, the defect of the work is that it is, perhaps, too much loaded with long extracts and quotations, not only in the footnotes, which are abundantly voluminous, but in the text. Thus the work, in some parts at least, is rather a collection of materials for history than a history in the exact acceptance of the term.

This is a defect; but it is counterbalanced by the merits of the work as a whole, and

we think that Mr. Low, who must have been embarrassed by the wealth and copiousness of his materials, has performed his difficult task very creditably. It was evidently a labour of love, and he has erred on the right side by searching out and preserving, sometimes perhaps in too much detail, all that redounded to the credit of the branch of the service to which he belonged.

The opening chapters, which are devoted to an account of the early voyages set forth by the East India Company, are disappointing. Mr. Low quotes Bruce, and even the very modern *History of India* by Beveridge. Both these writers merely copied from Purchas, while the original manuscript journals were accessible, if not to them, certainly to Mr. Low. But in the subsequent chapters there is evidence of careful research, resulting in the production of much new and very interesting information. The account of the remarkable career of Captain McCluer, the eminent surveyor who took the strange resolution of abandoning a successful career to settle among the savages of the Pelew Islands, is an example of such praiseworthy research. McCluer's story had never been fully told before, and was worth the telling. It is also to Mr. Low's credit that he allows no incident which would in any way increase the interest which attaches to his subject to escape him. Thus the wonderful but most truthful story of the loss of the *Ariel*, and of the almost miraculous escape of three of her crew, as told by Dr. Glen, one of the survivors, in a little pamphlet printed for private circulation, would probably have been forgotten if Mr. Low had not rescued it from oblivion. Such episodes certainly add to the interest of the work, and serve, in no small degree, to enliven its pages. The more important actions and other operations are narrated with clearness, and in a style befitting the subject, while the arrangement of the work leaves nothing to be desired. *The History of the Indian Navy*, by Lieutenant Low, deserves a place in every library beside the works of James and Brenton.

CLEMENTS R. MARKHAM.

North Italian Folk. By Mrs. Comyns Carr. Illustrated by Randolph Caldecott. (London: Chatto & Windus, 1878.)

THIS is a book about which the reviewer need not say much. It will go straight home at once to the hearts of all who love Italy—and how many lovers has not Italy already in our North? The key-note is struck in the first chapter: "the light is everywhere, and everywhere there is something to remember." Better words could not be penned to suggest what all upon whom has weighed *la fatigue du nord* seek in an Italian paradise of exiles. Unlike many books about Italy, this is written with full knowledge of her people and their ways. It describes a small piece of the loved land; but that piece—the Genoese Riviera, stretching southward to the bay of Spezia—is painted with the affection and with the mastery of one to whom it has been a home. All the *dramatis personae* of that enchanted country,

more full of illusions and of music than any theatre of London or Paris or Baireuth, are brought before us with simple but artistic touches. We recognise our old friend, *la fioraja*, in one chapter, and learn for whom she keeps her heart free from the compliments of counts and would-be fine gentlemen carrying their fortunes on their backs. In another we take a lesson in fashionable bargaining, studied from the life. In a third we are taught to sympathise with the labours of fishermen upon the waters. In a fourth we understand the almost autocratic influence of the *parroco* in his mountain village. In a fifth we take a peep into the lazy life and airy flirtations of Italian *villeggiatura*. And so on through a hundred scenes. To reproduce them here, or to quote the many fine touches which stamp these pictures with the authenticity of observation and experience, would be to do a work of delicate and sympathetic art the cruellest injustice. It is enough to thank both writer and artist, while rendering the higher meed of gratitude to the former, for a book which within a moderately short compass brings us close to people less known perhaps to Englishmen than are many of the savage tribes of Africa. No one who loves Italy, and wishes for insight into the habits of her village populations at the present time, should omit to read this charming book of Mrs. Comyns Carr. J. A. SYMONDS.

Growth of the Spirit of Christianity from the First Century to the Dawn of the Lutheran Era. By the Rev. George Matheson, M.A., B.D. In Two Volumes. (Edinburgh: T. & T. Clark, 1877.)

To give a clear and adequate account of the growth of the spirit of Christianity, from its first beginning to the days of Luther, is a task, it must be confessed, of the highest difficulty. To indicate in a couple of volumes the influences within and without the Church which, by a series of subtle and almost indefinable changes, first transformed the free and elastic teaching of the earliest ages into mediæval scholasticism and then again deposed the scholastic system from its place of pre-eminence, is no easy task. It would require for its adequate performance very uncommon learning, keen insight to discern the really efficient causes of change amid the crowd of insignificant events, and a concise and vigorous style to embody the results of investigation with the least possible periphrasis. It can scarcely be said that all these qualities are found in Mr. Matheson. His learning seems to be somewhat superficial, his style is florid and rhetorical, and we can discover in his work no remarkable acuteness or insight.

The fact is that when he set to work to picture the growth of the spirit of Christianity he was caught by that most misleading fancy of an analogy between the mental growth of a man and that of a community. Now, we might perhaps apply such an analogy without much strain to the natural history of a society of men from the time when they formed the ancient "kitchen-middens" to the time when they became a civilised people having liberal arts and laws. In such a case it is not an unnatural

metaphor to call the early state of such a society its "childhood," its civilised state its "manhood;" and it is no more than a metaphor: it does not help us in our investigation of its several stages. But it would be simply ridiculous to apply it in the case of a society founded by some well-known teacher in the midst of civilisation and in the full light of history. Who, for instance, writing the history of the great philosophic movement which took its rise from Socrates, would dream of taking Plato as the representative of the "child-life," Aristotle as the representative of "school-life," and Alexandrian Neo-Platonism—or perhaps the Platonism of Mirandola and Ficino—as the "manhood"? Yet this is very much what Mr. Matheson has done in his sketch of the great society founded by Jesus Christ. St. Paul and St. Augustine find their places in the "child-life;" the "school-life" appears to end with the Council of Constance; and then follows "the independence of youth." As this seems to end with the appearance of Luther, we conjecture that the period from Luther to the present day is the "manhood"—or are we already in the decrepitude of age? The bare statement of such a division of history is enough. An author naturally supposes that the age which has produced himself is the age of manhood; but St. Augustine or Thomas Aquinas might equally have imagined himself to be living in the manhood of the Church; and if a historian of the year 3000 were to hit upon the same crotchet, he would no doubt place the age in which we live at a much lower point in the scale of development than his own. Some writings of the present day which their authors no doubt regard as the greatest birth of time may perhaps then be classed with "the follies of youth."

Mr. Matheson's scheme by no means inspires us with confidence in his powers of treating so great a subject as the growth of the spirit of Christianity, and as we read we cannot but conclude that we have before us, not the condensed result of long study and careful thought, but slight sketches of certain portions of Church history interspersed with very fanciful reflections. The train of events which occasioned the great change of thought between the days of St. Paul and Luther, far from being made clear, is rather obscured by the fanciful framework in which the author has set his pictures, and the pictures themselves are altogether wanting in definiteness. The author has not quite made up his mind whether he is writing a history or a philosophical work for the use of those who already know the facts of history; the result is that the work is neither historical nor philosophical.

Mr. Matheson rightly sees that the state of the world at the time when Christianity appeared is a necessary factor in its history; and this "preparation for the Cross" in the world has, he thinks, "not received much attention." In this he is altogether mistaken. To say nothing of special works, such as Dollinger's well-known *Vorhalle zum Christenthum*, not a German handbook of Church history has appeared for many years past that does not contain a very much more

purpose-like account of the religious, philosophical, and political circumstances which influenced the rising Christianity than that which Mr. Matheson has given. But in truth his chapter on the "Preparation for the Cross" is not an account of the causes which rendered a certain portion of the world ready to receive Christianity at the time when it was first preached, but a very fanciful description of the qualities in certain ancient religions—some of which only came into contact with Christianity at a comparatively late period—for which, he thinks, some answering qualities are found in Christianity: "reason is given to China, imagination to India, understanding to Egypt, and will to Persia. With Greece there begins the reconciliation of that which was destroyed; and at length in Christianity the reconstruction is complete, and the human race resumes its original position as a united and harmonious family" (p. 19). We wonder that he could have written this last sentence without reflecting that, after eighteen hundred years of Christianity, the human race is very far from being a "united and harmonious family." The utterly fanciful assignment of qualities to the several nations must be obvious to every one; why on earth are we to give "reason" to China and "understanding" to Egypt?

A fair specimen of Mr. Matheson's treatment of the history of the Church itself may be found in what he says of Gnosticism (pp. 133, ff.):—

"Gnosticism is commonly held to have been a system, or series of systems, constructed in opposition to Judaism; but in truth we cannot, without qualification, subscribe to such a view. What Gnosticism did oppose was neither Judaism nor Gentilism, but empiricism, whether Jewish or Gentile. It was directed against the devotion to the external, in whatever form that might manifest itself. . . . Its nature may be summed up in a single phrase—the pursuit of the ideal. . . . It is soon apparent to calm reflection that, in studying the Gnostic teachers, we are standing in the presence of men whom chronology alone prevents from being the most subtle thinkers of any age, and whose thought is only crude because, in accordance with its stage of childhood, it is enveloped in a sensuous form."

We really have not met with any of those who hold that Gnosticism was "constructed in opposition to Judaism." It represents, no doubt, a system unfriendly to Judaism, but there is not the least reason to believe that any Gnostic system was deliberately "constructed" to oppose it. For "the pursuit of the ideal" we would suggest "a fondness for the most fantastic, baseless, and sometimes monstrous imaginings in preference to the sound teaching which makes for righteousness." Nor can we admit that "chronology alone prevented them from being the most subtle thinkers of any age;" they were not shut up in a corner of the world in the midst of infantile thinkers; what compelled them to adopt or invent interminable cosmogonies in the age of Antoninus Pius and Marcus Aurelius? We must confess that we can discover in their clumsy schemes no trace of subtlety. In fact, we have here an excellent specimen of the misleading influence of Mr. Matheson's theory; men who lived in the second century must needs be "in a stage of childhood,"

while in point of fact it was not the age in which they lived which hindered them from being philosophers, but a propensity to explain the mysteries of the world by grotesque hypotheses—a propensity which has been a bane of religion in all ages. That the controversy which was occasioned by Gnosticism gave a great impetus to intellectual life in the Church is probable enough; but we can by no means admit that the Gnostics themselves were the friends of culture and morality as opposed to formalism.

Mr. Matheson makes odd blunders in small matters which seem to show that he is not an accurate student. An *erratum* gives us a specimen of this at the outset—for "Council of Prague," read "Council of Brague." Unfortunately, the correction still needs correcting; it should be the sixteenth of the canons re-enacted at the first (sometimes called second) Council of Braga; and, as to the matter cited, to say that suicides were "deprived of spiritual intercession" is to give a very vague rendering of "nulla pro illis in oblatione commemoratio fiat." Probably the explanation is that Mr. Matheson took his information, as well as the form "Brague," from some French book. When Gregory VII. was besieged by Henry IV. in Rome, we read (vol. ii., p. 70) "the Holy Roman Empire defended itself with a bravery which . . . puts the old secular Empire to shame." To ordinary apprehension the Holy Roman Empire, or so much of it as followed the Emperor, was attacking, not defending; but we fear that Mr. Matheson supposes the Holy Roman Empire to be a synonym for the temporal sovereignty of the Pope. At the time of the Reformation the Continent "was governed by two despotic sovereigns—the King of France and the Emperor of Germany;" surely Francis I. could not say "I am the State," and Charles V., scarcely an absolute master in his own dominions, was very far indeed from being despotic as emperor. We are told (vol. ii., p. 252) that in Wiclif's time the peasantry had been "raised into enthusiasm by the publication of an anonymous work called *Piers the Ploughman*;" we should have thought that in these days most men of fair education knew that the writer of *The Vision of William concerning Piers Plowman* was named Langland. Wiclif (p. 255) instituted "the order of the Lollards;" Wiclif instituted no order—unless we call his "Poor Priests" an order—but his followers were nicknamed "Lollards" by their scornful opponents.

But it is not worth while to dwell on details. We are everywhere met by the same faults—fancifulness and want of accurate knowledge—and this in a region where accuracy and sound judgment are especially required. It is a mistake into which several writers have fallen to suppose that accuracy is not to be looked for in a general sketch.

S. CHEETHAM.

SWALLOW FLIGHTS.

Swallow Flights. By Louise Chandler Moulton. (London: Macmillan & Co., 1878.)

In these days of imitative art it is refreshing to meet with a volume like the present. Mrs. Moulton is an American lady; the fact that her work shows no special influence

of either American or English literature is therefore in itself some proof of tenacious originality. The distinguishing qualities of these poems are extreme directness and concentration of utterance, unvarying harmony between thought and expression, and a happy freedom from that costly elaboration of style so much in vogue at present, through which lyrical spontaneity cannot penetrate. Yet, while thus free from elaboration, Mrs. Moulton's style displays rare felicity of epithet. Two poems, entitled respectively "Morning Glory" and "Out in the Snow," are, for instance, brilliant specimens of word-painting. The first, a description of summer sunrise, has in it the very breath and voice of dawn, the strength and freshness of glad awakening life; the second, which paints a winter morning, has all the keenness, yet all the exhilaration and glory of frosty air and of sunlight upon snow.

These examples, with others equally healthy in tone and vigorous in execution, show that when Mrs. Moulton writes sadly, her sadness is not of necessity, is neither sentimental nor artificial, but only the natural outcome of a nature equally sensitive to pleasure and to pain, and endowed with unusual capacities for enjoying or suffering. Nor is her melancholy merely that self-reference. As a rule, it has its source in sympathy with man in general, and takes tender note of the perplexities and sufferings which belong to his condition. Thus the following lines express, with the directness we have already praised, feelings which must be common to all who have known the first bitterness of irreparable loss:—

"Dear and blessed dead ones, can you look and
listen
To the sighing and the moaning down here
below?
Does it make a discord in the hymns of Heaven—
The discord that jangles in the life you used to
know?
When we pray our prayers to the great God above
you,
Does the echo of our praying ever glance aside
your way?
Do you know the thing we ask for, and wish that
you could give it—
You whose hearts ached with wishing, in your
own little day?
Are your ears deaf with praises, you blessed dead
of Heaven,
And your eyes blind with glory, that you cannot
see our pain?
If you saw, if you heard, you would weep among
the angels,
And the praises and the glory would be for you
in vain."

The poetical faculty of the writer is in no way more strongly evinced than by the subtlety and suggestiveness of her ideas. In a poem where she speculates on what may be the condition of men and women after death, she speaks—

"Of the deep grave's delights,
Where through long days and nights
They hear the green things grow—
Cool-rooted flowers that come
So near to that still home,
Their ways the dead must know—
And shivers in the grass,
When winds of summer pass,
And whisper as they go
Of the mad life above,
Where men like masquers move;
Or are they ghosts—who knows?—

Sad ghosts who cannot die,
And watch slow years go by
Amid those painted shows?"

This intimate association of the dead with the mysterious and hidden life of nature is an idea which could only have occurred to a true poet. Not less imaginative is the fancied confusion of life with death in which both become equally unreal and phantasmal.

These poems have another and rare merit, with all their imaginative force: they are pervaded by the depth and sweetness of perfect womanhood, and entirely free from that trick of mannishness into which intellectual women are sometimes betrayed. Indeed, if we except Miss Christina Rossetti's incomparable "Goblin Market," we can recall no recent poems to which this special praise is so eminently due. They reveal at times the strength of passion, but it is always passion transfigured by love. Sometimes the feminine nature asserts itself by a mournful irony, subtle as the most delicate aroma. Take an instance:—

"If on my grave the summer grass were growing,
Or heedless winter winds across it blowing,
Through joyous June, or desolate December,
How long, sweetheart, how long would you remember—

How long, dear love, how long?

For brightest eyes would open to the summer,
And sweetest smiles would greet the sweet new-comer,

And on young lips grow kisses for the taking,
When all the summer buds to bloom are breaking—
How long, dear love, how long?

To the dim land where sad-eyed ghosts walk only,
Where lips are cold, and waiting hearts are lonely,
I would not call you from your youth's warm blisses,

Fill up your glass and crown it with new kisses—
How long, dear love, how long?

Too gay in June you might be to regret me,
And living lips might woo you to forget me;
But ah, sweetheart, I think you would remember
When winds were weary in your life's December—
So long, dear love, so long."

We have but brief space to speak of the sonnets. They are excellent in construction as in spirit, and afford perhaps a closer insight than the remaining poems into the writer's personality. Seldom has the happiness of newly-risen love—or that incredulity of happiness, as natural as the incredulity of sorrow—been more finely expressed than in the opening sonnet:—

"When the great sun sets the glad east aflame
The lingering stars are swiftly put to flight,
For day, triumphant, overthrows the night
And mocks the lights that twinkled till he came—
The waning moon retires in sudden shame,
And all the air, from roseate height to height,
Quivers with wings of birds that take the light
With jubilant music of one tender name.
So Thou hast risen, now, who art my day,
And every lesser light has ceased to shine—
Pale stars confronted by this dawn of thine
Like night and gloom and grief have passed away;

And yet my bliss I fear to call it mine
Lest fresh foes lurk with unforeseen dismay."

In her next volume Mrs. Moulton would do well to give us more variety in metre, and to overcome an obvious weakness for alliteration. There are undoubtedly occasions when its "artful aid" may render good service; but its frequent and needless employment tends to weakness rather than significance.

This volume will appeal primarily to poets; but its unstrained, simple beauty of thought and expression will surely win for it a far wider audience.

PHILIP BOURKE MARSTON.

The Dickens Dictionary: a Key to the Characters and Principal Incidents in the Tales of Charles Dickens. By Gilbert A. Pierce. With Additions by William A. Wheeler. (London: Chapman & Hall, 1878.)

To have a Concordance of an author's works, not merely compiled by some enthusiastic admirer, *homo unius scriptoris*, if not *libri*, but actually tendered, and that successfully, to the general public for purchase, is a distinction which extremely few modern writers have attained. All the chief Latin authors of the classical era have, indeed, been equipped with nearly exhaustive indexes, of which Ernesti's *Olavis Ciceroniana* is perhaps the leading example, but English Concordances are rare, and have hitherto been confined to a very few poets. Charles Dickens is the first prose writer to whom the distinction has been extended, and that when John Milton, Jeremy Taylor, Oliver Goldsmith, and Edmund Burke, to cite no others, are still without it. No better proof of very wide popularity can be offered; and, though the literary utility of the work is by no means equal to that of an index to some great thinker's writings, and it is of much less importance to know who "Shiny William" was than how to light on an aphorism of John Stuart Mill's, yet no such labour is quite thrown away, and, if no one else be found to commend the labours of Messrs. Pierce and Wheeler, they are sure to be blessed by the framers and solvers of double acrostics, who will find a treasure of puzzles in the obscurer books here indexed.

The plan of the work is as follows:—First comes an alphabetical catalogue of Dickens's works, with their dates, from January, 1834, when the first of the *Sketches by Boz* appeared, till the publication of the last number of *Edwin Drood*, in 1870. Then each book is taken separately, in the order of issue, and an outline of the plot, succeeded by a full list of its *dramatis personae*, with explanatory definitions, sometimes running to the length of several lines, is set out. Wherever one of the more celebrated characters occurs, a long extract, chosen to give a salient example of the peculiarities assigned it by the author, succeeds the definition; and sometimes passages intended to exhibit the general style are selected also. Thus, under *Pickwick*, we have part of the Chatham review; the drive to Dingley Dell; part of the Eatanswill election; the day out shooting in Captain Boldwig's grounds; the trial of *Bardell v. Pickwick*; Mr. Winkle's duel; and various paragraphs touching the two Messrs. Weller. And the account of each longer story is closed with a table of contents of the principal incidents in each chapter. When the last of the minor reprinted pieces has been treated in the main volume, there is added a catalogue, classified according to social position, of most of the classifiable personages whose names have occurred, and the whole book ends with a complete index of proper names, amount-

ing, according to an estimate in the Preface, which we have not been at the pains to verify, to more than seventeen hundred and fifty entries. Some of the minor writings thus analysed are of such very small interest even now that nothing short of veritable enthusiasm can have induced the compilers to include them. Such are that very poor satire, the "Mudfog Association," and not a few of the mere "pot-boilers" among the reprinted pieces; but they help the completeness of the volume. It is not, however, a perfect Concordance, nor is it possible that it should have been made so without indefinite increase of bulk, even had the long extracts, which do not seem quite in place, been retrenched. The brief descriptions and definitions are not always happily worded—a fault common to *Noted Names of Fiction*, another book of reference compiled by one of the partners in this undertaking—and there is no attempt at all at making an Index of Ideas. Thus, if anyone wish to find out readily what opinions Dickens expressed at any time as to war, or education, or social usages, and such-like subjects, he will get no help whatever from the *Dickens Dictionary*; but as Charles Dickens holds his place among English novelists, not by any such tenure as George Eliot's or Thackeray's, but mainly as a delineator of characters marked by some eccentricity or grotesqueness, this defect is not likely to be seriously felt, and we may thankfully take the goods afforded us. A more serious fault, but one which the limitations of the title-page do not allow the reader fairly to blame, is that the book is no help at all for verifying quotations, or for assigning any phrase to its speaker: so that it will not, for example, enable anyone to find whether Sam Weller, Mark Tapley, or Dick Swiveller is to be credited with some familiar saying. A collection of the most noteworthy passages of the sort would be of much more value than the imperfect classified index mentioned above, which would be useless even if complete, and might be wisely omitted, if space be needed, from the next edition.

RICHARD F. LITTLEDALE.

HISTORY OF ARAB CIVILISATION.

Culturgeschichte des Orients unter den Chalifen. Von Alfred von Kremer. Band II. (Wien: Braumüller, 1877.)

(Second Notice.)*

TURNING to the second of the two classes into which we have divided Herr von Kremer's chapters, our attention is instantly seized by the essay on Arab poetry (viii.), an interesting and tolerably full account of the characteristics of ancient Arab song, and its gradual change and eventual disappearance under the Khalifs. The earliest poetry is precisely what one would be led to expect from the surroundings of the people. Far from the trouble of the world, barred by wild wastes from the stranger, the Arab lived the free, careless, happy life of a child, enjoying to the uttermost the good the gods had sent him, delighting in the face that Nature showed him, inspired by the glorious breath of the deserts that were

* See ACADEMY, February 2, 1878.

his home. His poetry rings of that desert life. It is emotional, passionate, seldom reflective. Not the end of life, the whence and the whither, but the actual present joy of existence was the subject of his song. Vivid painting of nature is the great characteristic of this poetry: it is natural, unpolished, unlaboured. The people's life is another frequent theme—the daily doings of the herdsman, the quiet pastoral life, on the one hand; on the other, the deeds of the chiefs, war, plunder, the chase, wassail, revenge, friendship, love. Then, too, there were satires on rival tribes, panegyrics on chiefs, laments for the dead. This oldest poetry may be described as wholly objective, artless, childlike.

"Just as the language knows but the present and the past, so the ancient Arab lived but in to-day and yesterday. The future is nought to him: he seizes the present with too thorough abandonment to have an emotion left for anything beyond. He troubles himself not with what fate the morrow may bring forth, he dreams not of a beautiful future—only he revels in the present and his glance looks backwards alone. Rich in ideas and impressions, he is poor in thought. He drains hastily the foaming cup of life, he feels deeply and passionately; but it is as though he were never conscious of the coming of the thoughtful age which, while it surveys the past, as often turns an anxious glance to the unknown future, to guess what shall be allotted to the coming race."

With the establishment of Islam this old poetry came to its end, at least in the towns and cities; it still lived for a time in the mouths of the people and at the camps of the still-conquering armies. But the order of things was changed, and it could no longer be the natural outcome of the poet's life. The old war-songs, the wild nature-painting, gave place more and more to the soft theme of love, to the praise of wine and debauchery, and to a sentimental tone absolutely foreign to the strong fervid poetry of the older Arabs. The new poetry smacked of the contemptible Court of Damascus; it had lost much of the nobility of its ancestry. The vanity and luxurious idleness of the "Omniade" Khalifs led them to maintain poets-laureate, who were called upon to write laudatory odes to the Prince of the Faithful and to amuse him with their songs. Such work does not fit in with the poet-nature. The Khalifs, as a result, kept not poets but a set of rhymesters, who could turn a graceful couplet on the spur of the moment and endeavoured to atone for the want of *Geist* by the refinements of art. They sought out rare words; they arranged complicated metres; in fact, they did their very best to manufacture themselves poets; but they failed—not, however, in popularity, for the Court delighted in word-playing and elegant conceits. But there were still men who had not utterly lost the fine spirit of the older poetry. Indeed, contact with higher civilisations and the enlargement of ideas resulting from that contact and from the changed position of the Muslims, seems to have exercised a remarkable influence on some rare minds. In a few of the later schools of poets we find something of the naturalness and simplicity of the older poetry combined with the thoughtfulness and earnestness which could only come after

the spread of the nation. We have types of two classes of men in Abū-Nuwās and Abū-l-'Atāhiya, whom Herr von Kremer would have the Heine and Rückert of the Arabs. Abū-Nuwās is the courtly poet, the man of wine and slave-girls, the genius of the drinking-bout, the universal sceptic, caring for nothing but "Eat, drink, and be merry, for to-morrow we die." His poetry is full of brilliant fantasy, light satire, charming turns of grace. He is the genial singer of the upper ranks. Abū-l-'Atāhiya is very different. He speaks to the people; his poetry has something of the grave simplicity of the older poets; he is earnest, thoughtful, sorrowful, stirred by the spirit of chivalry and honour that inspired his forefathers, but which had now nearly vanished from the nation. Moved by the misery he looks upon, he is the voice of the oppressed people against the Court and its favourites. But such poets are rare in Muslim history; two only followed Abū-l-'Atāhiya—one was Abū-Firās El-Hamdāni, whose ode to his mother is perhaps the most beautiful piece quoted in this book; and the other the philosophical poet, El-Ma'arri. Most poets, like El-Mutanebbi, followed the tendency to exaggeration, to word-playing, to searching out obscure words—in fact, to providing work for commentators.

"After El-Ma'arri [c. A.D. 1000] no great Arab poet stepped forth: there were word-artificers, more or less clever verse-smiths; but true poetry, the free dauntless flight of the unfettered spirit, ever striving after new paths, was gone. The literary downfall went hand in hand with the social and political" (p. 395).

In chapter ix. Herr von Kremer reviews the whole range of Arabic literature under the khalifs. It need not be said that one chapter, even of one hundred pages, is too short a space for so wide a subject. The earliest literature was, as might be expected, theological and grammatical; the former to keep pure the faith, the latter to preserve the "perspicuous Arabic tongue" of the Kurān. Disputes on both points had early arisen. The free discussion permitted at Damascus between Christians and Muslims had led to some slight heresies: political differences among Muslims had created great schisms; and a very considerable and sufficiently bitter polemical literature was the result. Herr von Kremer's account of the works of the theologians, the traditionists, the commentators, the grammarians, lexicologists, and scholiasts on the poets, is, we must say, exceedingly inadequate. The subject is doubtless a dull one; but it is too important a part of Arabic literature to be lightly passed over. His account of the historians is much better, and we are glad to see that he estimates the Arab writers as highly as they deserve, and evidently has no sympathy with the vulgar notion that an Oriental cannot be an historian. Herr von Kremer's notices of Ibn-Kutaybeh, El-Belādhury, El-Hamdāni, El-Mes'ūdy ("the Herodotus of the Arabs"), and El-Birūni, the leaders of the elder school of historians, though too brief, are pointed and clear, and will give some idea of the merits of the Arab writers to the general reader: the Orientalist, of course, knows these great works as his constant helpers. Perhaps the most interesting part

of the literary sketch is the account of the geographers. There are few things more remarkable in the history of Arab literature than the enormous diligence and activity of these men. The taste for travel, encouraged by the Pilgrimage and by the necessity of visiting certain divines learned in the law, in order to study at their feet and acquire a knowledge of the traditions and decisions, added to the natural restlessness of the original Arab character, set men travelling over the whole Mohammedan world collecting notes with an industry unsurpassed. Herr von Kremer's accounts of El-Mukaddes and Yākūt are well worth reading. We have not space to follow him through his history of Arab science, the translations of Greek and Indian books, Khuwārezmy's Algebra (the source of algebra in Europe), the advance made in geometry, spherical trigonometry, optics, astronomy; the state of medicine; the knowledge of botany, mineralogy, zoology, and the rest. Everyone knows that Europe owes her early scientific knowledge almost wholly to the Arabs; but, as someone has said, it is a debt universally admitted and always ignored. Those who forget it will do well to read Herr von Kremer's section on the subject. We can only refer to it here; nor can we do more than mention the very meagre section on Arab logic and philosophy, the account of prose literature, and the notices of Muslim libraries. As a whole, chapter ix. is interesting but unsatisfactory. It is far too slight; and it lacks the only quality that could atone for slowness—it is not connected. It is a collection of literary statistics, not a history of literature.

We must pass over the chapter on Trade, and briefly notice the conclusion—"Die Ursachen des Verfalles." The causes of the downfall of the Arab empire Herr von Kremer justly finds in the gradual disintegration of the State, the oppression of the poor by the rich, and the loss of national feeling in the mixture of races. The destruction of the centralising principle by the springing-up of dynasty after dynasty on the skirts of the empire, their approach nearer and nearer to the khalif's capital, and the admission of Turkish mercenaries as a body-guard to the Prince of the Faithful, were sufficient reasons for the political overthrow. A kingdom weakened by the perpetual jealousies of rival dynasties, whose internecine wars spread destruction and wretchedness over the land, could ill withstand the onslaught of the invading Mongols. The people were heartily sick of governors who only looked upon them as proper subjects for extortion, and who made use of their courage only in fighting against their fellow-countrymen. The national feeling of the settled Arab was gone; he had intermingled too closely with other races to keep much of the old nature about him. He was too bitterly oppressed, too insecure of his very life, to care about helping his present tyrants against invaders whom he could scarcely believe worse than the invaded. Hence the kingdom divided against itself fell; and with it fell that literature and learning which had long been the admiration of the world. Herr von Kremer gives a terrible list of plagues and famines, and we cannot but accept his account of the extreme misery

of the people as no whit exaggerated. So long as the rulers of Islam are what they have hitherto been, the kingdoms of the Muslims must perish.

On the whole we are disappointed with Herr von Kremer's *Culturgeschichte*. Several of the essays in it are well written, but though it may perhaps pass as a *Geschichte*, it is not what the English call a *History*.

STANLEY LANE POOLE.

NEW NOVELS.

Miss Misanthrope. By Justin McCarthy. (London: Chatto & Windus, 1877.)

Children of Nature. By the Earl of Desart. (London: Tinsley Brothers, 1877.)

Ida Milton. By Graham Stephenson. (London: Tinsley Brothers, 1877.)

Thomas Brown's Will. By Adolphus Pohl. (London: Tinsley Brothers, 1877.)

MR. JUSTIN MCCARTHY is, on the whole, a disappointing sort of a writer. He is so clever and so careful that we are led not only to expect a great deal from him, but to get so much that it becomes an injury to us that we should get no more. The intention of his characters is always so just and right, their execution is always so thoroughly well *motivée*, there are so many sparklets in the way of phrases, sentences, speeches even, about them that the book in which it all occurs seems continually on the point of being quite excellent. This quality it never actually attains to, either as a whole or in detail. The final impression, therefore, is one of disappointment, but of disappointment mingled with respect. The author, it is easy to see, is not of right athletic stuff; but his weakness has been so well and subtly trained, and he knows the measure of himself so exactly, that he shows for the moment in the ring to far greater advantage than rivals not a few who are much more vigorously endowed than himself. That there should be a slight savour of midnight oil about his pages is hardly, in these days of cheap thought and reckless handiwork, an unpardonable thing. The odour is, after all, of the slightest, and it is not now so common as to be anywhere offensive. Of all this *Miss Misanthrope* points the moral, and that not unpleasantly. It rejoices in a more distinctly individualised type of heroine than *Dear Lady Disdain*, but it is scarcely so good a novel. It is, however, a very creditable piece of craftsmanship in its way, and its dullness is only a matter of pages or chapters. It is bright and kindly; it is well apprehended and almost as well done; and there are evidences everywhere of a quite uncommon reticence and sobriety that are commendable indeed. The dialogue is unusually apt and plausible, if it is never strong with the strength of utter precision and truth. As was to be expected, it contains not a little caricature of the well-bred, thin, good-tempered order—of Du Maurier in words, as it were. And with many quiet felicities of phrase there is now and then a hint of something sufficiently like epigram to be exceedingly acceptable. As a story it counts for little. Mr. McCarthy has only velleities of plot; his function is to be, more or less guardedly, psychological. Some of his studies are successful enough—as, for instance, that of

Miss Misanthrope herself, who is gracefully and acutely imagined, and handled with a great deal of dexterity, and with something which, if not exactly force, is very much like it: as, to take a still happier example, that of Mr. Money (the name, by the way, is suspiciously suggestive of Brassey), whose portraiture seems to me quite the best thing in the book. The hero is a weakling, but he is well meant, and it is not possible to be hard on good intentions. As for the species of postaster who is made to be at once the fool and the villain of the drama, he is at best a poor, shambling, half-witted sort of creation, and one that cannot be approved of from any point of view whatever. The aptest sketch is that of the gifted lady who has to resign her blue china because her regard for it is imperilling the safety of her immortal soul.

If the Earl of Desart's intention, in writing *Children of Nature*, were the production of a work that should be a bad—a very bad—novel, and a disagreeable—a very disagreeable—book, it must be said that he has succeeded quite admirably. London society is in a very miserable way indeed, if what he has chosen to utter concerning it be true. Accepting his view of it, one is fain to confess that it deserves no better novelist than the one that in him it seems to have got. Society, as the Earl of Desart pictures it, is an agglomeration of all the smaller vices with a few of the more dubious virtues. To be within its pale is apparently to forfeit all claim to consideration from the outer world. Everybody is abominably loose, everybody is atrociously vulgar; everybody speaks the wretchedest English, and talks the nastiest nonsense conceivable; everybody is blessed with an ignoble soul and a set of traditions—moral, practical, and intellectual—that jump but too well with it. And that is all that can, or need, be said about them. The only good thing in the book appears to be a parody of Miss Broughton, which, in its way, is not lacking in spirit. All the rest, like the knight's honour, is emphatically naught.

It is to be conjectured that the Graham Stephenson who is responsible for *Ida Milton*: or, *To Be or Not to Be* is of the softer sex. It is barely possible to understand why she should have written *Ida Milton*, and it is altogether impossible to discover why she should have printed it. It is a wild work. *Ida Milton*, it seems, is under a curse. She falls in love at first sight with an idiotic Fellow of Merton, who reciprocates the feeling, but is prevented from giving it timely utterance by the warnings of a friend. *Ida* is naturally incensed, and goes forth to avenge herself upon the world of men. This she does with such striking success that in the course of a single chapter one aspirant is driven to bettering himself at a University; a second takes to drink so seriously as to die of it; a third expires of disappointment and a consumption; and a fourth, the only son of his mother, is led to seek and find a soldier's grave in the trenches before Sebastopol. All comes right in the end, of course, and the Fellow of Merton is at last allowed to marry *Ida*, and take orders, but not before such a quantity of nonsense has

been talked as is actually appalling. Here is a specimen: it is the idiotic Fellow of Merton who speaks, with reference, of course, to the ferocious *Ida*:—

"You do not know that snake-like she strove to twine her beauty and her fascination about my weakness, that she might sting me and delight herself with my writhings. You do not know that she has clung tremblingly to these arms, and dropped warm tears upon these hands, that she might draw my ignorant footsteps into her net, and then mock at my feeble and presumptuous credulity. But I was warned beforehand, and robbed her of her triumph."

Here is another, the human interest of which came home to the writer of these lines with a great deal of force:—"I shall be all right when I have got rid of these books, and had some tea." These words, which occur early in the second volume, are really prophetic. If *Ida Milton* were universally read their application would be universal too.

There is not much, saving a certain quality of extreme badness, which is noteworthy in *Thomas Brown's Will*, but there would seem to be a point or two of interest in the personality of its author. This gentleman, who is quite too evidently a German and a commercial person, appears to have taken himself so seriously as to have determined that he is capable of writing well and wisely *de omni re scibili et quibusdam aliis*. As a consequence he has taken the opportunity afforded by the evolution of a novel of indulging in the composition of an interminable series of essays, the dullness and pointlessness of which, as contrasted with their brevity, are little less than phenomenal. There is nothing like a human being in the book, and not the ghost of a story. It is a dreary dance of shadows, quite too inexpressibly tedious to be tolerable to anyone, even for the sake of its absurdities, which are glaring and manifold. W. E. HENLEY.

CURRENT LITERATURE.

Armenia and the Campaign of 1877. By C. B. Norman, late Special Correspondent of the *Times* at the Seat of War. (Cassell, Petter and Galpin.) Captain Norman landed in Armenia full of prejudices in favour of the Turks. Experience, however, not only modified, but completely reversed his ideas, and it is extremely interesting to follow the process by which this result was attained. Very conscientious, very active, and very observant, it is impossible not to feel that Captain Norman may be trusted. He possesses, moreover, the advantage of a military training and much previous acquaintance with Orientals, which circumstances add great weight to his testimony. Among other things, Captain Norman gives valuable information concerning the composition, organisation, pay, &c., of the Turkish and Russian armies. All soldiers are gathering as much as they can about the effects of modern rifles in action, and Captain Norman naturally chronicled all that he observed on that point. At the battle of Taghir he noticed some Turks opening at a distance of 1,500 yards. They paid, however, no attention to their sights, "firing wildly in the air, giving what elevation they considered necessary." They also wasted their ammunition most recklessly. In the middle of the action eight Turkish battalions defended a portion of the position.

"Very few of the enemy showed themselves, and these only at a distance of 800 yards. Yet a ceaseless rattle from the Henry-Martini told the tale that ammunition would soon run out unless the officers could restrain the men from such reckless waste of what

later on would be such priceless material; but instead of this the officers seemed to encourage them."

Notwithstanding this extravagance, one regiment at all events had gone into action with only fifteen rounds per man! At the battle of Zewin the Russians attacked the Turkish shelter-trenches ten times, each time with the utmost gallantry, but could never, so deadly was the fire, get within 200 yards of their object. As in Europe, the Turks and Russians showed great readiness on occasion to decide the issue with the bayonet. An instance of this was afforded on November 9, when General Heimann endeavoured at daybreak to carry Erzeroum by a *coup de main*. An advanced *lunette* was, indeed, captured by surprise, and the garrison made prisoners, but the Captain Pasha, taking the alarm, advanced with half a battalion of a newly formed regiment and discovered that the work was in the hands of the enemy.

"Without giving the matter a thought, he fixed bayonets, and straightway charged them. A sanguinary hand-to-hand fight took place inside, but such was the impetuosity of the onslaught that the Russians were fairly driven out of the work, not before they had removed the garrison, consisting of 20 officers and 500 men."

Of the scandalous misconduct of the Turkish Government with regard to the treatment of the sick and wounded Captain Norman speaks with generous indignation, and brings forward ample proof in support of his indictment. We cannot do better than conclude this brief notice with the following extract:—

"Armies without a single doctor are sent 100 miles from the nearest hospital, and sick and wounded men are left to drag their weary limbs as they best may to the nearest harbour of refuge; no preparations are made for their transport, no escort sent with them to obtain shelter or food at the various villages *en route*; they are left unprovided with money to procure themselves even the commonest necessities of life."

The Duties of the General Staff. By Major-General Broussard von Schellendorf. Translated from the German by W. A. H. Hare, Lieut. R.E. (C. Kegan Paul and Co.) Since the close of the Franco-German War, few military works have appeared which are more deserving of close and attentive study in this country than Von Schellendorf's account of the duties of the General Staff of the German Army, and Lieut. Hare has done good service in providing a translation for English readers. All that relates to the organisation and duties of a General Staff which has successfully conducted two such important campaigns as those against Austria in 1866, and against France in 1870-71, must necessarily be of deep interest to the military student; no one is better qualified to write on these subjects than the chief of the General Staff of the Guard Corps, and he treats them with a fullness which leaves little to be desired. A brief historical sketch of the development of the General Staff of the Prussian Army leads to a critical examination of the existing state of the General Staffs of other European armies. Great importance is attached to the independent position which the German General Staff occupies in the organisation of the army, and this circumstance is said to have been one of the principal causes of its brilliant achievements in recent campaigns. In England there is no Chief of the Staff and no "General Staff regarded as a special body of officers;" whether this be right or wrong—and, in this country, there is much to be said on both sides of the question—it cannot be denied that there is much truth in the argument (p. 28) that "the same person who is charged with the necessary preparations in time of peace, should be entrusted with the execution of the operations in war." The peace formation and administration of the German Army, as well as the office duties which fall to the lot of General Staff officers attached to army corps and divisions, are described

in great detail, and there are some interesting remarks on the German system of recruitment. The most important chapters of Von Schellendorf's book are, however, those devoted to "Manœuvres" and "Reconnaissances;" they are full of practical hints and suggestions, the result of many years' experience in peace and war, and no officer can read them carefully without adding something to his stock of knowledge. While cordially recommending Lieut. Hare's translation to the attention of officers of all branches of the service, we cannot help regretting that the publishers should have considered it necessary to fix such a high price for a work illustrated by no maps or diagrams.

The Essays of Montaigne. Translated by Charles Cotton. Edited by W. C. Hazlitt. (Reeves and Turner.) The plan upon which Mr. Hazlitt has proceeded in this very handsome edition of Montaigne is, we think, a little open to exception. He says in his Preface that the besetting sin of Florio and Cotton was a "propensity to reduce the language and phraseology of their author to the language and phraseology of the age and country to which they belonged." Now, in the first place, we venture to think that the sinfulness of this sin is a matter of some doubt. Literal rendering of work so saturated with peculiarities as Montaigne's is apt to be the greatest of all possible treasons, and though both Florio and "heartly, cheerful Mr. Cotton" undoubtedly took liberties at which our nineteenth-century translators would be aghast, it is very questionable whether they did not thereby achieve by the only way possible their end, which was, we suppose, to give the merely English reader as nearly as might be the same advantage as the French. Again, if Mr. Hazlitt was, on principle, dissatisfied with this proceeding, he should surely have translated the essays *de novo*, without reference to Cotton at all. However, he has not thought fit so to do, but has contented himself with correcting the infidelities of Cotton, and adding matter from the French edition of 1854. One thing he has done of the goodness of which there can be no doubt. He has verified and retranslated all the quotations which have usually, both in French and English editions, been in a very evil plight. The composite version is by no means bad of its kind, though it almost inevitably lacks raciness and character. We wish Mr. Hazlitt had adopted the useful plan more common in France than in England, of prefixing a competent critical Introduction to his book. A translation of Montaigne is almost necessarily addressed to a public which is by no means superior to such a thing, and the author is one of whom it is as well to have some general idea before sitting down to his study. However, such as the book is we are very glad to welcome it, and hope it will have a large circle of readers. These readers may, at any rate, comfort themselves with the thought that they have got the great essayist entire and ungarbled. A Bowdlerised and improved Montaigne is perhaps the most absurd of all such absurdities.

Dublin Doggerels, by Edwin Hamilton (Dublin: Smyth), are exactly what they very honestly describe themselves to be. Some of them are burlesque descriptions of places in or near the Irish metropolis; others are parodies or reminiscences of more serious poetry; and most of them are not below the level of the less good work in the old *Comic Almanacs*. Read separately in manuscript and by a select circle, they might not be unamusing, for the author is not destitute of a certain dry humour. Dryness, however, without body is apt to be a little wiry, and this, we must confess, is too often the case with these *Doggerels*. The last piece, moreover—a burlesque poem on "Ariadne," which appears to have obtained the Vice-Chancellor's prize at Dublin University—is decidedly below the not very lofty level of its fellows. The university of Swift and Moore would seem to have been rather hard-up for poetical youth when it decorated Mr. Hamilton.

MR. W. M. HALBERT, the author of *An Exposition of Economic and Financial Science* (Remington), has been unfortunate in his estimate of the qualities necessary for treating his subject. Political economy is a theme full of interest; but perhaps there is nothing which so imperatively demands clear language on the part of its expositors. This demand can hardly be said to be answered by an author who writes "among one of the most learned and able of our recent economists," "making their facts and opinions unexclusively his own," "to few are given that prophetic glance," "no one can but admire," and of whose sentences this may serve as a specimen:—"Complex as the enquiry into such a cause or con-causes must necessarily be, as the oscillations of so mutable a thing as credit must be ever oscillating between a positive and a negative pole, or from a maximum to a minimum stage or condition: still it is principally into this condition we wish to enter upon, and, if it is possible, give an exposition on this part of our subject, endeavouring to give an outline of those laws under which these phases appear as applicable to all time." Mr. Halbert's "part of his subject" is the doubtless interesting question of the recurrence in cycles of commercial depressions, &c. We cannot say that his collection of facts is at all exhaustive, or that his inferences from them are at all conclusively presented.

NOTES AND NEWS.

UNDER the title of *Tropical Nature*, Mr. Alfred Russel Wallace has in the press a new volume of essays, which will shortly be published by Messrs. Macmillan and Co.

A PAPER of Mr. Ruskin's, completed just before his illness, will appear in the *University Magazine* for April.

THE course of lectures recently delivered by Mr. R. Bosworth Smith at the Royal Institution on "Carthage and the Carthaginians" will very shortly be published by Messrs. Longmans in the shape of a connected History, with much additional matter, and with illustrations and many maps and plans.

WE hear that the Secretary of State for India in Council has subscribed for fifty copies of Mr. Low's *History of the Indian Navy*.

MR. W. T. THORNTON, C.B., has in the press a volume entitled *Word for Word from Horace*, being a literal versification of Horace's Odes. It will be published by Messrs. Macmillan and Co.

THE same publishers are about to add a volume of selections from the poems of Mr. Matthew Arnold to their well-known *Golden Treasury Series*.

CESARE CANTÙ, the *Rassegna Settimanale* states, is publishing three episodes of contemporary history—(1) *Monti*; (2) *Il Conciliatore e i Carbonari*; (3) *Manzoni*.

WE understand that Mr. J. A. Symonds, whose health has compelled him to establish himself for some time at Davos in the Grisons, is employing his leisure in printing a volume of original verse, which will be published by Messrs. Smith, Elder and Co.

MESSRS. WM. COLLINS, SONS AND CO. have in the press, and will publish shortly, an edition of *Bacon's Essays, I.-XXXI.*, with Life, Introduction, and Notes, by the Rev. Henry Lewis.

MESSRS. BELL AND SONS write to inform us that Mr. E. O. Beasley's translation of Lessing's *Laocoon*, lately referred to by a correspondent as out of print, will be included in an edition of Lessing's works which will shortly be added to Bohn's Standard Library.

WE understand that Mr. A. W. Bennett, Lecturer on Botany at St. Thomas's Hospital, is engaged on an introductory handbook of Cryptogamic Botany, to be published in the "Inter-

national Scientific Series;" and that he will be extremely glad of any recent original memoirs, English or foreign, bearing on any branch of the subject, which the authors may be inclined to send him.

ABOUT this time last year we noticed the commemoration of Johns Hopkins University, Baltimore, U.S. The *Baltimore Evening Bulletin* contains a full account of the proceedings which took place at the second of these anniversaries, on the 22nd of last month. Addresses were delivered by the President of the University, Professor Gilman, and by Professor Remsen, who fills the Chair of Chemistry. Our readers will not have forgotten that Johns Hopkins University was founded with the special object of securing a home for mature study and scientific research side by side with active teaching. It appears that the total number of students is still small, but that by means of the "Fellows" and "Seminaries" the intentions of the founder are already beginning to bear fruit. The speech of Professor Remsen gives a long list of the subjects, both in history and physical science, in which original work has been performed during the past year. We should like to quote at length from this Report, but space only permits us to observe that all the fellows or endowed students, twenty in number, "submitted to the faculty at the close of the academic year satisfactory reports of their perennial work." Of the value of their labours only a specialist in each case could speak. We could wish that the attention of the University Commissioners in this country were properly drawn to the success of this interesting experiment, in which the advancement of knowledge is regarded as the one supreme aim of academical life both among the Professors themselves and the elder students.

THE *Scholastic Register*, a monthly journal devoted to the interests of the scholastic profession, has recently passed into new hands. The current number, the first of a new series, is now before us. Besides various articles, some of which are contributed by well-known educationalists, it contains a full record of the various changes and other events that have taken place at the public schools and universities. But the specialty of the *Scholastic Register* is to be a series of examination papers adapted to the curriculum of the Oxford and Cambridge Local Examinations. The papers will be drawn up by gentlemen whose names will be appended as a guarantee of their authenticity.

THE number of candidates for election into the Royal Society has this year reached fifty-six, and the list was closed on the 7th inst.

THE second edition of Sir Joseph Hooker's *Student's Flora of the British Islands* will shortly be published by Messrs. Macmillan and Co.

MESSRS. GRIFFITH AND FARRAN announce *Commercial Products of the Sea; or, Marine Contributions to Food, Industry, and Art*, by P. L. Simmonds; and new editions of *Rosamond Fane* (by Mary and Catherine Lee); Mrs. Trimmer's *History of the Robins*; and *Granny's Story-Box*.

MR. THOMAS ARNOLD is preparing for the press a catalogue of his extensive collection of works on Tobacco, its Usages, Cultivation, Manufacture, &c., comprising upwards of five hundred separate works.

MR. BUCHANAN writes to us that he has no intention of severing his connexion with the *Contemporary Review*.

THE committee of the Index Society have had several specimens of MS. Indexes brought under their notice which are too extensive for their present purpose; but it is proposed to give some account of these in the Appendix to the society's annual Reports. One member has compiled an Alphabetical Index of the names of about 90,000 persons who have married members of families described in Dictionaries of the Peerage, Baronet-

age, and Landed Gentry; giving the dates of the marriages, the name of the person married, and other details. It is obvious that such a work would be of great service to all engaged in genealogical enquiry, as it gives information not otherwise to be obtained. The MS. is arranged in a tabular form; and from the first column all individuals whose names can be found in their alphabetical place in the Peerages are excluded. The figures (1), (2), &c., affixed to the names, indicate that the person in question was the first, second, or third husband (or wife) of the person named in the same line. Extinct titles are underlined.

PROF. MAX MÜLLER is to deliver the first series of seven "Hibbert Lectures" on the "Origin and Growth of Religion, as illustrated by the Religions of India." The lectures will be delivered at the Chapter House, Westminster Abbey, on successive Thursdays, beginning April 25, at five o'clock. Admission will be by ticket.

A HUNGARIAN translation of Prof. Max Müller's Strassburg lecture, "On the Results of the Science of Language," has just been published at Budapest, under the title *Müller Miksa, A nyelvudomány eredményei szerző jóváhagyásával fordította Edelspacher Antal*.

THE *Augsburger Zeitung* of March 8 gives a full account of Prof. Max Müller's review of Noire's philosophy published in the February number of the *Contemporary Review*.

THE American Philological Association, which includes most of the active students of language in America, has made two Reports on the reform of spelling. The last contains a scheme for thorough phonetic spelling, including some new letters, and some practical suggestions for introducing the new spelling to the public. These reports have been accepted, and papers in the *Transactions* of the Association may now be printed in the amended spelling. Some newspapers seem to have accepted the scheme, and the *Independent* has undertaken to publish a number of essays, on condition that they are to be printed according to the new style. Prof. F. A. March, the well-known Anglo-Saxon scholar, has given his adherence to the new scheme of spelling.

MESSRS. LONGMANS announce *The Philosophy of Reflection*, by Shadworth H. Hodgson, and *Conditions of Social Well-being*, by D. Cunningham.

THE Library of Harvard University is about to begin the issue of several bibliographical works, including Mr. Scudder's Catalogue of Scientific Serial Publications, of which the subscription is filling up; a brochure on the Sumner Collection, enumerating such books and manuscripts bequeathed to the library by the late Charles Sumner as have bibliographical or other curious interests; a bibliography of Michelangelo, with copious notes, prepared by Charles Eliot Norton, Professor of the History of Arts in the University; a catalogue of the collection of ballads and folk-lore in the library, which Professor F. J. Child has fostered for years, until it has become probably the finest in the world, and which will be annotated by the Professor; and a list of the bibliographical apparatus used in the catalogue department of the library, with notes on the particular scope and uses of the several books. This last will be prepared by Mr. Winsor, the librarian, and he will unite the experience derived from his present charge and his former one, the Boston Public Library, and will receive the co-operation of Mr. Cutter, of the Boston Athenaeum.

ON the 2nd inst., Dr. Friedrich Delitzsch, Extraordinary Professor at the University of Leipzig, who is known as the translator of George Smith's *Chaldean Account of Genesis*, and whose name is among the first in the small number of German Assyriologists, delivered his inaugural lecture on "Cuneiform Researches and the Bible." He holds

the first and only Chair of Assyriology in Germany, newly founded at Leipzig by the Saxon Government.

THE Geschichtsverein of the city of Luzern announces the forthcoming publication of an archaeological map of the Canton.

PROF. AYER, Rector of the Academy of Neufchatel, has been honoured with a gratifying distinction by the French Ministry of Public Instruction. His *Comparative Grammar* has been prescribed for the special study of the aspirants to professorships in the French Lycées.

THE *Nuova Antologia* for February contains a continuation of Prof. Malfatti's historical studies of the ninth century: under the title "An Episode of the Pontificate of Pope Nicolas I.," he gives us a careful sketch of the condition of the Roman Curia and of the political causes which influenced the attitude of Nicolas in the question of the divorce of Tidberga, wife of King Lothar. There is also the beginning of a study by Signor Zumbini of the *Africa* of Petrarch: the writer's object is to show that Petrarch's now forgotten poem was animated by his spirit of patriotism, and owed its popularity to its connexion with the movement which took shape in the rise of Rienzi.

THE *Rivista Europea* has a useful review by Signor Cosci of the progress of historical studies in Italy since 1859. Signor Bertolotti publishes the documents relative to the trial in Rome of the Abate Morandi, who was accused of astrology under Urban VIII.; they give a curious picture of the beliefs and practices current at that time. Signor Neri also publishes some extracts of great historical interest from the correspondence of Ferdinando Raggi, who was agent of the Genoese Republic at the Court of Rome from 1665 to 1669. Signor Ademollo collects notices of the circumstances attending the deaths of the Popes during the present century: he does so for the purpose of contrasting them with the death of Pius IX., so as to show how much more comfortably and decorously a Pope can die now that he has lost the temporal power.

WE are glad to see that the publishing firm of Brigola at Milan have undertaken the work of issuing an index to Muratori's great collection, *Rerum Italicarum Scriptores*. The index is to be a folio volume of 1,000 pages, and is to harmonise as much as possible in print and paper with the original volumes. There are to be four indexes—one of names of persons, another of institutions, a third of places, and a fourth of documents. The value of such a work as this to students, if it be carefully done, is incalculable, and the industry and zeal which is always displayed in Italy in all historical work leads us to expect that it will be conscientiously compiled.

THE *Deutsche Rundschau* for February has an article by Paul Heyse on Giacomo Leopardi, who is treated as the poet of pessimism, and is gently ridiculed for the inconsequence which, in common with all pessimists, he shows when it comes to be a question of his individual worth, importance or enjoyment. In the *Deutsche Revue* Herr Bahringer criticises Mr. Herbert Spencer. He points out that Mr. Spencer regards the world as the product of an absolute power, yet insists that this power is hidden in spite of its manifestation: he also objects to Mr. Spencer's attempt to reduce the psychic and moral part of man to a level with the physical, and contends that in professing to resolve one into the other Mr. Spencer really assumes the question.

OBITUARY.

ITALY has to regret the loss of one of her most accomplished jurists and statesmen, Count Paul Frederick Sclopis di Salerano, a native of Turin, in which city he died on the 8th inst. Born in 1798, he distinguished himself at an early age in the university of his native city, and was

nominated in 1825 to an office under the Minister of the Interior of the Kingdom of Sardinia. Thence he passed into the career of the Magistracy, and was appointed a member of the Senate of Piedmont, at that time the Supreme Court of Justice. He filled subsequently the office of President of the Superior Commission of Censure, 1847; became Keeper of the Seals and Minister of Justice and Ecclesiastical Affairs in 1848, at which time he sat in the Piedmontese Chamber as deputy for Turin. In 1849 he was called to the Senate, of which he became Vice-President. Meanwhile, Count Sclopis had taken part, in 1837, in compiling the Civil Code of Sardinia; as Keeper of the Seals, in 1848, he had presided over the Commission upon the Laws of the Press, and, as President of the Council of Contentious Diplomacy, he had taken an active part in the debates touching the seizure of the *Cagliari* by the Neapolitan Government. His last diplomatic function was to represent the King of Italy in 1872, as one of the arbitrators at Geneva between the Governments of Great Britain and of the United States of America on the so-called *Alabama* question. Count Sclopis has also earned for himself a distinguished place among men of letters. His earliest publication was the *History of the Ancient Legislation of Piedmont* (1833), which was followed by his *History of Italian Legislation*, in three volumes, commenced in 1840 and completed by him in 1857, and which has been re-edited by him at Turin in 1864. In 1851 he published an *Essay on the States-General and other Political Institutions of Piedmont and Savoy*, and in 1853 his *Historical Researches into the Political Relations between the Dynasty of Savoy and the British Government*. He was President of the Academy of Turin since 1864, member of the French Academy of Moral and Political Sciences since 1869, Member of the Institute of International Law since its foundation at Ghent in 1872, and also Honorary President of the Association for the Reform and Codification of the Law of Nations since its foundation at Brussels in the same year. He had received from his sovereign the highest mark of his favour in being nominated a Knight of the Order of the Annunziata in 1868. His duties as a member of that order, which required his presence at Rome at the interment of the late King, the founder of the Italian monarchy, may have contributed to shorten his life, which, although it has been prolonged beyond the usual limits of "the days of man," had not ceased to be valuable to humanity, while it has been terminated too soon for his numerous friends among men of letters, who found at all times a cultivated society and a sympathetic welcome in his hospitable mansion at Turin. TRAVERS TWISS.

MR. CUTHBERT WILLIAM JOHNSON died at Waldronhyrst, Croydon, on the 8th inst. He was born at Widmore House, Bromley, Kent, on September 28, 1799. Though not bred in the practical pursuit of agriculture, he devoted himself from an early period in his life to furthering its scientific study, and published a very large number of volumes of the highest value to those engaged in cultivating the soil. The most important of his works on this subject was *The Farmer's Encyclopædia and Dictionary of Rural Affairs* (1842); this was followed in 1845 by *The Farmer's Medical Dictionary*. His pamphlet entitled *Observations on the Employment of Salt in Agriculture* passed through thirteen editions in little more than the same number of years. In 1836 he was called to the bar, and in the following year published a treatise on the *Law of Bills of Exchange*, which was reprinted in 1839. In 1852 he edited the *Public Health Acts, 1848-51*, and illustrated it by many useful tables and notes. A volume from his pen descriptive of the *Objects and History of the Thames Improvement Company*, appeared in 1839, and a *Life of Sir Edward Coke* in 1837. In 1843 he printed the judgments of

the various courts of law on the notorious church-rate case at Braintree, and in the same year edited Mr. Veley's report of the case. He contributed many papers and prize-essays on special branches of rural industry to the *Quarterly Journal of Science* and the *Journal of the Agricultural Society*, and was a frequent contributor to the pages of the *Mark Lane Express*, *Farmer's Magazine*, *Journal of the Bath and West of England Society*, and kindred journals. His labours in promoting the improvement of the pursuit of English agriculture abundantly justified the honour of the Fellowship of the Royal Society, which was conferred upon him in March 1842.

MR. O. W. GOODWIN's death, which took place at Shanghai January 17, in the sixty-first year of his age, is a great loss to Egyptian study. Mr. Goodwin was elected to a Fellowship at St. Catherine's College, Cambridge, in 1838, and held it till 1847; on the establishment of the Supreme Court at Shanghai he was appointed Assistant-Judge, and in 1876 Acting Chief Judge. His acquirements were as varied as they were profound. He edited the *Anglo-Saxon Life of St. Guthlac*, the *Anglo-Saxon Legends of St. Andrew and St. Veronica*, a *Greek Fragment upon Magic*, the *Copyhold Enfranchisement Act*, the *Succession Duty Act*, and the *Probate Act*; though he is probably best known to the world in general by his essay on *The Mosaic Cosmogony* in the famous *Essays and Reviews*. It was as an Egyptian scholar, however, that he gained his chief laurels. Here his penetration, accuracy, caution, and solid knowledge placed him in the front rank of Egyptian decipherers. Among his numerous labours in this field of research may be mentioned his contributions to Lepsius' *Zeitschrift für ägyptische Sprache*, the *Records of the Past*, and the *Cambridge Essays* for 1864, in which he had an exhaustive article on "Hieratic Papyri." It should be added that he was also acquainted with both Chinese and Japanese.

PROFESSOR ERNST GROSSBACH of Bamberg, and later of Würzburg, died at Luzern on February 27, in his seventy-fifth year. Since 1834 he has held the chair of Philosophy and German Literature in the Lyceum, and his popularity as a lecturer for a long series of years attracted hearers from all parts of Switzerland. The clearness, simplicity, and finished beauty of form of his lectures on Aesthetic and Literary History led many to request their publication, believing that they would constitute an excellent handbook for the higher schools. But Dr. Grossbach would never give his consent. With the exception of a critical dissertation on the life and system of Spinoza, a summary *Geschichte des Naturrechts*, an oration on the hundredth anniversary of Schiller's birthday, his *Das Faust-Fragment*, and various articles in serials, the modest old scholar would never commit anything to the press. He had not an atom of pedantry. He was exceedingly loved in Luzern, and even during the past winter, in spite of his illness, gave several lectures to select private audiences, and took part in the meetings of the *Naturforschende Gesellschaft* and of the local branch of the *Fünfförte Geschichtsforschende Verein*.

NOTES OF TRAVEL.

News has been received from British Guiana that Mr. O. Ellis and Mr. Boddam-Whetham were to start last month on a journey into the interior as far as Boraima, and that Mr. E. F. im Thurn had already gone to the head-waters of the Essequibo on an ornithological expedition.

THE new number of the French Geographical Society's *Bulletin* contains a paper, translated by M. Ch. de Rouvre from the Portuguese, on the River Cunene, which flows through the province of Benguela in Western Africa, and which has not yet attracted much attention at the hands of explorers. The leaders of the Portuguese

African expedition, as we have mentioned before, at one time desired to include the exploration of this river in their scheme of operations, but received orders from Lisbon to abandon their intention.

AN International Geological Congress is to be held in Paris, and its sittings will probably commence on August 19.

A NEW monthly periodical, entitled *Annales de l'Extrême Orient*, and devoted to matters relating to Asia and Oceania, is to be started shortly at Paris, under the editorship of M. le Comte Meyners d'Estrey. The programme is a somewhat extensive one, for it includes geography, history, ethnography, philology, archaeology, science, literature, bibliography, fine arts, industry, commerce, &c. The chief object of the new magazine is professedly to make the public acquainted with the results of the explorations and scientific work in Asia and Oceania of Dutch travellers and others whose languages are but little known, and whose writings are consequently seldom consulted; it is also intended to obtain information direct from the Indian Archipelago, Australia, Japan, China, Indo-China, &c. In the opening numbers the editor proposes to furnish some articles on the recent explorations of the Dutch in New Guinea, Sumatra, &c.

ALL who are interested in the work of exploration will be glad to learn that the Royal Geographical Society have in the press a new edition of their valuable *Hints to Travellers*, which has been carefully revised by Mr. Francis Galton, F.R.S. This work, we believe, was originally drawn up in 1854, by a committee consisting of Captain (afterward Admiral) Fitzroy and Mr. Henry Raper, R.N.; and revised and enlarged editions were issued in 1865 and 1871, under the editorship of Admiral Sir G. Back, Admiral Colclinson, and Mr. Galton. The latter of these is now quite out of print, and the Council of the Society have resolved to take the opportunity of republishing the work in an altered and more handy form.

WE hear that Père Horner, of the French Mission at Zanzibar, contemplates undertaking a fresh journey of exploration in the interior of Africa in the course of a few months.

MAGAZINES AND REVIEWS.

THE March number of the *Cornhill* may almost be called a model number. The novels of which it contains chapters are both good, the only point which even a severe criticism would urge being that they are a shade too much alike in style, and that they so tend to confirm the impression of sameness which modern life makes upon those who have to live it. But the plots and atmospheres are by no means the same, nor is either unoriginal. The experienced novel-reader is already in a position to anticipate some interesting complications in the history of the Despard family in "Within the Precincts;" while he has had time, in the twenty-one chapters that have already appeared, to grow very fond of Sissy in "For Percival." Passing to the other pages of the magazine, we find the right proportions given to the right kind of subjects—history, travel, literature, and talk, and the treatment of all up to the old *Cornhill* level. The battle of Fornovo, told by "J. A. S.," Mr. W. G. Palgrave's eloquent description of "The Three Cities" (Hong Kong, Canton, and Macao), and the article on Aulus Gellius, by "J. C. C.," are the most striking papers in the number. The last especially is a study of literary society in the second century which makes the reader wish to know more, both of the second century, and of this semi-anonymous "J. C. C." It would not be expected of a *Cornhill* writer that he should touch on the many points in which Gellius interests the grammarian and the student of history and law; but as a sketch of Gellius in his lighter moments—his moments of gossip, of literary chat, of anecdote—

and as a sketch of the forgotten but interesting men who were his friends, nothing could be more lively. It does not seem, however, to have been very carefully revised. To say that Herodes Atticus reckoned among his ancestors "the hero of *Salamis*, the illustrious *Miltiades*," is startling; "the florid diction of contemporary diction" does not sound well; and one or two of the references are wrong.

Macmillan's Magazine contains the second of Lady Augusta Cadogan's pleasant articles on French society, called "La Grande Dame de l'Ancien Régime," which should be compared with the paper on "The Influence of Women" which forms the new instalment of the second series of "French Home Life" in *Blackwood*. Besides this, *Macmillan* has various papers on the topics of the day; one on Lord Shelburne, by a competent critic of our eighteenth-century history, Mr. E. J. Payne; and one on "German Views of Oxford and Cambridge," by Dr. Walter C. Perry. This last article, which is a recast and expansion of some remarks lately published by Dr. Perry in the *Deutsche Rundschau*, is of considerable interest as showing what ideas of the present state of the English universities prevail in even the highest scientific and academical circles in Germany. Dr. Perry is moved to write by some remarks lately made by Prof. Helmholtz in his opening address as Rector Magnificus at Berlin. The subject of the address was the "Academical Freedom of the German Universities;" and the desirability of such freedom was illustrated by references to its absence at Oxford and Cambridge under the sway of political and religious party. Prof. Helmholtz—who frankly owned when taken to task by Dr. Perry that he was writing from his recollections of a visit to Oxford in the pre-reforming era—makes many inaccurate statements, among others that "the college tutors may not deviate one hairsbreadth from the dogmatic teaching of the English Church without exposing themselves to the censure of their archbishops, and losing their pupils." Dr. Perry has little difficulty in showing that, although party still counts for a great deal and does much to prevent the wide working of the universities in the direction of culture, still 1854 and 1871 have not been without their effects. The moral of the whole story is that the feverish reforming activity which has consumed the universities during the last twenty-five years—"perpetual motion and no progress"—has not made much impression on the world, even the academical world, across the sea. It would perhaps have been well, however, if so important a personage as Prof. Helmholtz had taken a little more pains about all his details before publishing a criticism which is in the main sound and valuable.

THE *University Magazine* contains (amid much padding of a dismal quality) the second of Mr. Rossetti's two lectures on Shelley. This lecture professes to be a critical account of Shelley's chief poems. Mr. Rossetti takes Shelley's dominant idea to be human perfectibility, and traces its different developments through the poems with considerable ingenuity. A specially good account of *Alastor* is given. We know from Peacock precisely what Shelley meant by the title: *Ἀλάστωρ* is the evil spirit which haunts a man who chooses to live apart from his kind. Very few critics, however, have brought this out, and Mr. Rossetti deserves credit for doing so. Perhaps the *Revolt of Islam* is taken a trifle too seriously. The poem contains beauties in plenty, and there is certainly room for a detailed criticism of it; but the general crudeness and ineffectiveness of the narrative, despite such fine cantos as the fifth and twelfth, prevent it from being a "whole" in Goethe's sense of the word. Prometheus in *Prometheus Unbound* is taken to represent not simply man, but the human mind (*νοῦς*), while the grand idea in *The Cenci* is shown to be a sort of purified Stoicism. Specially interesting and original is the account of the *Triumph of Life*, as meaning the triumph of the sordid cares and common-

place temptations of life over the soul of man. Mr. Rossetti's criticism will give the reader a new insight and interest in that great fragment; but it must be confessed that, accepting such an explanation, the mention of Plato and Aristotle in the poem is not easy to explain. We wish that Mr. Rossetti had worked out his theory of the poem rather more fully. The summing-up at the end of the article hits the right point when it says of Shelley that he "imported into poetry to an unexampled extent modern ideas;" and, in estimating the nature of our debt to Shelley, some interesting remarks are made on the indivisibility of Shelley's work and character, as helping to explain the kind of affectionate enthusiasm now so often felt for him. Miss Helen Zimmern's article on "A Student of the Fifteenth Century" is an account of a certain John Butzbach, extracted from a MS. autobiography in the University of Bonn. It gives a not uninteresting account of the adventures of an unlucky German boy in the pursuit of knowledge. The famous Alexander Hegius, tutor of Erasmus, comes into the story, as young Butzbach went off to Deventer to become one of his pupils. Finally he attained the object of his ambition by being made a priest, and ended his life as prior of the monastery of Laach.

In the *Contemporary Review* Prof. Green continues his examination of Mr. Spencer's theory of an independent matter. Having shown in his previous paper that the object is not, as Mr. Spencer contends, marked off under the antithesis of vivid to faint states of consciousness, the writer proceeds to demonstrate that such vivid states do not at all enter into the objective world as such. Mr. Green's contention is that perception does not arise out of a mere sequence of single feelings, but is a consciousness of relations. It does not even include a sensation, though it includes a relation to a present sensation, and so is distinguished from a representation. Mr. Green takes what will probably seem to most readers unnecessary pains to show that perception does not necessarily rise and fall with the vividness of the sensuous impression. He fails, however, to tell us how we are to distinguish that "present feeling," a relation to which marks off perception from mere imagination. Passing to Mr. Spencer's other way of representing object as something beyond all states of consciousness, which representation is shown both to be inconsistent with the first mode and to fall in its turn into incompatible forms, Mr. Green reasons with cogency from the stand-point of Idealism against the admissibility of any such unknowable or manifested matter or force. Mr. Spencer's conception is said to be reached by a fictitious abstraction, since it is the negation of all states of consciousness, and so is supposed to be absolutely independent of consciousness. The essay, which is a long one, and by no means easy reading, illustrates that skill in unfolding new views in the process of destructive criticism with which the writer has already made us familiar. We think, however, that Mr. Green's extremely detailed mode of criticism is apt here, as in the case of Locke (whose language is no doubt far looser than that of Mr. Spencer), to lead to an exaggerated view of the amount of radical incoherence involved in the theory which he examines. It is hardly fair, perhaps, to tax a writer who analyses mind into the two co-ordinate categories of feelings and relations between feelings, and who ultimately identifies cognition with consciousness of relations, with recognising nothing but single states of consciousness. A thoughtful and impartial reader will probably be disposed to estimate the amount of fundamental opposition between Mr. Green's theory of perception and that of the "physical psychologists" to whom he opposes himself, as less than the writer thinks. Mr. Green himself says that it is very much a question of names whether we call consciousness of change or any other relation a feeling, and by so doing

appear to join hands with J. S. Mill, who clearly marks off the consciousness of the most fundamental relations, e.g. of a resemblance between sensations, from other feelings or states of consciousness (*Logic*, Book I., ch. iii., sect. 10 and 11).

REPORT OF THE SCOTCH UNIVERSITIES COMMISSION.

THE Royal Commission appointed in April, 1876, to enquire into the constitution, management, &c., of the Scotch universities has this week issued its Report. The recommendations presented for the consideration of the Crown, as comprised in a summary of considerable length, number sixty in all. A large proportion of them deal with the separate constitution of the four universities, so far as regards the Senatus Academicus and the corporate officials, and also with the proposed creation of a General Universities Court, with powers of appeal and supervision over the institutions already in existence. As is forcibly suggested by the entire tenor of the recommendations, the Scottish universities are more distinctly State bodies than the old universities of England. They are largely dependent upon Parliamentary grants for the means of their active existence, and consequently they are subjected to control and reform from without in a more comprehensive manner than we have any experience of on this side the Tweed.

The most interesting portion of the Report is that treating of the curriculum of the students and the organisation of the teaching-staff. On these points we fancy Oxford and Cambridge would feel peculiarly sensitive of any external interference; but in Scotland it is notorious that academical reformers have long been anxious to obtain authoritative sanction for changes which the universities are unable to effect of their own motion. On the one hand, it was not to be expected that the Professors should themselves initiate reforms, however desirable, by which their own emoluments would be directly diminished; and on the other, no real improvement can be achieved without an application to Parliament for the funds necessary to endow new Chairs, and furnish those now existing with adequate subordinates and apparatus. The Commissioners have set themselves to overcome the various difficulties that lay in their way with commendable thoroughness. In the first place they recommend the institution of a "first examination," which shall be incumbent upon all students who intend to enter the Arts course. The earlier Commission of 1859 deliberately avoided the adoption of this suggestion for reasons sufficiently well known; but the lapse of time has now convinced everybody that it is only by such a measure that secondary education in Scotland can be placed upon a proper basis, and the Professors themselves relieved from the necessity of teaching the elements to raw schoolboys. It is ingeniously suggested that the "first examination" might be combined with that for the election of bursaries or scholarships. The next proposal is that the Arts student, immediately after passing this examination, should be allowed to devote himself entirely to one of five lines of study—viz. (1) Literature and Philology; (2) Philosophy; (3) Law and History; (4) Mathematical Science; and (5) Natural Science. This suggestion seems to be partly copied from the Final Examination system at Oxford and Cambridge, and partly from the famous bifurcation scheme in the Report of the Devonshire Commission on Scientific Instruction. But it seems to us that the Commissioners have not sufficiently taken into account the early age at which students not uncommonly enter Scotch universities. If it be deliberately proposed that a youth who has passed an elementary examination in general subjects at the age of sixteen should be allowed to obtain a degree in Arts on the strength of his subsequent proficiency in Law or Chemistry, we can only reply that this result is very different from that realised at the

English universities, or contemplated by the Devonshire Commission. The next recommendation will meet with more general approval—"that there shall be only one class in honours, in which the successful candidates shall be arranged in alphabetical order."

With regard to the professorial staff—which, it must be recollected, is practically coextensive with the entire body of teachers—the Commissioners indulge in a large measure of augmentation. There are to be three new Professorships at Glasgow, four at Aberdeen, and one at Edinburgh, while one of the two Principals at St. Andrews is to undertake the duty of teaching either History or English Literature, as he may prefer. In addition, at all the universities provision is to be made for giving instruction in French and German, and several lectureships are to be founded in subordinate departments of study. We have not space to enumerate all the proposed new Chairs; but it may be observed that in the case of each of the four universities the crying wrong is to be redressed by which none of them at present has a Professor of History. We can find no reference to the Chairs of Theology, which it had been rumoured were to be thrown open to the three great Presbyterian bodies into which Scotland is divided.

The Commissioners then proceed to address themselves to the special wants of the Science Faculty, in this matter again treading in the steps of the Devonshire Commission. They propose that assistants or demonstrators should be allotted to the several Professors on a liberal scale, and that both a capital sum and an annual allowance should be supplied to them for the purchase of apparatus and materials. Altogether, it may be estimated that their recommendations involve an immediate capital outlay on this head of 1,500*l.*—apart from the erection of buildings, of which no estimate can be given—and the expenditure of as much again every year.

Herein, we are afraid, lies the weak point of the whole scheme. No source is suggested, or could be suggested, from which the money is to be derived except that common milch-cow, the Consolidated Fund. From the same source, we presume, are to come the funds from which the annual income of each Professor is to be guaranteed up to a minimum of 800*l.* We entertain no unkind feelings towards the Scottish universities, but we are bound to draw attention to this marked difference between the tendency of academical reform in England and in Scotland. Here we have universities rich with the accumulated wealth of centuries, which is admitted not to be at present devoted to its most profitable use. In Scotland the universities are stunted of their full development by want of money, and want of money alone. In conclusion, it is not unreasonable to ask the question why the Scottish student should have his education given him below cost price at the expense of the taxpayer of the United Kingdom, while the student at University College and King's College, London, or at the Owens College, Manchester, is left to pay for his own instruction as best he can.

JAS. S. COTTON.

GERMAN LETTER.

Gotha: February 28, 1878.

Schliemann's book about Mycenæ has met with due recognition in Germany. The importance of the discoveries enables us to swallow all the pompous talk about Agamemnon and Clytemnestra, and Mr. Gladstone's extraordinary Preface. The more accurate accounts of the somewhat similar discoveries of Spata have probably by this time dispelled the doubts which Mr. Murray expressed in these columns as to the antiquity of the gold articles. Those doubts were by no means unfounded, nor can we help regretting that one of our most distinguished scholars, to whom we are always ready to lend an attentive ear, should have engaged in such a useless discussion. The importance of the discoveries at Mycenæ

consists in the fact of articles bearing a hitherto unknown stamp having been found side by side with articles already familiar to us. There is much that puzzles us still, and for the present we must be content with knowing that we have stumbled upon a stratum of the civilisation of a Greek people identical with the earlier population of Asia Minor, whose industrial art was dependent on the Assyrian-Babylonian. Herr Köhler's lecture in Athens was probably based on this view; but it surely cannot be right to apply the name of Carians to this people.

Immensely superior to the numerous works of the present day on the history of art is the last work of Anton Springer. The eminent historian has of late distinguished himself in the political field by the penetration and fervid eloquence he has displayed in defending the interests of Germany and public right against the Russophiles. He has now by his double biography, *Raffael und Michelangelo*, made an important contribution to the collection entitled "Kunst und Künstler des Mittelalters und der Neuzeit" (Leipzig: E. A. Seemann), edited by R. Dohme. The first book, *Bis zum Tode Julius II.*, is completed. I cannot here enter on its importance in the field of scientific research, especially as the explanatory notes are not to be published until the close; the chief merit of the work is already apparent, and that is the clear and vivid manner in which these two great artists and their creations are represented to us. The author displays a thorough knowledge of the times and people, joined to a nice understanding of the individual minds of his heroes; and the vigorous and beautiful language harmonises with the wealth and clearness of the thoughts. A number of careful illustrations give additional value to the book; the series of drawings, for instance, in the beautiful chapter on Raphael's Madonnas will greatly interest most readers: while the penetration of the historian is apparent in the description of the *stanze* as in the review of the Roman works. Julius II. stands prominently forward as "wahrer Papst der Renaissance," and the title of honour usurped by Leo X. is restored to him. The only thing that strikes one as strange is the stress laid on the relation of Michelangelo's early works to the antique, whereas precisely in these, as in the *Bacchus and Ampelos*, in spite of the antique form, one is disagreeably impressed by a leaning to the ugly which is characteristic of Michelangelo's harsh nature.

A selection of poems from the posthumous works of David Friedrich Strauss has been published under the title of *Poetisches Gedenkbuch* (Bonn: E. Strauss), with a preface by the editor, Ed. Zeller, the author's friend and countryman. The intention of the book is expressed in the opening lines:—

"Diese schlichten kleinen Lieder,
Stille Seufzer meines Herzens,
Sind für meine lieben Freunde,
Sind für wenige Vertraute,
Für die Menge sind sie nicht."

Those who have an ear for delicate rhythm will be struck by the melodious ring of these simple verses, and this it is which, apart from the personal interest, lends them such a charm. We must not, of course, expect in the stray leaves of a scholar's diary to find the poet's inmost soul revealed to us, but the beautiful form and the clear and serious thoughts justify our designating many of these poems as classical.

A curious contrast to the above are Emanuel Geibel's *Spätherbstblätter* (Stuttgart: Cotta). The born wandering-musician is he, from whose bow the tunes flow in one unbroken stream, not always new and original, sometimes even very insignificant, but invariably melodious and pleasant to the ear. Upon no single occasion, either in love or hate, has Geibel overstepped the bounds prescribed by tradition to the feelings of a sensible and well-bred man; but his sentiment is deep and

tender, and he has true culture; both nature and history have furnished him with pictures and thoughts brilliant and vigorous in their colouring. The picturesque old town of Lübeck, the poet's home, with her towers and gateways, her blue waters and her lovely beechwoods, and the shores and islands of Greece with their vines and cypresses, were the source whence he drew all his most charming inspirations. To them we likewise owe the most original pieces in the collection—the charming idyll "Oharmion," and the beautiful songs at the close. The weakest part of the book are the "Sprüche;" particularly fine, on the other hand, are the "Distichen aus dem Wintertagebuche." The form is throughout melodious and correct, and on that account Geibel, though wanting in any remarkable poetical power, is especially to be recommended to foreigners as a worthy representative of modern German culture.

The most popular work among the latest additions to our polite literature, and a favourite gift-book this year, is Georg Ebers' *Homo Sum* (Stuttgart and Leipzig: Hallberger). The first two novels by the learned Egyptologist suffered from a contradiction between the ancient dress and the modern sentiment. In the new work the heroes are Christians of the fourth century—hermits, it is true, and people whose ideas of Christianity assume a somewhat eccentric and exaggerated form; but these ideas have been familiar to us from our youth up; the dress also of the later Roman civilisation is known to us, and not so essentially different from our own as to appear strange. In consequence the poetical powers of the author for the first time have full play. The strange character of Mount Sinai, as also the individual figures of the Christian-pagan world, are clearly and vividly portrayed; the author is particularly successful in the painting of graceful *genre*-pictures, such as the opening scene, the herdsman at the well playing with the goat, or the discus-match between the old recluse and the youth. The merits and defects of the book cannot be better described than by comparing its various scenes with the rather too highly-finished though careful paintings of Adriaen van der Werff.

Another pretty novel is *Stufenjahre eines Glücklichen*, by Louise von François. The general plan is not entirely satisfactory, and here and there we come upon faults of drawing which, without being ungallant, we may attribute to the unsteadiness of a female hand; but at the same time we are struck by an essentially feminine delicacy of observation and talent for description. The sentiment and tone are vigorous and healthy, and a vein of geniality runs through the whole.

Emil Kuh's *Biographie Friedrich Hebbels*, (Wien: Braumüller) is a curious book. Hebbel was an extremely gifted but an unharmonious poet, and as clever as he was disagreeable. He was swayed by the most barbarous egotism, and yet exercised such power over others that they submitted and sacrificed themselves to him without resistance. The writer of this biography, who unfortunately died before its completion, is himself a remarkable instance of the reverence and devotion paid to Hebbel. The work is carefully executed, and as a psychological study extremely interesting. It gives us the history of the poet's childhood as written by himself, together with minute descriptions of persons and things in Copenhagen, Vienna, Hamburg, and other cities; that of Young Germany being the only one that strikes us as rather inadequate.

Having extolled the merits of the first two volumes of Th. v. Bernhardt's *Geschichte Russlands* (Leipzig: Hirzel), I must not forget to mention the appearance of a third, which treats of the years 1815 to 1819. At length the real subject of the work is taken in hand, but on such an extensive scale and with such copious digressions relative to the affairs of France and Spain that one hardly has courage to go on with the book, and despairs of ever seeing it finished. Belonging to the same collection, "Staaten-

geschichte der neusten Zeit," which already comprises so many interesting works—such as Reuchlin's *History of Italy*, Springer's *History of Austria*, Pauli's *History of England*—a new work is forthcoming to which we look forward with great curiosity—H. von Treitschke's *Deutsche Geschichte* at the time of the German federation—on account of the singular ground the author takes, both as a politician and an historian. An essayist of the most irresistible eloquence, he nevertheless owes his political influence to the good faith with which on all sides a scientific man and a pupil of Dahlmann's is met; on the other hand, the scientific weakness of his line of argument has until now been attributed to the zeal of the partisan. We are, therefore, curious now to see what sort of an historian the pamphleteer will prove. C. ALDENHOVEN.

CORRESPONDENCE.

DUNCKER'S "HISTORY OF ANTIQUITY."

Balliol College: March 9, 1878.

I have no wish to find fault with anyone who points out mistakes, or what he thinks to be mistakes, in any work of mine. But I should like to say that the "downright mistake" of writing *Kaldini* for *Kaldai* is an exact copy of the German original, which was not corrected by Prof. Duncker when he read over the proofs. In spelling *Khufu*, &c., with *Ch*, I followed the ordinary transliteration of Greek words. It must be borne in mind that Duncker draws from Greek as well as Egyptian sources, and it would have been awkward to use two letters, *Ch*, *Kh*, according as the word, or form of the word, was Greek or Egyptian. Even as it is, the variety of the names is sufficiently confusing. Grote writes *Chalkis*, and not *Khalkis*, and I think that I have observed that Prof. Sayce writes *Karchemish*, which, I suppose, represents *Karkhemish*. In spelling *Schasu* with *Sch*, I was aware of my error, but having once printed the word, so spelt, by an oversight, I thought it better to go on doing so, on the principle that error is better than confu-

sion. The same spelling will be found in *Abacha* on p. 120, and in some names on p. 163. I may add that Prof. Duncker not only revised and enlarged the MS. translation of the Second Book of the History, but also read and corrected the printed sheets with very great care. He has kindly consented to read the proofs of the second volume, which, though delayed by the appearance of a new edition of the original, will, I hope, be ready by the end of the year.

EVELYN ABBOTT.

Queen's College, Oxford: March 11, 1878.

Mr. Evelyn Abbott has overlooked the fact that I did not make him the original author of the mis-spelling *Kaldini*, but quoted it as an example of the errors that might have been avoided in the translation, like the faulty transliteration of proper names, had the aid of an Oriental scholar been called in. It is of little consequence whether the author and translator were conjointly responsible for such mistakes, or the translator only. Nor is it by any means the only mistake of the kind. Thus we have *Ubaratulu* for *Ubaratutu* (p. 239), *Milihiru* for Smith's *Milisihi*, which should be *Meli-Sipak* (p. 262), *Beth-Sida* for *Beth-Zida* (pp. 291, 295, where, by the way, *Saggadhu* is rendered "Prosperity" instead of "High head"), *Kummukh* for *Kummukh* (p. 519), *Musasir* for *Musasir* (p. 520).

I was not aware that *Khufu* is a Greek word; the case would have been different had the form *Oheops* been used, though Mr. Abbott is not consistent even in his transliteration of the Greek χ , as *Edorakhus* with *kh* (p. 239) shows. To make the confusion worse, however, Mr. Abbott sometimes writes single *h* instead of *ch*; thus *Istar-nanchundi* appears on the same page (253) as *Halludus*, *Kudurnanchundi* on the same page (251) as *Bil-hiliana*, while we find *Chullu* on page 520, and *Hammurabi* (*Khammuragus*) on page 261 and elsewhere. But Mr. Abbott is equally inconsistent in his transliteration of the Greek κ . Thus we have *Eudokus* (p. 239), *Kobos* (p. 561), *Rhyndakus* (p. 529), *Kalykadnus* (p. 534), but *Cotys* (p. 561), *Celenderis* (p. 538), *Celaenae* (p. 526).

In *Carchemish*, the medial guttural represents η (c) not π (*kh*), as in *Meshech* (which is written *Mesech* on p. 512).

Two wrongs hardly make a right, and I do not see that the spelling *Abacha*, &c., is justified by the mis-spelling *Schasu*. Besides, what is to be said of the curious form "Rumanisch" (p. 524)?

A. H. SAYCE.

GRATZ.

School Hall, Bury St. Edmund's: March 7, 1878.

Allow me to correct Dr. Murray's derivation of the word "Gratz," in your last number (p. 189), by mere change from "grad" or "gorod." It is from "gradetz," the diminutive of "grad," and is as distinct from it as our "fortress" is from "fort." "Gratz" is, indeed, only a German corruption of "gradetz."

A. H. WRATISLAW.

JOSEPH BONOMI'S WORK.

St. Stephen's Club: March 9, 1878.

THE ACADEMY is so invaluable as a students' record that I take leave to supply a reference which has been singularly omitted in all the notices of our late venerable and distinguished friend, Mr. Bonomi. In none of these is there any mention of his most laborious work, that of which he was most proud—the transcription of the Ritual inscribed in the Belzoni Sarcophagus (at the Soane Museum) published, with a description by Mr. Samuel Sharpe, in 1864. The hieroglyphic script was drawn on stone by Mr. Bonomi's own hand; and the whole (about forty pages quarto) is so perfect in delicacy of drawing and refinement of expression of the original that it is

matter of regret that his master-hand was not employed to design the moveable open-hieroglyphic type which has since come into use. If I remember rightly, he did design the closed (black) type which was used by Longmans, before the Berlin open type obtained the preference of Egyptologists. W. J. COCKBURN-MUIR.

GRIMM'S LAW.

52 Thornhill Road, N.: March 9, 1878.

As the writer of the article in the *Westminster Review* referred to with approval by Dr. Murray, I need hardly say that I agree with much of his letters on this subject. But it is only fair to point out that the modernness of the High German changes was (as stated by Prof. Max Müller in his *Lectures on the Science of Language*) strongly maintained by Grimm himself, who ascribed them to the seventh century of our era; in the first part of the *Deutsche Grammatik*, published in 1822 (half a century before my article), Dr. Murray will find some of the reasons adduced in his letters, as well as others equally cogent, applied to prove, not only the lateness of the High German sounds as compared with the Low German, but the lateness of the Low German sounds as compared with the Sanskrit. Both these facts were, and are, fully recognised by almost all German philologists; so that, however unsound their theories to account for the changes, and however misled by mistaking symbols for sounds, Grimm and most of his compatriots do not deserve Dr. Murray's reproaches on the chronological point. That the General Teutonic consonants present, on the whole, greater differences from those of the other Aryan languages than these do among themselves, and that a similar proposition is true of the High German consonants when compared with those of the other Teutonic languages, are facts which it is Grimm's (and Rask's) merit, not defect, to have observed and insisted on.

The only point on which I entirely disagree with Dr. Murray is his theory that the High German consonant-changes are the result of the adoption of Low German by a Slavonic race. Dr. Murray asserts that his solution cannot be disproved; here I join issue, and undertake to show not merely that his theory is superfluous, but that it is in contradiction with some of the facts (which he has not stated with entire fulness and accuracy), and fails to account for others. But to do this would require more space than the ACADEMY can well spare; I will, therefore, here confine myself to pointing out a fact overlooked by Dr. Murray, who has consequently presented part of the subject in a light made false by contrast. This is, that almost all his remarks on the High German consonant-changes from original Teutonic apply with equal force, though with differences of detail, to the General Teutonic consonant-changes from original Aryan.

1. "The changes between General Teutonic and Old High German are not the same as those between Sanskrit and Teutonic." But some of them are the same, O. H. G., and Gothic, *t*, for instance, corresponding respectively to Gothic, and to Sanskrit, *d*; the theory of mispronunciation by speakers of another race is as much, and as little, called for in the one case as in the other.

2. "The O. H. G. changes, compared with the General Teutonic, are later, derived, and dialectal." But the General Teutonic changes, compared with the Sanskrit and original Aryan, are also later, derived, and dialectal; it is quite possible that the Gen. Teut. changes took place in a population no larger than that in which the O. H. G. ones did, and General Teutonic is as certainly a mere "dialect" of Aryan as High German is of General Teutonic.

3. "Grimm's Law, as concerns the relations between Gen. Teut. and its O. H. G. dialect, is a misapplication altogether." This is only partially true, and is true to nearly the same extent of the

relations between General Aryan and its Teutonic dialect; High German has as much right to form a third limb of the law as General Teutonic to form a second, the difference being one of degree only, not of kind.

4. The O. H. G. changes are "perversions" and "mispronunciations." But the Gen. Teut. changes are equally perversions and mispronunciations; the Gothic *fadar* and *brōpar* are at least as much "perverted" from the original Aryan *patar* and *brātār* as the O. H. G. *vatar* and *bruoðar* from the original Teutonic *fadar* and *brōpar*. I object, however, to the terms themselves; to call phenomena bad names hardly tends to promote a scientific spirit in investigating them.

As for Mr. Douse's arguments, they involve to such a large extent assumptions and a method which I believe to be entirely false, that I will not here attempt a refutation which would require many philological principles, and some of those of scientific investigation generally, to be discussed from the foundation. But I would remark that it is much to be desired that those who study pre-historic phonology would prepare themselves by a proper study of historic phonology; the investigation of the unknown can be scientifically conducted only on the principles obtained from that of the known. These principles, and the data of the case, combine to show that the General Teutonic Lautverschiebung is really a series of changes separated by considerable intervals of time, some of which have occurred in other Aryan languages; and that the High German Lautverschiebung only adds a few more, also of different dates, some of which have likewise occurred (subsequently to the General changes) in other Teutonic languages. To cease considering each so-called Lautverschiebung as an indivisible simultaneous group of changes is an essential preliminary to their rational explanation; and I can only regret that Dr. Murray, like many other English philologists, is not acquainted with the important discoveries in pre-historic Teutonic phonology (by which I mean the historical relations of the sounds of the oldest Teutonic languages among themselves, and to those of original Aryan) made in Germany and elsewhere in recent years. In conclusion, that my criticisms may not weaken the effect of Dr. Murray's many excellent remarks, I would strongly call the attention of all investigators of the subject to the first two paragraphs of his first letter, and the one numbered 2 in his second, whose arguments have not been disposed of by Mr. Douse.

HENRY NICOL.

RECENT ORIGIN OF HIGH GERMAN.

Ecclcs: March 2, 1878.

There is a portion of the subject treated by Dr. Murray in his letters to the ACADEMY, which is of singular importance, not only to philologists, but also, and even in a greater degree, to students of ethnology; and, as one of this latter class, I should like to be permitted to add some facts to those he has quoted.

For some years it has been a growing conviction among some ethnologists that the peculiarities which differentiate High German from Low German must be of comparatively recent origin, and nothing perhaps but the great authority of a name like Grimm's has prevented an open revolt against his conclusions on this subject. A Hessian himself, it is a strange fact in this controversy that his own people, who are now a High-German-speaking race, should in early times, as he himself in fact allowed, have been called Catti, the Low German form of the name Hessian: evidence *pro tanto* that they then spoke Platt Deutsch—evidence which is confirmed by the fact which Tacitus tells us, that the Batavi, the ancestors of the modern Dutch, were a colony of the Catti. The language of the Franks, as tested by such factors as the Malbergian glosses, was Low German. Yet the Franconians of to-day, who are descended from the same stock as the Salians and Ripu-

arians of early times, speak a High German dialect; while the Flemings, who are probably very pure Franks, still speak Low German. The Suabians are typical High Germans; yet they belonged in early times to the same great Suevic stock to which the Angles, Lombards, and Saxons belonged. The Lombards themselves, if we examine the names of their chiefs, were apparently typical Low Germans when they first settled in Lombardy, and speedily became High Germans after settling there. On this subject I would commend to Dr. Murray's notice, as containing some facts most valuable for his purpose, the second of two recent tracts on the Lombards by Dr. Friedrich Bluhme, entitled, "*Die gens Langobardorum. Zweites Heft: Ihre Sprache.*" All these facts, and more that might be quoted, point to one result only, that so clearly expounded by Dr. Murray—namely, that High German is a comparatively recent form of the Teutonic speech, a form which has encroached most rapidly upon the older form of the language since the sixteenth century. An admirable work on the gradual displacement of Platt Deutsch from early times is before me, by Kinderling, on the history of the Nether-Saxon or Platt Deutsch, until the time of Luther (Magdeburg, 1800). I doubt whether the change is to be dated quite so late as Dr. Murray puts it—namely, the eighth century, and my own view is that it largely occurred in the sixth and following century.

Now, as to the cause of this change. Here I can only go a certain distance with Dr. Murray. It is of course a familiar fact that ethnologically the South Germans are not pure Germans at all: their physique, complexion, and other idiosyncrasies point them out as decidedly a mixed race, a race compounded of German invaders with indigenes of some kind or other. This is put beyond doubt when we examine those great storehouses of ethnological data as yet so little explored—namely, the codes of the early German races. If we examine the Suabian, Burgundian, and Alemannic codes, as has been well pointed out, we shall find the servile class, and the class of *liti*, or *coloni*, treated very differently and with much more tenderness and forbearance than among the Frisians, Saxons, Franks, &c. This points to the indigenes having been a much more powerful and important element in the population in the South German area than in North Germany, and would even point to their having been the majority of the population, overlaid and ruled by a mere German caste. This I believe to have been certainly the case. Who, then, were these indigenes? Dr. Murray suggests they were Slaves. I confess to feeling it impossible to accept this view. We have no evidence whatever that Slaves existed in South Germany until much later times, and it certainly would require a very new reading of our authorities to suppose that in Roman days this area was occupied by Slaves; nor do we find High German peculiarities in the German area beyond the Elbe, where the Slaves were predominant until comparatively recent times. The greater part of South Germany—that part occupied now by the most typical High Germans, the Suabians, and the German-speaking Swiss—was a well-settled Roman province. Vindelicia, Rhaetia, &c., were as much Romanised as Pannonia or Gaul, and are strewn with the proofs of Roman occupation as far north as the Rhaeticus limes, which separated it from Germany proper. It was doubtless occupied by the Romans as early as the days of Domitian, and remained theirs more or less until Alaric and his Goths took possession of it. I have no doubt myself that a form of rustic Latin was spoken all over the district, and the Romanch dialect of the Alps is doubtless a relic of this old tongue. My view, then, which only differs in a minor detail from that of Dr. Murray, is that the peculiarities of High German are due to its being the adopted language of a Romanch-speaking people, and that before the fourth or fifth century it did not exist at all; that far from holding the position of a sister-

to Platt Deutsch in the hierarchy of languages, it is but a bastard daughter, corrupted in form and pronunciation by its having been adopted by an originally non-German-speaking race.

HENRY H. HOWORTH.

THE "POLITICS."

1 Marlow Road, Kensington: March 11, 1878.

May I point out one or two inaccuracies in Mr. O. Browning's review of the three books of Aristotle's *Politics*, translated by Mr. Bolland, with essays by myself? The title of the volume is not "*Aristotle's Politics*." By W. E. Bolland and A. Lang." I do not know how much that title may promise, but it is entirely an effort of Mr. Browning's memory or fancy. Mr. Bolland did not translate "the first four books," but Books I., III., IV. (or VII.). Book VIII. (or V.) was not included—which Mr. Browning regrets—because it is not one of the three which passmen take up at Oxford. This is explained in Mr. Bolland's Preface. May I add "for information," as none of my critics have spared me the trouble, that the essays are intended, among other illustrations of the connexion of Greek and "primitive" culture, to elucidate the modern theory of the growth of the family within the already existing *γένος*, in opposition to the theory which makes the *γένος* grow out of the family? A. LANG.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, March 18.—5 P.M. London Institution: "The Youth of a Planet," by E. A. Proctor.
8 P.M. Society of Arts (Cantor Lecture): "Application of Photography to the Production of Printing Surfaces and Pictures in Pigments," by T. Bolas.
8 P.M. British Architects.
8 P.M. Victoria Institute: "Was the name *Jehovah* known to all Semitic Nations?" by Prof. Swainson.
TUESDAY, March 19.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.
7.45 P.M. Statistical: "Famines of the World," by C. Walford.
8 P.M. Society of Arts: "Egypt: its commercial Changes and Aspects," by B. T. Cobb.
8 P.M. Colonial Institute: "New Zealand and the South Sea Islands," by Sir Julius Vogel.
8 P.M. Civil Engineers: Discussion on "Railway Appliances at the Philadelphia Exhibition."
8.30 P.M. Zoological: "Contributions to the Ornithology of the Philippines, VI.," by the Marquis of Tweeddale; "Reports on the Collection of Birds made during the Voyage of H.M.S. *Challenger*, VIII.," by P. L. Sclater.
WEDNESDAY, March 20.—7 P.M. Meteorological: Discussion on "Winter Climate of some English Sea-side Health Resorts;" "Notes on a Waterspout," by Capt. W. Watson; "Globular Lightning and Waterspouts in Co. Donegal, Ireland," by M. Fitzgerald; "Observations of Rainfall at Sea," by W. T. Black.
8 P.M. Society of Arts.
8 P.M. Geological.
8 P.M. British Archaeological: "Early Earthworks on West Stow Heath," by H. Prigg; "On the newly-discovered Cavern at Eltham," by E. P. Loftus Brock.
THURSDAY, March 21.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.
7 P.M. London Institution: "On Marco Polo," by Col. H. Yule.
7 P.M. Numismatic.
8 P.M. Linnean: "Venation of *Conium maculatum*," by J. Gorham; "New Arrangement of the Classes of Zoology," by B. Clarke; "Fungi of Queensland," by the Rev. M. J. Berkeley and C. E. Broome.
8 P.M. Chemical: "On Nitrosamines," by Dr. Witt.
8.30 P.M. Royal. Antiquaries.
FRIDAY, March 22.—8 P.M. Quekett.
8 P.M. Society of Arts; "Depreciation of Silver," by Col. J. T. Smith.
9 P.M. Royal Institution: "Recent Experiments on Fog Signals," by Prof. Tyndall.
SATURDAY, March 23.—3 P.M. Royal Institution: "Natural History of the Ancients," by the Rev. W. Houghton.
3.45 P.M. Royal Botanic.

SCIENCE.

The Physical Basis of Mind; being the Second Series of Problems of Life and Mind. By George Henry Lewes. (London: Trübner & Co., 1877.)

(First Notice.)

IN the present volume there are four essays, and the first deals with the "Nature of Life." There are, Mr. Lewes tells us, three chief modes in which the one existence or matter of things is manifested, Force,

Life, and Mind; the last two being special complications of the first. The speciality of the movements and decomposition with which the biologist deals lies in their production by matter in the state of organisation. The sum of the properties of matter in this state is called Vitality, while Life is the series of reactions resulting when the molecular equilibrium of an organism (*i.e.*, any organised substance capable of manifesting this series) is disturbed by the matter outside it. This relation of Organism and Medium is thus the most fundamental of biological data. Besides the External Medium, within the organism itself the nutritive fluids and their temperature and electrical condition constitute what Claude Bernard calls the Internal or Physiological Medium. The organism is neither passive nor spontaneous, but is ever adapting itself to fluctuations in the external medium, and generally by readjustments of its internal medium. "Organised activity is a simultaneity of opposite tendencies, as organised matter is a synthesis of compositions and decompositions, always tending towards equilibrium and disturbance, storing up energy and liberating it." But Mr. Lewes gives another account of the organism, which, like one of two versions in an old chronicle, is interwoven more or less picturesquely with the first, so that the interested reader the less suspects the awkward gaps that may lie between the two. All organisms above the very simplest are a synthesis of three terms, Structure, Aliment, and Instrument. By Structure, we are casually told, is meant Protoplasm, which receives this at first sight inappropriate name to keep prominent the fact of its complicated molecular structure, notwithstanding the absence of definite configuration. Aliment or Plasmode is the nutritive material of the internal medium; and Instrument, when present, is material formed or evolved from the plasmode by the protoplasm, and engaged, directly or indirectly, in the preparation or distribution of aliment. (It is hardly needful to remark the substantial resemblance between Mr. Lewes's three terms and the Bioplasm, Pabulum, and Formed Material of Dr. Beale.) Many of the properties and functions of the instrumental part of the organism are explicable by mechanical or chemical laws; but the power of forming new organised matter, which belongs exclusively to protoplasm, is a fundamental property so far unique and unexplained. Further "a microscopic lump of protoplasm" is itself "the simplest form of life." If, then, we proposed to distinguish, as Mr. Lewis does, as Aristotle did, between Life or "the special manifestations" of an organism and the causes of these manifestations; and if we maintained that one particular kind of substance, protoplasm, was the *sine qua non* of all life, and sufficient—in a proper medium, of course—to life in its simplest form; might we not fairly consider the properties of this protoplasm as *the* cause of life, and call it vital or living matter in a sense that would not apply either to the alimental or instrumental portions of an organism? Yet Mr. Lewes is very severe with Dr. Beale for doing this, although he applauds "the striking definiteness of his conception." Dr.

Beale says that everything in the organism except its protoplasm is *dead*: Mr. Lewes, that "epidermis, nail, horn, hair, and bone, so long as these form constituents of the living organism, are *living*." Plainly, then, two very different things are meant, and the only real question is whether each deserves a name and how far the name given is appropriate. Suppose we only knew collective humanity, but not its constitutive unit, and that then somebody discovered that talkative, tool-making animal swayed by egoistic and altruistic impulses that we call man, in what a new light would social phenomena appear! And what should we think of the expositor of scientific method who told the discoverer that he had been misled by the "analytical artifice" in calling the single man human; because an isolated man is not equal to the manifestations resulting from a collection of men with their productions and their influence on each other? Nay, what should we think of him if he had said:—You might as well have called cooking-utensils human, since they are a never-failing accompaniment of social phenomena? Yet this is pretty much Mr. Lewes's *reductio ad absurdum*, when he tells Dr. Beale he might as well "endow the phosphates with Vitality on the ground of their indispensable presence in all vital phenomena." But when did Mr. Lewes find phosphates "manifesting the cardinal phenomena of Life, Assimilation, Evolution, Reproduction, Mobility, and Decay," as he allows a microscopic lump of protoplasm does? There are then (1) Protoplasm, having of course a molecular structure, but not what is ordinarily called organisation and manifesting Life writ small; (2) Organisations of protoplasm, including "plasmode" and formed material, and manifesting a somatic Life, so to put it, depending on the co-ordination of lives such as that in (1). Both these furnish the biologist with distinct problems, while their relation to each other is a further problem still. Anyone, therefore, who helps us to a new conception bringing out with "striking definiteness" this peculiarity of (1) and at the same time embodying real fact and enabling us to see the one in the many deserves our thanks rather than a lecture on the relations of analysis and synthesis.

Mr. Lewes calls his own view of Life Organicism, contrasting it on the one hand with Vitalism, or the theory of a distinct vital force, and on the other with Materialism, which "refers Life to some inorganic agent, physical or chemical:" the former he condemns as gratuitous, the latter as inadequate, because overlooking the special complications of organised beings. But if the properties of protoplasm result entirely from its molecular constitution, with what show of reason can Organicism be called radically different from Materialism? Either diagrams representing the configuration and energy of the organism at any given moment and the variation produced in these by any given change in the medium are conceivable or they are not: if they are, biology is surely no more *radically* distinct from physics than astronomy is; if they are not, then there is room for the extra-physical "vital force" which Mr. Lewes rejects.

In the last chapter of this essay the author proposes some improvements in the Darwinian hypothesis. Besides the external struggle between different organisms, there is, he maintains, an analogous internal struggle between the several tissues and organs of the individual organism. This internal struggle is due primarily to the inherent indefiniteness in the chemical composition of organic substances and the consequent variability in "what, for want of a better term, may be called the *organic affinities*." "As the presence of fused iron in the crucible partially abstracts the combination of sulphur and lead, so the presence of connective tissue partially obstructs the combination of muscle-protoplasm with its pabulum;" and a slight change in the internal medium may alter the balance between the two—*i.e.* may be favourable to one organic affinity and unfavourable to the other, and thus entail a corresponding alteration of structure and so of function. But there soon comes a limit to the ascendancy of any single tissue or member: as in the external struggle, so here—the mutual antagonism of rivals is an effectual bar to the potential indefiniteness of multiplication that belongs to each by itself. Of the three factors supposed to be concerned in evolution, (1) variations consequent on the internal struggle, (2) variations in consequence of the external struggle, and (3) the process of selection, Mr. Lewes regards (1) as the primary and most important, and (3) as but a metaphor, a short-hand expression of the results. But this is surely too strong. In (3) the working of limited food-supply, &c., finds expression; (1) and (2) could exist without this, but there would be no selection. It is this Ricardian Law of Rent in a new guise that makes landlords of a selected few. The conception of Organic Affinity also in his opinion curtails the range of Darwin's Theory of Descent:—

"All the complex organisms are evolved from organisms less complex, as these were evolved from simpler forms; the link which unites all organisms is not always the common bond of heritage, but the uniformity of organised substance acting under similar conditions" (p. 113).

In support of this position he urges that it would explain such facts as the existence of phosphorescent organs in very widely different orders and their absence in nearly-related forms, or the possession of electric organs by seven species of fish belonging to five widely-separated genera. But Mr. Lewes overlooks what has been done in this direction by Mr. Spencer, Prof. R. Lankester, and others.

The second and longest essay is devoted to the "Nervous Mechanism." It mainly consists of a polemic against what Mr. Lewes calls "the false persuasion of knowledge" on this subject, or, as he also styles it, the "superstition of the nerve-cell." But the attack is out of date, and therefore unfair and misleading. It would be hard to find a first-rate text-book that is behind Mr. Lewes in recognising the central irradiation of excitations, the possession by fibres apart from cells of the property of "neurility," and the impossibility of ascribing the nervous energy of an organism to its nerve-cells.

alone, or even to its nerve-tissues alone. The attack is also indiscriminating. Instead of contenting himself with exploding the now almost forgotten notion that nerve-centres, like the batteries in a telegraph, are the sole sources of energy, and the fibres only conducting wires, Mr. Lewes attempts to degrade the centres to mere junctions where stimulations are reflected. So that, for example, if the skin-nerves happened "to pass directly to the muscles underneath, they would move those muscles without the intervention of a centre;" the muscles only needing to be so anastomosed that "their separate energies should be combined and co-ordinated." And, as if to give point to all this, a whole chapter is devoted to an account of experiments by Engelmann, Foster, and others, showing the very probable existence of non-nervous tissues that are automatic. But what has that to do with the automatism of nerve-centres? That a snail's heart pulsates without ganglia does not prove that in the case of structures connected with ganglia the ganglia are not alone automatic. On Mr. Lewes's theory it would be impossible to account for the difference between the tetanic contraction that follows normal central stimulations and the solitary twitch that is all a direct shock to the motor nerve produces. The movements of the iris in the excised eye, as observed by Brown-Séquard, appear, however, to make for him, and he describes them accordingly; for here is a nerve-muscle tissue still moving when taken right out of the body. But the Swedish physiologist, Holmgren, who has given much attention to this phenomenon, has shown the supposed automatism of the iris to depend upon the retina, which, as is well known, contains a layer of ganglion-cells. *Apropos* of this the following remark, which Mr. Lewes makes elsewhere, comes in oddly:—

"Look at the cells of the retina—no one will assign motor functions to them—yet they are the same as those of the cerebellum and the anterior horns of the spinal cord" (p. 272).

Holmgren, we see, does assign motor functions to them, and in doing so disposes of so much of Mr. Lewes's arguments against the automatism of nerve-cells. He has, however, still a weighty argument in an experiment of his own, which, if true, might overturn everything. He says:—"In frogs with very irritable tissues I have found not only the pupil contracting, after the whole cranial cavity has been emptied, but even the eyelid close on irritating the conjunctiva." In a note it is added, "The experiment often fails." That is not surprising; indeed, this so-called experiment is commonly used to test whether the brain has been thoroughly destroyed or not.

Throughout this essay there is abundant reference to the latest work in nervous anatomy and physiology; but somehow Mr. Lewes's scientific erudition is rather one-sided. Thus, there is not a word about such work as Meynert's, Gudden's, or Flechsig's in anatomy; nothing of the able investigation of Ludwig's scholars, Woroschiloff, Owsjanikow, and others; though from these his readers would have learnt something of the amazing complexity of the "nervous mechanism." But the drift of his exposition

is to reduce it to a sort of lake of semi-fluid material, which being disturbed in one part is disturbed in all, and is ever fretted into a fluctuating pattern of stationary waves, the resultant of old waves reflected from the shore (what is the shore?) meeting new ones arising at the centre. According to Mr. Lewes, "there is no consciousness (in the restricted meaning of the term) unless the whole organism is involved." This is, perhaps, the simplest way of getting a "physical basis" for the supposed unity of consciousness, and Mr. Lewes's exposition of it in the next essay is very taking. Still it would not be the only way, even were it established that the nervous system is so continuous that an excitation in one part affects the whole. In proof of this continuity Mr. Lewes mentions the development of the cerebro-spinal axis from one continuous canal. But this surely proves too much; for the whole organism was once continuous; and, besides, might one not with more reason urge that in a complex organism the consensus of its constituent "organites" never could be absolutely complete? There may be thousands of these constituent units of the nervous centres that have never matured at all, and thousands more so far isolated from the rest as never to be indirectly excited. A further support for his position Mr. Lewes finds in the very questionable assumption that the neuroglia is also nerve-substance, and not, as generally held, merely connective tissue. Nay, so bent is he on securing this continuity that he even thinks the physical state of the central organs may suffice.

"In a semi-fluid substance, such as neurine [a term Mr. Lewes misappropriates for nerve-substance] continuity may be perfect without solid fibres: the amorphous substance and the plasmode may as well transmit waves of molecular motion from one part of the tissue to another, and, therefore, from cell to cell, or from cell to fibre, as a figured substance may. When the posterior root enters the grey substance of the cord, there is no more necessity for its fibres passing directly into the cells of that grey substance in order to excite their activity than there is for a wire to pass from the bell to the ear of a servant, who hears the vibrations of the bell through the pulsations of the intervening air upon her tympanum" (p. 271).

No wonder he thinks there is no rational interpretation of the cell, and concludes that "possibly the cells are the nutritive sources of the fibres." But the following is a yet more singular proof of the lengths to which Mr. Lewes's continuity doctrine has carried him:—

"If the eye is fixed steadfastly on a particular colour during some minutes, the retina becomes exhausted, and no longer responds to the stimulus of that colour: here the stimulation is, of course, centripetal. But if, instead of looking intently on the colour, the mind (in complete absence of light) picture it intently, *this cerebral image is equally capable of exhausting the retina*; and unless we believe that colour is a cerebral, not a retinal, phenomenon (which is my private opinion), we must accept this as a proof of a centrifugal excitation of a sensory tract."

Now, as is well known, in the first case, if the colour be red, for example, and after a time be replaced by white, this will appear green: has Mr. Lewes found after shutting his eyes and thinking intently of red that on opening them white appears green?

JAMES WARD.

SOCIÉTÉ DES ANCIENS TEXTES FRANÇAIS.

Miracles de Notre Dame, par personnages. Publiés par G. Paris et U. Robert. Tome II. (Paris: Didot.) *Aiol*, chanson de geste. Publiée par J. Normand et G. Raynaud. (Paris: Didot.) The first of these volumes, which contains the text only of eight miracle-plays, the second fifth of the collection, may be dismissed for the present with an enumeration of their titles (*S. Guillaume du Desert*, *L'Evesque a qui N. D. s'apparut*, *Un Marchant et un Larron*, *La Marquise de la Gaudine*, *L'Empereur Julien*, *Un Prevost que N. D. delivra*, *Un Enfant que N. D. resuscita*, *La Mere du Pape*), and a reference to the ACADEMY of March 10, 1877 (vol. xi., p. 210). Of the romance of *Aiol*, the text has recently been published in Germany by Dr. W. Förster, who has chosen to consider himself aggrieved by the society not confiding their edition to him; but as it is without introduction, notes, and glossary, the present editors' work is really original. The poem, which exists in but one manuscript, and contains about eleven thousand lines in assonances, relates the adventures of Aiol in reacquiring for his father the unjustly forfeited family honours and estates, and in bringing home a Saracen princess, whom he captures on his travels, converts, and marries; much of its story is commonplace, but the hero and heroine are agreeable and well-drawn figures. It is divided by the versification into two parts, the first and smaller being in ten-syllable lines, the other in twelve; the editors show that the first part is the older, and was originally in the Central French dialect, while the second has been much altered and expanded by a Picard writer of the beginning of the thirteenth century. The original decasyllables present a remarkable feature, shared by very few other poems, in having the caesura at the sixth syllable instead of the fourth; this gives such lines as *Le glouton egarda | si fist autel*, and, with the additional unaccented syllable at the caesura, *Alquant s'en retourner | qu'en ont pitié*. The editors, who have had the valuable aid of M. G. Paris, discuss in their excellent Introduction the often difficult questions raised by the poem, whose hero they identify with Hélie, Count of Maine, who died in 1110; their Glossary is very complete, containing all the words which might perplex a modern reader; and the MS. reading is given wherever they have altered the text. Altogether this important book is a very satisfactory presentation of a work which enjoyed considerable celebrity at home and abroad, and offers abundant and varied interest to all concerned with early French literature.

HENRY NICOL.

SCIENCE NOTES.

ASTRONOMY.

Lohrmann's Moon Charts.—After delays and vicissitudes extending over half a century Lohrmann's charts of the moon have at last been published. Lohrmann was the first observer who undertook the difficult task of furnishing an adequate representation of the topography of the moon's visible hemisphere, based upon actual measurements. Provided at the "Mathematische Salon" at Dresden, where he was engaged, with instruments of sufficient power for the prosecution of his intended work, he began his labours in 1821, and published in 1824 the first part of his *Topographie der sichtbaren Mondoberfläche*, in which he gave a full account of the methods employed in the observations and computations, and a description of the four sections of the map which accompanied the part. The whole chart was intended to consist of twenty-five such sections, forming, when put together, a disc of three Paris feet, or of more than thirty-eight English inches, diameter. Though the obvious merits of Lohrmann's work, in comparison with what had been done before him, were acknowledged, and though its completion was much desired by some astronomers, Lohrmann was hampered by externa

difficulties and the want of adequate support in going on with the publication of the other sections, and a general chart on a smaller scale, published in 1838, was all that had become publicly known of his later labours, when, in 1840, he suddenly died, at the age of forty-four years. Meanwhile Mädler had, in 1830, begun his similar but independent work at Berlin, at the private observatory of W. Beer (a brother of Meyerbeer), and had, in the autumn of 1836, published his complete "Mappa Selenographica," drawn on the same scale as Lohrmann's, but produced by lithography instead of being printed from copper-plates. Mädler had also given a full description of his work in his book *Der Mond*, and had likewise published a general map on a small scale. However desirable it appeared that Lohrmann's work should not be withheld from publicity, so that the results of his and of Mädler's labours might serve as checks upon each other, the obstacles in accomplishing the undertaking were of the gravest kind, as there were at first neither the services of a competent observer of the moon to be had for properly editing the whole work, nor was there any prospect of the necessary support for its technical execution and for its publication, since Lohrmann had published the first part at his own risk and expense. Under such circumstances the work would have been practically lost to science, if two gentlemen, Barth and Opelt, persuaded of its high value, had not considered it a matter of honour to do their best to make it accessible to the scientific world. Barth, a former head of the publishing firm of that name at Leipzig, supplied the funds for going on with the engravings, and Opelt, an old friend of Lohrmann's at Dresden, who had before made the calculations for deducing from the measurements the selenographical positions of the lunar spots, superintended the proceedings. In 1851 J. Schmidt, the present director of the observatory at Athens, but at the time still at Bonn, undertook the writing of the explanations, and the general editing, and the steady progress of the undertaking seemed at last secured, when the death of Barth in the same year brought it again to a stop. Repeatedly resumed, after being repeatedly interfered with by other calamities and obstacles, the work has at length, after so many vicissitudes, been accomplished. Lohrmann's original pencil-sketches could not be found. The twenty-five sections of the chart have been carefully drawn by him with pen and ink, and the colouring is indicated by tinting and by numbers. The engravers have worked according to these drawings, which are now deposited at the Leipzig Observatory. But as the copper-plates have been prepared in the course of half a century by five or six engravers, and as, moreover, the original drawings tinted by Lohrmann himself fail in many parts to express the proportion of brightness correctly, the result is a sensible inequality in the tints of the plates, which could not well be mended. In Schmidt's description of the twenty-five sections he has pointed out in his running commentary the chief failings and mistakes in the plates, and he has thereby done good service. But, whatever the shortcomings and errors of Lohrmann's work may turn out to be, the work will retain permanent value as a salutary check upon Mädler's contemporary labours, and it will accordingly be welcomed by all who are interested in selenographical studies.

Determination of the Diameters of the Satellites of Mars at the Observatory of Harvard College.—The announcement of this determination has naturally raised the question, What methods have been employed for effecting it? The answer to which has been furnished by Prof. Pickering, the present Director of the Observatory, in his Annual Report. Among the different fields of scientific work for his excellent 15-inch refractor, he has selected photometry as that to which the greater portion of the time of the telescope will be devoted. In attacking the general problem, it was necessary to invent a suitable instrument, to have it constructed

and attached to the telescope, and to learn its capacities and defects, before useful observations could be obtained. Early in August of last year a photometer was made by attaching to the eye-piece of the telescope a Nicol prism and double-image prism. By the last of these, two images of any object are formed; and, by turning the Nicol prism through an angle given by a graduated circle, the relative brightness of the images may be altered in any desired proportion. Accordingly, if turned towards a double-star the faint image of the bright component may always be reduced to equality with the bright image of the faint component. Various double-stars were thus measured, and the satellites of Jupiter were compared with each other. When the news of Prof. Asaph Hall's discovery of the satellites of Mars arrived, a problem of unusual difficulty offered itself for the new photometer. The first attempt to measure the light of the satellites was made on August 27, by allowing Mars to shine through a very small hole placed in the focus of the telescope, and comparing this with the satellite. To obtain a hole sufficiently minute and circular was a matter of no small difficulty. Several gentlemen made the effort, and Mr. Van Woerd, Superintendent of the American Watch Company, at length completely solved the problem by the construction of a hole one eighteen-hundredth of an inch in diameter, and so nearly circular that the various diameters, including errors of measurement, only differed one hundred-thousandth of an inch. Even this hole, however, represented a satellite seventy miles in diameter, and shone out as a bright star when Mars was placed behind it. Many comparisons of this and other holes with the satellite were obtained as described above. But the loss of light by the polarising prisms rendered it a matter of extreme difficulty to see the satellite with the photometer on, even when it was easily visible with a common eye-piece. As it was, moreover, desirable to obtain measures by several different methods, a wholly different photometer was next tried. A small auxiliary telescope was attached to the large instrument, and by means of prisms the light of Mars was reflected so that its image formed by the little telescope should be seen by the side of the image of the satellite formed by the large telescope. The satellite seen with 15-in. aperture was still fainter than Mars, seen with a telescope having an aperture of less than a quarter of an inch. It was now easy to reduce the light of the small telescope with two Nicol prisms, so that Mars should appear not brighter than its satellite. To obviate any error due to the inequality in the light of the backgrounds on which Mars and its satellite were seen, artificial light was thrown into the small telescope, and, after various trials, almost perfect equality of the two backgrounds was obtained. There appeared then two stars on fields which were first rendered equally bright, then matched in colour, and the image of Mars was then brought to precisely the same brightness as the satellite. Many comparisons of both satellites with Mars were thus made. It was noticed under these favourable opportunities for comparison that the outer satellite did not possess the red colour of Mars—a curious result, and having an important value in any theory of the cause of the peculiar colour of the planet. Still a different method was tried for comparing the two satellites directly with one another. One or more plates of thin glass were successively interposed between the eye and the inner satellite; and its light was thus so far reduced as to render it equal to, or fainter than, that of the outer and smaller satellite. These observations have not yet been wholly reduced, and, therefore, only approximate results can be given. If the satellites reflect light in the same proportion as the planet, the light of the outer satellite compared with that of the holes indicates a diameter of about 5.9 miles; while the

second method gives about 5.4 miles. The light of the inner satellite indicates a diameter of 6.2 miles. The direct comparison of the two satellites gives the ratio of their diameter as 9 to 10. As the darker colour of the outer satellite somewhat diminishes its light, Prof. Pickering considers it probably safe to reckon the diameter of the outer satellite as about six miles, and that of the inner one, seven. In allowing the plausibility of the probable correctness of these approximate deductions it is presumed that all necessary precautions have been taken in guarding against erroneous and fallacious inferences, and that the various constants involved in the reductions have been determined with the requisite critical care and circumspection.

Atlas coelestis eclipticus Eduardi Heis.—In order to provide observers of the zodiacal light with convenient means for tracing the outline of the light, the late Prof. Heis has constructed the simple atlas which has now been published posthumously under the above title. It consists of eight maps, showing the stars down to the fifth magnitude, along and near the zodiac, and seems well adapted for its intended purpose.

CHEMISTRY AND MINERALOGY.

Persulphuric Acid.—Berthelot has prepared a new acid of sulphur (*acide permulphurique*), corresponding in composition with perchloric and permanganic acid, by the discharge of electricity of high tension through a perfectly dry mixture of equal volumes of sulphurous acid and oxygen; sulphuric acid combines neither with oxygen nor with ozone under similar conditions. The electrolysis of concentrated sulphuric acid also yields the new acid in a state of solution. It can, moreover, be prepared in a state of solution by cautiously mixing a solution of hydrogen peroxide with sulphuric acid, concentrated or diluted with not more than one equivalent of water; when two equivalents are present no reaction takes place. In the last-mentioned case the reaction appears never to be complete, a portion of the hydrogen peroxide always remaining unchanged. The anhydrous persulphuric acid is most readily prepared by allowing the discharge to take place for eight or ten hours through the tubes constructed for such processes, by which time their interior is found to be covered with drops of a viscous liquid; at 0° it becomes solid and is crystalline; in places it has a granular structure, in others thin transparent needles are seen traversing the length of the tubes; brilliant scales are also observed attached to the glass. The acid resembles anhydrous sulphuric acid; the latter substance, however, forms opaque crystals which are shorter, much finer, and narrower than these. At 10° persulphuric acid has a vapour-tension of several centimètres, and sublimes spontaneously from one part to another of the tube in which it is preserved. Its composition was determined both by synthesis and analysis. After the two gases had entered into reaction the residue was removed from the tube by means of the Sprengel pump and measured: if the change takes place in accordance with the following equation, the residue should be one-eighth of the gas consumed:—

In two experiments the numbers 8.2 and 7.9 were arrived at in place of the ratio 8:1. Four volumes of sulphurous acid and three of oxygen, therefore, appear to combine to form persulphuric acid:—

The acid was analysed by several methods: by using a standard solution of tin chloride, estimating the change by means of potassium permanganate, and subsequently determining the sulphuric acid as barium sulphate; again, by employing a standard solution of ferrous sulphate, and afterwards observing the amount of a standard solution of permanganate required to complete the oxida-

tion; also by the use of potassium iodide and hyposulphite, as well as by the employment of sulphurous acid and potassium iodide. Each process gave numbers which indicated the formula S_2O_3 , as that of the new acid. At 0° , or at temperatures near zero, the acid may be preserved for some days; it is not a stable compound, however, and after the lapse of fourteen days commences to spontaneously decompose; the aqueous solution very rapidly undergoes decomposition; when dissolved in concentrated sulphuric acid the change is retarded; in this case also oxygen is slowly evolved, and at the end of six weeks the new acid is completely destroyed. An application of heat causes it to separate into sulphuric anhydride and oxygen. It develops dense fumes in contact with air, atmospheric moisture being absorbed and hydrated sulphuric acid formed. Dissolved in concentrated sulphuric acid it appears, as has already been stated, to have the power for a time of resisting decomposition; the solution, after the lapse of the first twenty-four hours, appears, from the results of volumetric analyses, to have undergone no appreciable change. When placed in contact with baryta water a portion of the acid apparently escapes decomposition and barium persulphate is produced; the salt, which could not be analysed, is soon converted into ordinary sulphate, oxygen being evolved. Persulphuric acid does not oxidise arsenious acid or oxalic acid in the cold, and in this respect it closely resembles hydrogen peroxide; it shows a marked difference from that body in other reactions in that it is unable to form perchromic acid and does not reduce potassium permanganate. The author concludes his very interesting paper with some speculations on the relations of the oxides of sulphur to those of other non-metallic and of metallic elements, and promises to employ his method in the investigation of the higher oxides of other substances (*Compt. rend.* lxxvi., 20).

The Crystallisation of Lime, Strontia and Baryta.—Brügelmann describes the chemical and physical characters of these oxides when in a crystallised condition (*Ann. der Chemie und Physik*, ii., 466). The crystals are formed when the nitrate of the metal, enclosed in a porcelain flask or retort, is submitted to the very high temperature of a furnace fed with coke. All three of the oxides form crystals belonging to the regular system, and they are invariably found to be cubes; in the case of lime, crystals having an edge one millimetre in length have been observed. As a rule the residue, left when a nitrate is treated in the manner described, has a vesicular or foliated appearance, and is apparently an entirely amorphous mass; a low power, however, is sufficient to show that it is made up of crystals. An examination of crystals of each of the three oxides in polarised light confirmed the observation that they all belong to the regular system. The lime produced from the nitrate is far less readily subject to change when exposed to the action of moisture or carbonic acid than that obtained by heating marble. The crystals can be exposed to the air for many days without undergoing change, and to water or moisture for several hours before they fall to powder. That the materials in the hands of the author were pure oxides is proved by his analyses, which showed them to consist respectively of 99.64 per cent. lime, 99.4 per cent. strontia and 99.32 per cent. baryta.

Revision of the Atomic Weight of Antimony.—J. P. Cooke has determined anew the atomic weight of this metal, and has devoted to that purpose much time and great care. He first found the weight of antimony sulphide, Sb_2S_3 , obtained from a known amount of antimony, taking the atomic weight of sulphur as 32. The red variety was dried at $180^\circ C.$, and the grey modification, in most instances, at 210° . A mean of thirteen experiments where the sulphide was dried at 180° furnished the number 119.94, and a mean of eleven others where the compound was heated to 210° gave 120.295 as the number representing

the atomic weight. In each case the author convinced himself that no free sulphur was present, and he took precautions to eliminate every possible source of error. In a second series of no less than seventeen estimations where antimony chloride, $SbCl_3$, was employed, the atomic weight of the metal was found to be 121.94, a number which closely corresponds with that obtained by Dumas and Dexter. In this case, it should be stated, the atomic weight of chlorine was taken to be 35.5, and that of silver to be 108. As each of the two series of experiments made by Cooke furnished numbers which correspond closely *inter se*, while the final results differ considerably, the author set himself to determine the atomic weight of sulphur. By reducing silver sulphide at a low red-heat with dry hydrogen he found sulphur to be 32.158 if silver is 108, and 32.137 if silver is 107.93. Stas held the atomic weight of sulphur to be 32.074 if silver be regarded as 107.93. In a fourth series of examinations, Cooke determined the amount of bromine in antimony bromide, $SbBr_3$, and obtained the number 120 as a mean of fifteen analyses. When he employed antimony iodide he again arrived at the number 120, if the atomic weight of iodine be taken to be equal to 127 and that of silver 108; or 119.95 when the atomic weights of those elements are respectively held to be 126.85 and 107.93. The correct number appears to be 120, and the disparity appears to have arisen from the fact that it is impossible to prepare antimony chloride absolutely free from oxychloride (*Amer. Jour. Sc.*, 1878, xv., 41).

Quartz and Tridymite.—Sandberger describes some curious crystals of quartz from the Friedrich-Christian Mine at Shapbach, which enclose spherules or partial spherules (hemispheres), white and opaque, of the size of a millet seed, and consisting of silicic acid. When examined under the microscope in polarised light they proved to be small masses of opal surrounded with little crystals of tridymite. The tridymite is here found associated with copper pyrites and dolomite and other minerals, and the observation is of interest as affording confirmation of Verba's statements regarding the occurrence of tridymite in quartz (*Jahrbuch für Mineralogie*, 1878, 47). While studying the minerals of the Rocher du Capucin, near Mont Dore, last autumn, Des Oloizeaux remarked the occurrence of crystals of hypersthene, tridymite and zircon in the druses of the trachyte of that locality. He found that the tridymite readily undergoes change. Blocks of stone, hewn in the preceding spring, contained crystals of that mineral which had become altered, white and partially destroyed, the hypersthene remaining unchanged. In one locality he found a geode filled with crystallised or rather crystalline, doubly refractive quartz, much fissured and easily friable, resembling that from Radicofani, associated with which were a number of crystals of tridymite (*Jahrbuch für Mineralogie*, 1878, 46).

Plain Words about Water.—This is the title of a pamphlet by Prof. Church published for the Committee of Council on Education (Chapman and Hall). It has for its object to present a short account of water in relation to the nourishing of man's body. The brochure has been written with the view of being practically useful to persons unacquainted with scientific terms, and is one of a series of small books the preparation of which the Lords of the Committee of Council on Education have sanctioned with the object of making the Food Collection at Bethnal Green better known, as well as to bring home to everyone some of the most important facts about the sources, constituents, and uses of food. Prof. Church's pamphlet treats of water as part of the human body, water as our daily food, of water supply, how to try or test waters, and how to purify waters. The little work is written in a plain homely style which all will understand, and deals with domestic subjects the importance of which cannot be overrated,

especially by those who do not enjoy the advantage of such drainage as we have in London. One quotation will suffice:—

"In a country town in a back lane was a small yard with several cottages. At the end of the yard stood a pump. From this was drawn occasionally a scanty supply of a liquid miscalled water. At last it failed. The explanation was soon found. The owner of the adjoining house had cut off the supply of water from a water-closet, putting an earth-closet in instead. Since that change the water in the yard pump fails, except in very wet weather."

Pandermite.—Vom Rath has given this name to a lime borate which occurs in the form of rounded nodules, associated with gypsum, in a bed of clay slate at Panderna, on the Black Sea. The new mineral resembles a snow-white finely-grained marble, and appears to have a composition expressed by the formula $2CaO, 3B_2O_3, 3H_2O$, and to be nearly related to the borocalcite of Toscana and Iquique (*Jahrbuch für Mineralogie*, 1878, 75).

SANDBERGER communicated to the last *Naturforscherversammlung* a paper on the occurrence of traces of heavy metals in the minerals of the rocks enclosing metallic veins. Several specimens of olivine, hornblende, augite and mica were observed to contain, in the form of silicates, traces of the metals which entered largely into the composition of the metallic minerals traversing or associated with them. In the picryte from the Carpathians and serpentine derived from it a small amount of nickel and a still smaller quantity of cobalt was met with; copper occurs in the olivine of Naurod and of the Ulenthal, and in the palaeo-picryte of the Fichtelgebirge and of Dillenburg; the latter mineral contains, moreover, a trace of bismuth. In hornblendes and augites copper and cobalt were found; specimens from Andreasberg were examined and the presence in them of traces of lead, antimony, arsenic and nickel were recognised. Some micas contain as constituents lead, copper, cobalt and bismuth, while in that forming a constituent of the gneiss of Hürstein the presence of arsenic was detected (*Ber. deut. chem. Gesell.*, January 14, 1878, 2233).

THOMS, of Riga, has directed attention (*Ber. deut. chem. Gesell.*, January 14, 1878, 2234) to the occurrence of a white deposit in teak wood (*Tectonia grandis*), consisting essentially of lime phosphate, $PCaHO_4$. His views in regard to this deposit were confirmed, it is stated, by his finding 20.6 per cent. of phosphoric acid in the ash of the wood. A chemist of this country made the same observations sixteen years ago, and they are playfully recorded in a rhyme published at the time:—

"Or, when dyspeptic and exceeding weak,
Will read on salts phosphatic, found in teak."

E. SCHMIDT, of Halle, has investigated afresh Reichardt's mercurialine, the volatile base occurring in *Mercurialis annua* and *perennis*, and finds it in all its characters to be identical with methylamine (*Ber. deut. chem. Gesell.*, January 14, 1878, 2226).

THOSE who take an interest in the very important investigations which have recently so successfully been made, and to which we have already directed attention, respecting the liquefaction of the so-called "permanent" gases, will be glad to know that M. Raoul Pictet has published an illustrated *Mémoire sur la Liquefaction de l'Oxygène, la Liquefaction et la Solidification de l'Hydrogène, et sur les Théories des Changements des Corps* (Genève: J. Sandoz, 1878).

MEETINGS OF SOCIETIES.

ROYAL SOCIETY.—(Thursday, February 28.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On certain Definite Integrals," by W. H. L. Russell; "On the Reversal of the Lines of Metallic Vapours," by Profs. Liveing and Dewar; "Contributions to the Physiology of Batrachian Lymph Hearts," by J.

Priestley; "On the Structure of the Stylasteridae, a Family of the Hydroid Stony Corals," by H. N. Moseley.

SOCIETY OF ANTIQUARIES.—(Thursday, February 28.)

LORD CARNARVON in the Chair. Mr. Freshfield read a paper on the effect of Byzantine influence on the capitals of the pillars of certain churches in Italy. The Byzantine style of architecture originated in the reign of Justinian, and the most important existing churches are, in order of date—SS. Sergius and Bacchus, or, as the Turks call it, the Lesser S. Sofia; S. Vitalis at Ravenna; S. Sofia; S. John at Ephesus; then other churches in Constantinople; and, lastly, Eski Djouma at Salonica. The designers of the capitals in these churches seem to have taken the acanthus leaf as a model, and until the middle of the fifth century it is used as in the Corinthian style, with the tips falling over; but at that date it is represented as if clinging to the capital, and in the church of SS. Sergius and Bacchus the falling leaf has quite disappeared, though Greek influence is still visible in the Ionic shape of the capitals in the upper storey of the church. In S. Sofia the leaf has quite lost the acanthus character, and is arranged more like a fern. The same class of capital is also seen at Ravenna, and in a church at Padua, which was once the cathedral, but occurs in no building after the time of Justinian. Mr. Freshfield exhibited photographs of all these churches and of the capitals to which he referred, and calling attention to the great similarity in the design, stated it as his opinion that these churches both in the East and in Italy were designed by the same architect. Some discussion ensued, in which Sir Gilbert Scott, Prof. Donaldson, and Mr. Hayter Lewis took part.

ROYAL ARCHAEOLOGICAL INSTITUTE.—(Friday, March 1.)

COLONEL PINNEY, V.-P., in the Chair. The Rev. J. Fuller Russell read some "Notes on Elizabethan Communion Plate, in regard especially to the Substitution of 'Decent Cups' with 'Covers,' for 'Massing Chalices' and 'Patens.'" The author treated at some length upon the prohibition of the eucharistic use of the chalice and paten—"the massmongers' trinkets"—by Parker and Grindall, giving many illustrations of the introduction of cups and covers in their stead. The change in the form of the new vessel was alluded to, and many interesting extracts given from works of the period and churchwardens' accounts. —Mr. J. T. Micklethwaite spoke of the gradual change in the shape of the chalice between the thirteenth and sixteenth centuries, and mentioned the peculiar propriety of the chalice to its purpose, which had more to do with the substitution of the communion cup for it than any necessity for a larger vessel. —Mr. W. M. Flinders Petrie gave an account of a remarkable vertical shaft 142 feet deep, communicating with a large chamber cut in the chalk; this had been lately discovered accidentally on the property of Mr. T. Jackson in Eltham Park. Many theories were presented to account for its use and date, but none seemed quite to fit the case. Various objects of antiquity, including an iron workman's candlestick for driving into the wall, were exhibited. It is proposed to make a thorough examination of the chamber with the object of ascertaining its date and use. —Mr. C. Keyser read a paper "On the Mural and Decorative Paintings in Canterbury Cathedral," and gave a careful account of the past and present condition of these pictorial remains. The chapel of St. John the Baptist received—as so surprising a display of painting of an early period there exhibited deserved—special and detailed notice. Mr. J. G. Waller remarked upon the religious teaching of wall-paintings, and the lessons which they conveyed to the ignorant, of whom they were the book. —Mr. Bernhard Smith exhibited a beautifully-worked dagger for the duel, dated 14 Elizabeth, and a narrow, polished flint celt, lately found in London. —Mr. Hartshorne sent a pair of jungle spurs, of Peruvian work. —Mr. F. J. Skill exhibited a model of a font formerly existing in Rotherham church. —A fine inlaid basket-hilted sword of the time of Charles I. came from the collection of Captain Hartshorne.

PHYSICAL SOCIETY.—(Saturday, March 2.)

PROF. W. G. ADAMS, President, in the Chair. Mr. Sedley Tayler exhibited the colours produced in thin

films by sonorous vibrations. A piece of thin brass perforated with a triangular, circular, or rectangular aperture, and bearing a thin film of soap solution, was placed horizontally on one end of an L-shaped tube: the beam of the electric lamp, after reflection from it, was received on a screen. It was shown that when a sound is emitted in the neighbourhood of the open end of the tube, the film takes up a regular form, which is indicated by the different colours of the reflected light, and each note has its own particular colour-figure; and, further, with different instruments we have different figures. Thus, when a square film was employed, a kind of coloured grating was the result, which was modified by changing the note; and with a circular film, concentric rings traversed by two bars at right angles were observed. —Mr. W. H. Preece exhibited and described the Phonograph. After referring to the manner in which the preceding communication bore on the subject of the telephone, he went on to explain the construction of the two instruments exhibited, which have been made in accordance with the published accounts of the apparatus and details received from the inventor, Mr. T. A. Edison, by Mr. Pidgeon and Mr. Stroh respectively. In the first of these, the receiving and emitting discs are distinct, the former being of ferrotype iron and the latter of paper, whereas in the second form of apparatus both these functions are performed by one and the same disc of iron. They also differ in that in Mr. Pidgeon's apparatus the drum receives its motion by hand; and in that of Mr. Stroh a descending weight is caused to communicate motion by a suitable train of wheels, which motion can be controlled and regulated by an adjustable pair of vanes. In both cases the drum is of brass, traced over by a spiral groove, and the whole is mounted on a screw of the same pitch. The manner of using the phonograph is extremely simple. The drum having been covered with tinfoil, a uniform movement of rotation is given to it, and a fine metal point, firmly fixed to the centre of the receiving-plate, is brought in contact with it, care being taken to place the point accurately over the groove. If now this plate be sung or spoken to, the tinfoil will be indented in accordance with the vibrations communicated to the plate. The emitting-plate having been provided with a resonator, its point is now brought into the position initially occupied by the point of the receiving-plate, and on rotating the drum with the same velocity, fairly identical sounds are given out. It will be seen that Mr. Stroh's apparatus has an advantage over that of Mr. Pidgeon in that it secures a constant rate of rotation; but, on the other hand, the sounds emitted by the paper disc appeared to be more distinct than those from the iron. A number of experiments were performed with the instruments. The sounds were reproduced at times with remarkable distinctness; and when Mr. Spagnolletti and Mr. Sedley Taylor sang "God save the Queen" as a duet through a double mouthpiece, the two voices could be clearly distinguished on its being reproduced. It was shown that even when an indented sheet of tin-foil has been employed to emit sounds, it retains its form with such perfectness that the sounds can be reproduced by means of it a second and even a third time with nearly equal distinctness. Prof. Graham Bell pointed out that the articulation of the instruments was very similar to what he had observed in the earlier forms of the telephone; and he had no doubt, judging from his own experience of that instrument, that the phonograph will ere long be so adjusted as to articulate much more perfectly. He anticipated that the quality of the sound would be found to vary as the rate of rotation was altered, as well as the pitch, and this proved on experiment to be the case.

MUSICAL ASSOCIATION.—(Monday, March 4.)

R. H. M. BOSANQUET, Esq., in the Chair. The memorial to the trustees of the British Museum about the state of the musical library there was read and passed. —The adjourned discussion on Mr. Blaikley's paper on brass instruments took place. Mr. Blaikley gave a summary of his paper, and explained that the cause which makes instruments constructed with conical tubes deviate from the harmonic series, is the necessity of fitting the cones with a tube for blowing. The first three notes of one such combination had the ratios 1, $\frac{1}{2}$, $\frac{1}{3}$; the ratio of the third and second notes being greater than that of the second and first. In double-reed instruments, such as the oboe, this de-

fect is scarcely sensible. The Chairman remarked that Mr. Blaikley's method of determining notes by immersion is new, and likely to supersede the methods in use. The enunciation of the law that the resonance note of a brass instrument is the same as its sounding note is another matter of importance. Lord Rayleigh established the fact in the case of an organ lip-pipe some time ago, and the Chairman himself had recently established it for the oboe and clarinet. But it is not universally the case, for organ reed-pipes follow a different law, and the theory is of interest. Dr. Stone stated that the contrabassoon was successfully constructed with a tube of truly conical bore, but that in bassoons he had found it necessary to use portions of three different cones. —Dr. Stone exhibited a Scheibler's tonometer, made with ordinary tuning-forks; also a clarinet with nineteen notes to the octave; and a bassoon with additional notes. —Mr. Ellis gave an account of his recent researches in tonometry.

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, March 5.)

PROF. NEWTON, F.R.S., V.-P., in the Chair. The secretary read a Report on the additions made to the society's menagerie during the month of February. —Mr. Slater exhibited and made remarks on a second collection of birds from Duke of York Island, New Britain and New Ireland, which he had received from the Rev. George Brown; and on a specimen of *Athenae variegatae* and the type-specimen of *Fulica gallinuloides* of King, belonging to the Museum of Science and Art, Edinburgh. —Prof. Newton drew attention to the statement of Leguat that every Solitaire (*Pezophaps solitaria*) carried a stone in its gizzard, and exhibited one of three stones found by Mr. Caldwell, associated with the remains of as many birds of that species in the caves of Rodriguez. —Mr. J. T. Parker described the stridulating apparatus of *Palinurus vulgaris*, which consisted in a peculiar modification of the second joint of the antennae working against the lateral surface of the antennular sternum. —A communication was read from Mr. C. Spence Bate, containing an account of the Crustaceans of the coast of Coromandel, collected by Sir Walter Elliot. —M. A. Boucard read notes on some Coleoptera of the genus *Plusiotis*. —A communication was read from Mr. A. G. Butler, containing an account of a small collection of Lepidoptera, obtained by the Rev. S. J. Whitmee, at the Ellice Islands. —A communication was read from Mr. E. J. Miers, on the *Penaeidae* in the collection of the British Museum. —Mr. G. French Angas read the description of a new genus of land shells belonging to the family *Cyclophoridae*, for which he proposed the name of *Mascaria*; and of nine new species of land and marine shells from various localities, among which was a new *Rostellaria*, which he proposed to name *R. luteostoma*, and a new *Bulinus* from Madagascar, to be called *B. Wateri*. —Communications were read from Dr. G. E. Dobson, containing additional notes on the Chiroptera of Duke of York Island and the adjacent parts of New Ireland and New Britain; and from Mr. Robert Collett, containing an account of *Latrunculus* and *Cratologobius*, two remarkable forms of Goboid fishes found in Scandinavia.

NEW SHAKESPEARE SOCIETY.—(Friday, March 8.)

FRANK A. MARSHALL, Esq., in the Chair. Mr. H. Courthope Bowen read a paper on *As You Like It*. After a few remarks on the methods we should pursue and the object we should have in fixing the date of a play, Mr. Bowen confirmed Malone's opinion that *As You Like It* was written (at least in part) in 1599; he also agreed with Mr. Aldis Wright that the stay of publication in 1600 was probably due to the play's being unfinished. He then sketched, partly from fact and partly from fancy, Shakspeare's external life at this time, and endeavoured by means of the play to catch a glimpse of his inner life, showing that the difference between town and country, and town-folk and country-folk, occupied his mind considerably at this period, during which we know he was establishing himself at Stratford. Mr. Bowen then discussed the faults of the play as a play, pointing out several signs of haste and incompleteness, especially in the bad characters, and in the last scene. He then turned to consider the prominent characters in *As You Like It*, and dwelt much on the perfect skill and knowledge of human nature shown in Rosalind, Orlando, Touchstone, and Jaques. The exiled Duke he considered "an idling sentimentalist."

FINE ART.

THE ENGRAVED WORK OF TURNER AT THE FINE ART SOCIETY.

IN a second room at the Gallery of the Fine Art Society in Bond Street, there is exhibited, at the instance of Mr. Ruskin, that collection of the engraved work of Turner of the existence of which bare mention was made when the drawings were spoken of last week. From an early period of his life, onward to a very late, Turner was accustomed to furnish the engraver with subjects for his art; and probably there never was a painter who brought himself into such intimate relation as did Turner with all the best engravers of his day, or who in so very many cases superintended with minute care the engraving of his work. Of course many of the early prints from Turner's designs were executed at a time when the publications of which they formed a part could not hope to enlarge their circulation by the attractions of a name not then famous. Turner, like any other comparatively ill-paid artist, was simply commissioned to execute such a drawing as chanced to please the publisher, and the design so made was engraved, it may be in such a publication as the *History of Whalley*, or, it may be, as head-piece to an Oxford Almanack for which Turner worked during twelve years of early manhood. But in 1807 his art had assumed so great an importance, and so calmly certain was he of its range and worth, that he began the issue of the *Liber Studiorum*, in parts published at irregular intervals, each part containing five prints, and not four, as Mr. Huish, in momentary error, writes in the instructive notice he has appended to the Exhibition Catalogue. *Liber Studiorum*, unlike any other series of Turner's work, was executed in etching and mezzotint: the leading lines etched generally by himself, with a rare union of power and delicacy, and the mezzotint being added in a few cases by himself, but in most by the mezzotint engravers of already admitted skill, such as Lupton, Dunkarton, Say, and Charles Turner. The visitor should notice the brilliant examples lent by Mr. Ruskin and Mr. Brooke. Of the very first-rate subjects "Severn and Wye" is almost the only one that is absent. In 1819, the publication of *Liber Studiorum*, as writings upon the subject have mentioned, was arrested—not completed; for the rare prints afterwards to be accounted as very precious treasures were in Turner's lifetime disregarded. But five years before the cessation of *Liber*, Turner had begun to be the principal designer for a book of smaller, yet very considerable, worth—a book of line-engravings this time—*Picturesque Views on the Southern Coast of England*, of which one of the most admirable ornaments, the "Lyme Regis," engraved by W. B. Cooke, is to be seen in the Exhibition. This series was, in due course, brought to completion; and it is singular that it is almost the only great venture in popularising the art of Turner by means of engraving which arrived at its legitimate close.

It was now the turn of unaided mezzotint to be tried; and in 1826 Thomas Lupton was engaged to engrave, in his medium alone, the *Ports of England*. This enterprise, though to it we owe such an exquisite mezzotint as the "Scarborough," was commercially unsuccessful, and concluded abruptly—indeed, an author generally intelligent writes, I see, in the current number of the *Portfolio*, as if no issue whatever had taken place till Mr. Ruskin's in 1856; but that late issue was principally of plates worn, and possibly retouched—the prints dating from thirty years earlier (of which Mr. Hamerton would appear to be unaware) alone showing the engraver's work in its earliest and fine condition. The next venture (1827) was to be a great work in line-engraving—the *Picturesque Views in England and Wales*, engraved under the superintendence of Heath. It stopped short when about four-fifths of its intended course was accomplished. For it some of the finest coloured drawings of

the master, in his finest time, had been executed: the great *Flint Castle*, for instance, now exhibiting downstairs—a subject repeated with variations in *Liber*—and Mr. J. E. Taylor's *Llanthony Abbey*, which we had occasion to speak of in noticing the treasures of the Grosvenor Gallery. The *Chain Bridge over the Tees*, engraved by W. R. Smith for the *England and Wales*, and exhibited at the Fine Art Society's rooms, is one of the most accomplished pieces of line-engraving done in the nineteenth century: the skill with which such various distances, such subtle gradations of atmosphere, are realised being beyond praise. In the rendering of landscape art line-engraving cannot go any further than this. The student of the engraved work of Turner has still to take notice of the exquisite prints likewise from some of the most delicate of all Turner's drawings, which recorded his impression of the French rivers—the Seine and the Loire. Furthermore, he has to notice a class of illustration even daintier than these, if also less masculine—the much-prized book-illustrations, of which some contributed to the early editions of Sir Walter Scott's novels are the least known yet not the least noteworthy. But in this class of work the illustrations to Rogers's *Poems* and Rogers's *Italy*, published about forty-five years ago, are confessedly the first; and it is these illustrations, engraved by Goodall, Wallis, Miller, and others, that have made the first editions of the *Poems* and the *Italy* among the earliest acquisitions, nowadays, of the collector of art-books. The large and more lately executed prints after the celebrated pictures—*Mercury and Argus* and *Crossing the Brook*, and the like of these—pretty well exhaust the list of the engraved work with which the visitor does well to occupy himself; and the list is already a long one, ranging from the great free work of the *Liber Studiorum*, so much of which was Turner's own, to the more laborious and mechanical yet not unworthy efforts of the later craftsmen.

FREDERICK WEDMORE.

ART SALES.

ONE of the most important sales that have yet taken place at Messrs. Christie's this season was held very recently, when considerable pictures by modern English masters formed the principal attraction. *A Cornfield on the French Coast*—one of those pictures in which Mr. H. W. B. Davis, A.R.A., has most successfully recorded the characteristics of the Boulonnais—sold for 246*l.*; by W. Linnell, *The Hired Shepherd*, reached 288*l.*; by F. Goodall, *Passing the Cross*, a picture in which the artist had departed from his wonted subjects, and had left the East for Brittany, 262*l.* Mr. Alt's small collection of pictures was sold on the same occasion. *Canterbury Meadows*, a very fair example of T. S. Cooper, sold for 183*l.* *The Mother's First Care*, a popular *tableau de genre*, by T. Faed, sold for 252*l.* There were also considerable examples by W. P. Frith, George Lance, D. MacIise, and other popular artists of the present and of the last generation.

THE Arosa sale, held recently in Paris, consisted for the most part of very interesting slight work by eminent modern artists. The gross sum realised was, therefore, not large—about 4,000*l.*—but the artistic interest of the sale was considerable. A very pretty Corot, *Le Petit Pêcheur*, fell for 200*l.* A still slighter Corot, the *Allée sous Bois*, fell for 76*l.* *A Sleeping Woman*, by Courbet, was knocked down at 120*l.*, which the admirers of that artist held to be extremely cheap. An Eastern picture by Delacroix, *Arabe montant à Cheval*, realised 320*l.* M. Alexandre Dumas, to whom pictures, *bibels* and *bric-à-brac* are known to be dear, became possessed of a pleasant example of Tessaert, *Surah la Baigneuse*, a canvas inspired by the poetry of Victor Hugo. *A Réverie*, by Madrazo, fell for 160*l.*; and a little masterpiece

of Meissonier, *Le Liseur*—a picture formerly in the famous Suermondt collection—reached the sum of 1,080*l.*

NOTES ON ART AND ARCHAEOLOGY.

DR. SCHLIEMANN is now in Paris. He proposes, however, to return to Mycenae and recommence excavations there, as M. Stamatis has been recalled to Athens. As soon as the unsettled state of the country will allow, he intends to resume his explorations at Hissarlik.

THAT the remainder of the celebrated Novar collection of Turner drawings and pictures is to be sold this season—and, indeed, in all probability before Easter—many of our readers are by this time aware; but they will not find unwelcome a seasonable reminder of the nature and extent of this remarkable assemblage of the work of our greatest landscape-painter. Many choice pieces from the collection were sold last year; but they were principally vignettes, and there remain to be sold some twenty or thirty elaborate water-colours of the ripest period of Turner's art. Many were executed, we believe, for the *England and Wales* series of engravings. Their present condition will be a matter of great interest to the amateur; for it is many years since they have been much seen, and that fate should not have befallen them which has befallen too much of Turner's later work in water-colour. These drawings, important as they are, do not exhaust, it may be well to add, the interest of the collection, as it includes six chosen pictures by Turner painted at various periods of his career, and thus representing his art with unusual completeness.

We have received from Messrs. Roos, of Amsterdam, the catalogue of the collections of modern pictures and drawings of the late Mr. P. Langerhuizen, to be sold by them on the 26th and 27th inst. All the best recent Netherlandish and Belgian painters—Gallait, Leys, Rochussen, ten Kate, &c.—and many of the better-known French and German painters, are well represented. Mr. Langerhuizen's important library was recently sold by Frederik Müller.

MR. J. WATSON NICOL is undoubtedly among the most humorous of living painters, and the figures of his pictures are generally so strongly individualised that they approach to what are known as "character parts" upon the stage. In emphasising the individual he verges on the eccentric. The humorous invention known as *When a Man's Single, he Lives at his Ease*—which represents a Jacobean bachelor of comfortable life in the enjoyment of the contentment that succeeds dinner—has been reproduced in etching by M. Lhuillier, and published by Messrs. Deighton and Dunthorne, of 320 High Holborn. The etcher, while preserving what there is of humour in the design, has known how to insist upon what is picturesque; and the etching is thus undoubtedly the work of a very skilled artist. The lines of the composition, which are those of the painter—and the lines especially of the solitary figure—are not, we think, of the happiest; but the lighting of the picture is admirable, at the same time sharp and warm; and the accessories have received from M. Lhuillier, as they are wont to receive from Mr. Nicol, very careful and wise treatment. The eight-legged Jacobean table—by which sits the worthy who is the picture's nominal subject—the wine in the wine-glass, the Venetian decanter, the finely-carved buffet, the brass dish of *repoussé* work, are pleasant details of the furnishing of the chamber of which M. Lhuillier has made the most. The picture was one that demanded for its due translation into black and white the warm effects of light and shade that etching has more easily at command than has line-engraving; and the publishers have done well to entrust the work to M. Lhuillier—an etcher as yet seemingly unspoiled by success; not yet rendered careless by the too-

ready acceptance of his work by a half-informed public.

THE Grosvenor Gallery is open to-day to the public free, after which the present exhibition will be closed.

By a recent decree all the young scholars of the Ecole des Beaux-Arts who obtain the *prix de Rome* are to be exempt from military service, on condition of their passing the regular time at the Ecole de Rome, and fulfilling all their other obligations towards the State.

PAINTERS and sculptors sending works to the French Exhibition will be permitted to add to the names of the works exhibited the names of former works that they may have executed either on or in public monuments. This permission has only just been granted, and in the interest of artists it is wished that it should be made known as widely as possible.

M. OLÉINGER, the French sculptor, has just been commissioned to execute a colossal statue of the Republic, which is to be cast in bronze, and set up at the foot of the Trocadéro, opposite the Pont d'Iéna.

WITH regard to the authorship and subject of the portrait of a Florentine lady, lent by Mr. Willett to the Exhibition of "Old Masters" (see ACADEMY, January 19, February 2 and 9), a discussion was held—too late for us to give an account of its results—at the meeting of the Society of Antiquaries on Thursday evening, March 14. Meantime, Mr. J. O'Connell remarks that, although there can be no doubt about the portrait engraved by Palmerini from Ghirlandajo's fresco being identical with the present work, it is by no means so certain that this portrait represents the same person as the medal inscribed with the name of Giovanna degli Albizzi, wife of Lorenzo Tornabuoni. The note to this effect to which Mr. Willett refers in his letter to the *Times* of January 24, as occurring in Palmerini's catalogue, was not written by Palmerini himself but by Cicognara, underneath the print called *Madonna Laura*, drawn by Ernini, and engraved by Palmerini. It merely says "*Not Laura but Giovanna degli Albizzi*," evidently judging it to be the same person as the medal; but this likeness is disclaimed by Palmerini, who goes through the features of each portrait, pointing out their differences, and also speaks of the paucity of hair on the head in the medal as compared with its abundance in the portrait. The supposition of Mr. Robinson as to the lady represented being Lucrezia Tornabuoni is quite untenable, for that lady was the mother and not the wife of Lorenzo de' Medici as stated by Vasari, and would, therefore, have been an old woman at the time. Neither can it be supposed that Vasari's statement is due only to a slip of memory, by which he substituted the name of Lucrezia Tornabuoni, the mother of Lorenzo de' Medici, for that of Giovanna degli Albizzi, the wife of Lorenzo Tornabuoni; for the passage occurs where he is enumerating the pictures of Botticelli in the possession of the Medici family; and in that possession the portrait of Giovanna would have no cause nor likelihood to be. Prof. Richter's supposition as to the portrait being the work of Ridolfo Ghirlandajo is also set aside by the fact of that painter being a mere child at the date—1488—when it was painted.

THE death is announced of M. Alexandre Viollet-le-Duc, landscape-painter and art-critic, and brother of the more famous Eugène.

In the *Gazette des Beaux-Arts* this month, Cuyp, Paul Potter, Metsu, Jan Steen, and Teniers are the masters criticised by M. Reiset in his eighth article on the National Gallery. M. Ch. Ephrussi contributes a sixth article on Dürer's drawings, enriched by a number of capital illustrations, but including some that we should hardly have ventured to assign to the great German master: for instance, the *Cupid stung by Bees*, a water-colour drawing in the British Museum

copied, according to M. Ephrussi, from one in the Ambras collection at Vienna. M. Duranty, who made some acute remarks on the pictures in the Salon last year, is now going to take us for some "Promenades au Louvre," and first of all in the Egyptian *salles* in order to make a few remarks on Egyptian art. The other writers in the number beside M. B. Fillon, whose article on Molière will be mentioned elsewhere, are M. Alfred Darcel, who occupies himself with Russian art under the guidance of Viollet-le-Duc; M. L. Gonse, who reviews Gustave Eyrie's *Châteaux historiques*; and Le Comte Clément de Ris, who gives an account of the Musée de Puy.

IN the ACADEMY of September 30, 1876, mention was made of the remarkable series of wall-paintings in the Bishop's Palace at Chur, in Switzerland, representing Holbein's celebrated *Dance of Death*, and of the startling hypothesis that Prof. Vogelin had then just brought out concerning them. Since that time the Antiquarian Society of Zürich have published a work by Prof. Vogelin containing reproductions of these interesting old paintings and a fuller statement of his supposition that they were painted by Holbein himself, who executed them, he imagines, on his way back from Italy after his early travels, and only afterwards conceived the idea, probably at the suggestion of some bookseller, of multiplying them by means of wood-engraving. This hypothesis, which, it must be admitted, looks plausible enough at first sight, and is supported by Prof. Vogelin with eighteen different proofs, is not, however, as we before surmised, based on very sound deductions; and in the two last numbers of the *Kunst-Kronik* it is attacked and entirely falls to the ground before the conclusive reasoning of Dr. Alfred Woltmann, the distinguished biographer of Holbein. Dr. Woltmann, when he published the first edition of his work, stated that he had not examined the Chur wall-paintings personally, but since then he has done so, and he now gives a detailed description of them in the *Kunst-Kronik*. According to him, these works were executed "by a clever Swiss painter working under good school traditions." Some of them, he says, have suffered greatly, many have partly perished, yet the cleverness with which they have been enlarged from small copies, especially in the reproduction of costume and landscape backgrounds, in which they often differ from the originals, is unmistakable. That much of Holbein's delicacy is lost is not surprising, but for the most part the painter has happily adapted himself to the Holbein character, only the heads being somewhat heavier than in the woodcuts. When the painter could not carry out Holbein's design, he occasionally adapted a motive from Dürer.

THE *Portfolio* this month gives first an etching from a picture by Mrs. Allingham, entitled *Spring Days*, a portrait of a charming young lady walking in the wood and picking wild flowers; and then, in strong contrast to this pretty modern work, a reproduction of Rembrandt's magnificent etching, the portrait of Ephraim Bonus. The portrait, *Ephraim Bonus*, of which the very rare first state, with the black ring, was exhibited last year at the Burlington Club, was etched by Rembrandt from the painting in the possession of Jan Six—a remarkable fact, for it has been asserted that Rembrandt never etched from his own pictures. This, according to Mr. P. G. Hamerton, is a solitary instance. All lovers of Rembrandt know the fine portrait of the thoughtful Jew doctor, standing for a moment to reflect as he descends the stairs from his patient's sick-room. It is, as a matter of course, admirably reproduced by M. Amand-Durand. The present instalment of the Life of Turner shows the great painter haggling over money transactions with his publishers and engravers, and behaving altogether in a very mean manner, even charging two guineas for the loan of a drawing which the recipient imagined had been freely given him as a present.

THE STAGE.

MR. IRVING'S impersonation of the character of Louis XI., of which we shall have occasion to speak in detail in our general review of the theatres, is likely to be classed among his most successful efforts. The play, as will be remembered by those whose memory of the stage extends backward to the period of the late Mr. Charles Kean's performances, is constructed directly with a view to bring into relief the darker features in the character of the king. Its story is not in itself interesting; nor can its leading personage be said to gain the sympathies of the audience. Mr. Irving's triumph is therefore due mainly to the art of the actor. The key of the performance is distinctly melodramatic; but it is nevertheless highly imaginative; and the successive scenes of the play exercise over the spectator a fascination which is scarcely lessened by the sombre and occasionally even repulsive nature of its incidents. The version, which is neatly written in blank verse, is the work of Mr. Boucicault, and is in fact identical with that in which Mr. Charles Kean was accustomed to appear. The manuscript copy—for the play has never been printed—has been placed at the service of the management by Mrs. Charles Kean.

It is unfortunately impossible to accord much praise to a new drama by Mr. Palgrave Simpson and Mr. Claude Templar, which, under the title of *The Scar on the Wrist*, has been produced at the St. James's Theatre. The title of this piece, in which Miss Ada Cavendish, fresh from Shaksperian triumphs, represents the heroine, does not, it is true, promise anything but a melodrama; but few people with a robust appetite for entertainments of the stage object to a melodrama when it is a good play of its kind. *The Scar on the Wrist* is certainly not a good play of its kind. Its story is composed of very familiar elements, which have not been employed with the skill and tact that might have been expected from the reputation of at least one of the authors. The proceedings of its personages inspire little interest, and the incidents which are introduced with a view to startle or harrow the spectator are sometimes absurd enough to provoke unseasonable laughter.

HERR NEVILLE MORITZ, the Hungarian tragedian, who has recently appeared as Othello at morning performances at the Queen's Theatre, will make his appearance at that house this evening in the character of Shylock in the *Merchant of Venice*.

A NEW comedy, entitled *La Belle Seur*, in three acts and in verse, has been produced at the Troisième Théâtre Français. Its reception has not been very favourable. The author is M. Mary Lafon. *Le Ballon Morel*, at the Théâtre Français, is merely a spectacular play, the heroes of which, like the chief persons in M. Jules Verne's famous piece, travel round the world and see strange and picturesque sights.

MUSIC.

A *Concise History of Music, from the Commencement of the Christian Era to the Present Time*. For the Use of Students. By H. G. Bonavia Hunt, Warden of Trinity College, London, and Lecturer on Musical History in the same College. (Cambridge: Deighton, Bell & Co., 1878.)

THE present work is, as appears from the title-page, one of the series of "Cambridge School and College Text Books." With a vivid recollection of the only other musical work of the same series—Mr. H. C. Banister's book on "Music," which is one of the best and most trustworthy I know—I opened Mr. Hunt's book anticipating that I should find

a worthy companion volume to Mr. Banister's. I regret to say that I have been bitterly disappointed. In his Preface the author says that his book is intended as a text-book; but for a text-book the very first requisite is accuracy; and I am bound in all honesty to say that a book containing in the same space so many gross blunders as the present I never met with in my life. Exclusive of the examination papers and indexes at the end, the book contains 156 small pages; and in these I have marked, as I read, over seventy mistakes, most of them very glaring. It would try the patience of my readers too much to enumerate them all; but to justify the strong language employed with regard to the volume it is needful to quote several.

First let us take a selection from what, but for their number, might perhaps be called printer's errors. On page 13 we read of "*il nuovo musica*"—a curious specimen of Italian. On page 22 Zachau's name is given as "Zackau;" and on page 30 we find "Reüter" for "Reuter." On page 41 Prince Lichnowsky, Beethoven's patron, is called "Liebnowsky." On page 43 Spohr's fourth symphony is called "Die Wiehe der Töne;" while we further find such mis-spellings as "Mercadente" for "Mercadante" (p. 55), "Gaffureus" for "Gafurius" (p. 82), the "Masurga" of Luscinius for "Musurgia" (p. 134—repeated on p. 137), "Novella" for "Novello" (p. 152), and "Wachter" for "Wachtel" (p. 153).

These are, perhaps, bad enough, considering that the work is a text-book; but they are absolutely nothing compared with what is to be found in the matter of wrong dates and incorrect facts. Here, again, I shall only quote as specimens a portion of those I have noted. The dates of the birth and death of Giovanni Gabrieli are given (p. 14) as 1540–1612, instead of 1557–1613. Again, there is perhaps nothing easier to ascertain in musical history than the dates of the composition of Handel's chief works; yet Mr. Hunt gives 1712 instead of 1713 for the *Utrecht Te Deum* (p. 23), 1743 instead of 1741 for *Samson* (p. 24), 1747 instead of 1746 for *Judas Macabaeus* (p. 24); and in his chronological tables (p. 78) he not only repeats the errors as to the *Utrecht Te Deum* and *Samson*, but allots *Saul* and *Israel in Egypt* to 1739, whereas both works were written in 1738. Further, the date of Schubert's Mass in C is given as 1815 instead of 1816 (p. 46); that of the production of Gluck's (Italian) *Alceste* as 1767 instead of 1766 (p. 78); and the death of Hector Berlioz is said (p. 105) to have occurred in 1849, the true date being 1869.

As to facts, a few examples of the kind of blunders to be met with throughout the book will suffice. On page 33 Mozart's six sonatas for piano and violin, dedicated to the Princess of Orange, are described as "six sonatas for various instruments, with harpsichord accompaniment." If Mr. Hunt had taken the trouble to consult Köchel's catalogue he could have found out all about them. On the following page we are told that the same composer wrote twelve masses. The real number (as Köchel could have taught Mr. Hunt) is fifteen, besides some that are incomplete or of doubtful authenticity. On page 43 we read that Spohr produced at the

Philharmonic concerts his symphony in D flat! Spohr never wrote a symphony in D flat at all; and anyone professing to write a history of music ought to know that the symphony produced at the Philharmonic was that in D minor. At page 43 Weber's *Preciosa* is spoken of as an opera, which surely anyone with the slightest acquaintance with the music must be perfectly aware it is not; and on page 47 Schubert's *Rosamunde* is also described as an opera—a title to which it has no more claim than *Preciosa*. But, worst of all, Schumann's music to Goethe's *Faust* is pointed out (p. 119) as one of the "landmarks in the development of opera." By no stretch of language can Schumann's *Faust* be possibly called an opera. Again, in the enumeration, with dates, of Meyerbeer's operas (p. 48) we find the following:—"L'Etoile du Nord (originally in German), 1844." The date of *L'Etoile du Nord* is 1854, not 1844; it was originally in French, the libretto by Scribe; but it contains six numbers from an earlier German opera, *The Camp of Silesia*, which was produced in 1844; and readers will now easily see how Mr. Hunt has managed to confuse matters. On page 56 we are told that one of Balfe's most prominent productions is "*The Castle of Amyon*," a posthumous work." Balfe never wrote a work with any such title at all; the posthumous work referred to is probably the *Talisman*. On page 58 we read of "F. H. Cowen, composer of the *Rose Maiden*, the *Corsair*, and other operas." Neither the *Rose Maiden* nor the *Corsair* is an opera. On the same page we learn that Spohr set Goethe's *Faust* to music. This is certainly news to us; the libretto of Spohr's opera is not founded on Goethe's poem at all. In the "Art Summary," among writers of sonatas for the piano we find the names of Weigl and Kreutzer. Mr. Hunt may be challenged to find one single sonata for the piano by either of those composers. On page 147 we learn that the basset-horn "might be considered obsolete, but for its recent employment by Wagner." Wagner has never employed it in a single one of his scores. On the following page another startling fact is communicated in the following words:—"The presence of the trombone in many of Handel's scores is due to Mozart, who greatly improved the chorus accompaniments in this respect." The only score of Handel's into which Mozart introduced trombones was the *Messiah*, and even there they are not used except in the introduction to the overture, and in the accompaniment of the short quartetts, "Since by man came death," and "For as in Adam all die." In not one single chorus in any one of Handel's works did Mozart ever add trombones at all.

I have marked at least twenty or thirty more blunders quite as outrageous as those I have quoted, but forbear to tire the reader's patience by enumerating them. The book appears to be a mere compilation from all kinds of sources; and the editor almost seems to have taken everything he read for gospel. It is but seldom he ventures on any original remarks; when he does, the result is (to say the least of it) surprising. Two quotations will suffice in support of this statement. Here is one:—"In the domain of chamber music, Schubert's most striking composition

is, perhaps, the octet for stringed and wind instruments" (p. 47). The inference is irresistible that the writer knows neither the two piano trios, the quartetts in D minor and G, nor the great quintett in C. The other opinion to be quoted is still more extraordinary:—

"In the great majority of his works, whether in his symphonies or in his organ sonatas, Mendelssohn disregards the requirements of the set forms of composition, and for that reason is scarcely to be regarded as a safe model for the young composer" (p. 51.)

One would have thought that every musician knew that if ever, since the foundation of the world, there lived a composer whose works were perfect models of correctness, purity, and elegance of form, that composer was Mendelssohn. This is admitted even by those who deny his claim to a place in the first rank of tone-poets. So absurd a statement as the above has seldom been made in print.

It would be superfluous, in conclusion, to pass any opinion as to the general value of Mr. Hunt's book. The extracts quoted will sufficiently speak for themselves.

EBENEZER PROUT.

THE programme of last Saturday's concert at the Crystal Palace included Beethoven's symphony in A (No. 7), splendidly played by the band; Sullivan's clever overture to *The Sapphire Necklace*, which has been more than once before heard at the Palace, and the ballet music from Verdi's *Don Carlos*, as the orchestral numbers. Mdlle. Marie Krebs gave a fine performance of Chopin's concerto in F minor, and Mdlle. Sophie Löwe and Signor Foli were the vocalists. This afternoon Prof. Macfarren's *Lady of the Lake* will be performed, an opportunity being thus given for the first time to Londoners of making acquaintance with the work.

At the Adelphi Theatre, on Tuesday evening, Mdlle. Marie Fechter made her first appearance in England as Marguerite in Gounod's *Faust*. The ordeal was a severe one, because Mr. Rosa has accustomed us to no ordinary degree of excellence; but it is no more than justice to the young lady to say that she passed through it triumphantly. Of her voice it would be rash to speak positively after one hearing; the impression produced by one performance (an impression to be taken with some reserve) is that it is of no great power, but well trained, and of very sympathetic quality. Mdlle. Fechter's great success, however, was made by her acting: a more charming impersonation of the heroine of Gounod's opera can scarcely be imagined. As Faust, Mr. Joseph Maas more than confirmed the good opinion expressed after hearing him in the *Golden Cross*; while the parts of Mephistopheles, Valentine, Wagner, Siebel, and Martha, were without exception excellently given by Messrs. Celli, Ludwig, and Dodd, Miss Josephine Yorke and Mrs. Aynaley Cook. The ensemble of the work was worthy of Mr. Rosa, and no higher praise could be given to it.

THE first of three quartett concerts was given by Mr. Carrodus and Mr. Edward Howell at the Langham Hall yesterday week, the 8th inst. Mozart's quartett in G (No. 1), the posthumous Andante and Scherzo from Mendelssohn's Op. 81, and Beethoven's quartett in C minor, Op. 18, No. 4, were given by an excellent quartett party, consisting of Messrs. Carrodus, V. Nicholson, Doyle, and E. Howell. The programme also included Molique's Three Melodies (Op. 36) for violin and pianoforte, played by Messrs. Carrodus and Henry Thomas, and two songs given by Miss Julia Elton.

MDLLE. MARIE KREBS gave the first of two pianoforte recitals at St. James's Hall on Wednesday afternoon; with a very interesting programme

including Bach's Prelude and Fugue in C major, Rameau's Gavotte with variations, Beethoven's "Waldstein" Sonata, Bennett's "Lake, Millstream, and Fountain," and smaller pieces by Chopin, Rubinstein, Krebs, Tchaikowsky, Schloezer, and Liszt. The second recital is announced to take place on Wednesday week, the 27th inst.

THE result of the competitions for the prizes offered by the Société des Compositeurs de Musique last year has just been announced. The prize of 200 francs for a five-voice madrigal is awarded to M. Henry Cohen; that of 300 francs for a fantasia and fugue for the organ to M. Emile Bernard; and that of 500 francs for a sonata for two pianos to M. Georges Pfeiffer; while a second prize of the same amount for a string quintet has not been awarded at all; two competitors received honourable mention, but neither was thought worthy of the prize.

ERRATUM.—In last week's ACADEMY, p. 224, col. 1, for "Hünter" read "Hünter."

LITERATURE.

The Sonnets of Michael Angelo Buonarroti and Tommaso Campanella, now for the first time Translated into Rhymed English. By John Addington Symonds. (London: Smith, Elder & Co., 1878.)

FIFTEEN years ago the poems of Michelangelo were printed for the first time in their integrity. Their editor of 1623, the great painter's grand-nephew, had a regard for his uncle's fame, and he amiably rewrote his verses for him, smoothing what was rugged, correcting what was obscure, taming to bland propriety what was violent, rendering safe and innocuous whatever might seem to threaten danger. From the true text, edited by Signor Guasti, the translation of Mr. Symonds is made. The sonnets of Campanella—a selection from poems written by the afflicted philosopher in his Neapolitan dungeon—appeared almost at the same moment as the poems edited by the younger Michelangelo. An admirer and disciple of Campanella—Tobia Adami—put forth in Germany in 1622 a little volume of his master's verses, accompanying them with a prose commentary. So rare had this quarto become that it was only after a search of twenty-five years that Orelli procured a copy, from which he printed his own edition of 1834.

We already enjoyed a foretaste of the contents of the present volume in the article on Michelangelo's sonnets contributed by Mr. Symonds to the *Contemporary Review*, and that on Campanella's poems contributed more recently to the *Cornhill Magazine*. The translator has made a real, a definite, and, I think, an enduring addition to the spiritual wealth of English readers. The workmanship of these English sonnets is excellent, firm and clear, without being mannered or over-curious; only in some instances Mr. Symonds might have cared more to enrich his rhymes, and have avoided the facile consonance of terminations. His conception of a translator's duty is that an English translator should write in English, and that verse is selected for some other purpose than that of causing refined torture. He therefore does not, in a vain effort to achieve something impossible, wring and rend the English language until it writhes and screams like a tree in tempest. A poetical athlete or gymnast breathless after a foiled *tour de force* is a striking spectacle; Mr. Symonds does not present that spectacle; he has preferred to aim at something which he can achieve, and to achieve it.

Points of contrast between the genius

and work of Michelangelo and the genius and work of Campanella are more numerous and striking than the points of resemblance. A common antagonism to the degenerate spirit of Italian literature, says Mr. Symonds, is "the link which binds Michael Angelo, the veteran giant of the Renaissance, to Campanella, the audacious Titan of the modern age." The essential difference between the intellectual positions of the two may be expressed by saying that the one was a spiritualist, the other a naturalist. To Michelangelo nature seemed to lie below man, and above man stood God; man is the rival, the conqueror, the lord of nature; all the glory of creation is summed up in man; but human beauty and human love are ennobling because they are beams from the divine source of light, from God Himself. To Campanella man is a worm, a louse on the body of that great sentient being, Earth; the Earth itself is but an inhabitant in the body of the Universe; and throughout the Universe lives God, the universal mind. With Michelangelo the highest law of his being is concentration; a pouring of his whole self into the most select efforts and aspirations of ideal manhood. Whatever influence could evoke from the rude mass of his character some new line of heroic beauty became precious to him; he would submit himself to such an influence with more than fortitude, with ardour; he would go forward with the energy of a large, passionate nature to meet the divine beam of beauty, the divine beam of love; he would assist in making deep their sacred stigmata. But for him the divine narrowed itself to a beam, a ray. To Campanella it was a wide-diffused Presence; and the highest law of his being was expansion, not concentration. From his prison at Naples he stretched forth spiritual arms to embrace the universe. One of the mystics of the new philosophy of Nature, hardly less one of its martyrs than Bruno or Vanini, he was sustained during his long years of trial by faith and irrepressible hope. For the world, Michelangelo, the prophet, announced from his solitude in the Sistine Chapel a judgment: Christ who had hung upon the cross was to reappear as a strong justiciary, in order that at last, in another state of being than this, and by supernatural means, the will of God might prevail over the evil and over the good. Campanella saw Christ present in earth, now and here; and Christ's new name is Freedom; kings and priests are banded together against him; hypocrisy, tyranny, sophistry, the offspring of ignorance, toil together to enslave the conscience, the intelligence, and the energies of man; but God and Christ are in the world, powers of beneficent revolution, the inspirers of new philosophy; and by union with God in Nature, and in the study of Nature, shall not we ourselves assist in the resurrection to life of the whole world?

And therefore it is a small thing to suffer for a little while, for a day, for a year, for a score of years. Campanella watched the planets as they moved past his prison bars, and he could divine that the new millennium was at hand. From the bell (*campanella*) of his brain he rang out its tocsin to the world. Was the year 1603 to be the year of grace? It passed, and the dungeon for

a time seemed darker than before. But he was again caught up into the wind and light of his hope. He calls upon the peoples and the cities—to Genoa, to Venice, to Poland, to the Swiss—to forsake their shames and slaveries, to rejoice in true liberty and magnanimity. Could he but be assured that his own death would bring advantage to the race of men, the pain of death were light! Philip has plunged him in a worse prison—the Omnipotent keeps silence; and yet Philip can do but as God allows, and God does no ill. Very heroically Campanella writes upon the sufferings of Jesus: he who had seven times endured the torture could well imagine the anguish of the cross; yet to him that anguish seemed worthy to be accounted as nothing in comparison with the joy that was set before the sufferer. Why should painters depict a sorrowing instead of a rejoicing Christ?—

"If Christ was only six hours crucified
After few years of toil and misery,
Which for mankind He suffered willingly,
While heaven was won for ever when He died—
Why should He still be shown on every side,
Painted and preached, in nought but agony,
Whose pains were light matched with His victory,
When the world's power to harm Him was defied?
Why rather speak and write not of the realm
He rules in heaven, and soon will bring below
Unto the praise and glory of His name?
Ah, foolish crowd! This world's thick vapours whelm
Your eyes unworthy of that glorious show,
Blind to His splendour, bent upon His shame."

And now Christ who had been again crucified in the world, and that by his own friends, the Christian Scribes and Pharisees, is again to show himself triumphant. While Campanella held that science and democracy were to preside over renovated Europe, he had no sympathy with the Protestant Reformation, nor with the consolidating nationalities of the North.

"Il s'aperçoit," wrote Quinet in his chapter on Italian Philosophy, "que le midi catholique au déclin a pour héritier le génie du nord et le protestantisme. Pour arrêter cette pente des choses Campanella veut armer le catholicisme de toutes les forces de la liberté démocratique, et le précipiter contre les États nouveaux."

It is unfortunate, though perhaps inevitable, that such a phrase as "*Platonic conceits*" should be applied to the imagery of Michelangelo's poems, for, although the influence of certain literary traditions and of a moment in the history of Italian culture is apparent in the poems, we lose their unique virtue if we regard them as examples of a school or of a style. They are primarily utterances, real and direct, of the strength and sweetness of the soul of a solitary man; there is not an image in any one of them which is not created out of the desire of his heart to interpret to itself its joy, its sorrow, its unrest, its deep repose. The nature of Michelangelo was not one which easily became harmonious; it needed by stern inward discipline or by some high grace from above to be harmonised. Such a man must become the slave of sensible things, if he may not become their master. If he cannot be the Demiurge of a world of ideal beauty, and rule over his new creation, the world of visible beauty will overmaster him and tyrannise him. He has been

"from childhood given
A prey for burning beauty to devour."

But how if beauty come as an emissary from God, and love be, not a fire setting ablaze the "flesh of tow," but a live coal from the altar of heaven? The Platonism in which Ficino and the Academy had instructed Florence, connecting itself with the grace conferred upon him by one or two beloved persons, solved for Michelangelo an urgent, real, and personal problem. The struggle with rebellious matter was appeased; it had been a combat à outrance; the strain and stress were now allayed: he had grown old toiling against a heavy sea; now the motion onward became so blissfully serene and swift that it almost seemed repose: he had been solitary and proud; now the sense of solitude was removed, and with the absoluteness of a strong-willed man he bent to the perfect humility of love: he had been striving to shape himself by devotion to heroic ends; now another sculptor had come to call forth from his stuff of manhood the ideal man that lay hidden within, and his part was only to co-operate by a resolved submission. And when his fiery energy reasserts itself, it is purified, and tends upward with desire the very pain of which is only untransformed rapture. Joy and peace have met together; behind the "sweet untroubled eyes" of the Beloved beams "the pure light of heaven;" love "leaves the heart all soft and infantine" for the rays of God's grace to enter:—

"As one who will reseek her home of light,
Thy form immortal to this prison-house
Descended, like an angel piteous,
To heal all hearts and make the whole world bright.

'Tis this that thralls my soul in love's delight,
Not thy clear face of beauty glorious;
For he who harbours virtue, still will choose
To love what neither years nor death can blight.
So fares it ever with things high and rare
Wrought in the sweat of nature; heaven above
Showers on their birth the blessings of her prime:

Nor hath God deigned to show Himself elsewhere
More clearly than in human forms sublime;
Which since they image Him, alone I love."

Youth had passed and middle-age before Michelangelo made discovery of the highest grace, conferred by one human soul upon another, which it was given him to receive. A renovating spring comes to him at the end of harvest; he fears that an old man can hardly endure so keen a joy; he knows how brief must be an old man's bliss; he dreams of a possible might-have-been:—

"Had I but earlier known that from the eyes
Of that bright soul that fires me like the sun,
I might have drawn new strength my race to run."

Yet all is well; or at least why complain?

"For even now I find
In that glad angel's face, so full of rest,
Health and content, heart's ease and peace of mind.

Perchance I might have been less simply blest
Finding her sooner; if 'tis age alone
That lets me soar with her to seek God's throne."

And then came the death of Vittoria, which, as Condivi relates, almost made Michelangelo lose his senses. Years afterwards he said "that he repented nothing so much as having only kissed her hand, and not her forehead and cheeks also when he went to her at the last hour." We read in the sonnets how her loss was to him as the loss of the unique artificer of his soul.

One refuge remained—the Cross of Christ, and in the sonnets we are allowed to enter into the solemn presence of the greatest spirit of the Italian Renaissance in its hour of prostration at the feet of the divine Sufferer. Into that presence one would enter silently and not amid a company.

EDWARD DOWDEN.

Histoire d'un Crime. Par Victor Hugo. 2^e Partie. (Paris: Calmann Lévy, 1878.)

THE second part of the *Histoire d'un Crime*, which had been promised for December 2, has since then been awaited with great impatience, not wholly unmixed with fear. It was asked whether this delay did not proceed from the fact that the author still had much to add to his book, and whether this second part, instead of being, like the first, the testimony of an eye-witness, written immediately after the events, might not be a literary composition, less accurate and more ornate, made up of recollections selected and arranged. This fear has not been justified. The second volume, like the first, is composed of a series of minute facts, seen or known immediately by the author himself, related with the utmost precision, without declamation, without violence, with a restrained emotion which gives the book an extraordinary power. The first volume brought us down to the night of December 3-4. The second sets before us the daytime of the 4th ("The Massacre"); the night of December 4-5, and the day-time of the 5th ("The Victory"); as well as the various circumstances of the flight of the chiefs of the insurrection who succeeded in making their escape. Lastly, the conclusion ("The Fall") is a brief account of the Battle of Sedan represented as the chastisement of the crime and the moral of this history of December 2. This last portion, except the first three pages, in which Victor Hugo describes in a vein of exquisite poetry his arrival at Sedan in September, 1871, is feeble and declamatory. It is very short, however, and is in strong contrast with the rest of the volume, which will take rank among the finest works of Victor Hugo.

Without wishing to guarantee the rigorous exactitude of every minute fact related by the author, we may confidently state that as a whole the story is strictly true. It shows admirably the trifling character of the resistance, and the inertia and impotence in the midst of which those heroic men fought who, in presence of that great crime, fulfilled their duty to the end. At the same time it enables us perfectly to understand how, deceived by their own heroism and by their faith in the justice of their cause, they could have believed in ultimate success for a brief instant on the morning of the 4th. Even now Victor Hugo seems to believe that they would really have triumphed, had it not been for the massacre of the Boulevard. But his own account shows that this is an illusion; the mass of the people could not and would not fight.

The book before us cannot be analysed, for it consists of a series of details from which the reader gathers a general impression

which is at once very forcible and very clear. Victor Hugo excels in these swift and tragic narratives, in which real life assumes the proportions of an epic. The finest passage in this volume is certainly the account of the taking of the barricade of the Rue du Petit Carreau, and of the death of Denis Dussoubs. He was the brother of a representative of the Left, who was ill and was sorely distressed at his inability to join the combatants. His brother Denis took the representative's scarf, mixed with the insurgents, and in the night of the 4th-5th passed himself off for his brother by a falsehood not far removed from the sublime, and harangued the soldiers, adjuring them as a representative to place their arms at the service of justice and of the law. For sole answer he was shot point-blank. It was believed to be Gaston Dussoubs who had been slain, and thus Denis saved his brother's life by sacrificing his own. On his body was found a letter addressed to a girl whom he loved, the text of which is given us by Victor Hugo. Nothing can be more touching after the tragic story than this page of idyllic tenderness in which, four days before laying down his life, Dussoubs wrote:—
"Je n'aime pas les grandes villes et leur bruit, villes peuplées d'étrangers, où personne ne vous connaît et où vous ne connaissez personne, où chacun se heurte et se coudoie sans échanger jamais un sourire. Mais j'aime nos campagnes tranquilles, la paix du foyer, et la voix des amis qui nous caresse."

The comparison of the *Histoire d'un Crime* with the *Châtiments* will furnish future critics with interesting materials. It will be seen how every line of this poem, the most powerful, the most inspired that Victor Hugo ever wrote, rests on a real fact, on a personal experience, on a precise recollection. One of the finest pieces of the *Châtiments* is that entitled "Souvenir de la Nuit du 4:—"

"L'enfant avait reçu deux balles dans la tête," &c., which describes the lamentations of a poor old grandmother over the corpse of a little boy of seven, killed in Rue Tiquetonne. The scene which inspired Victor Hugo with those noble lines he witnessed with his own eyes, and he describes it in the second volume of the *Histoire d'un Crime*. The prose story is perhaps superior to the poem. It deserves to be quoted; for it is a masterpiece of narration:—

"E. P. [one of Victor Hugo's companions] s'arrêta devant une maison haute et noire. Il poussa une porte d'allée qui n'était pas fermée, puis une autre porte, et nous entrâmes dans une salle basse, toute paisible, éclairée d'une lampe. Cette chambre semblait appartenir à une boutique. Au fond on entrevoyait deux lits côte à côte, un grand et un petit. Il y avait au-dessus du petit lit un portrait de femme, et, au-dessus du portrait, un rameau de buis bénit. La lampe était posée sur une cheminée où brûlait un petit feu. Près de la lampe, sur une chaise, il y avait une vieille femme, penchée, courbée, pliée en deux, comme cassée, sur une chose qui était dans l'ombre et qu'elle avait dans les bras, c'était un enfant mort.—La pauvre femme sanglotait silencieusement.—E. P., qui était de la maison, lui toucha l'épaule et dit: 'Laissez voir.'—La vieille femme leva la tête, et je vis sur ses genoux un petit garçon, pâle, à demi déshabillé, joli, avec deux trous rouges au front. La vieille femme me regarda, mais évidemment elle ne me voyait pas; elle murmura, se parlant à

elle-même: 'Et dire qu'il m'appelait bonne maman ce matin!' E. P. prit la main de l'enfant; cette main retomba.—'Sept ans,' me dit-il. . . Il m'expliqua qu'il y avait un médecin dans la maison, que ce médecin était descendu, et avait dit: 'Rien à faire.' L'enfant avait été frappé de deux balles à la tête en traversant la rue 'pour se sauver.' On l'avait rapporté à sa grand-mère, 'qui n'avait que lui.' Le portrait de la mère morte était au-dessus du petit lit. L'enfant avait les yeux à demi ouverts, et cette inexprimable regard des morts où la perception du réel est remplacée par la vision de l'infini. L'aïeule, à travers ses sanglots, parlait par instants: 'Si c'est Dieu possible!—A-t-on idée! Des brigands, quoi!' Elle s'écria: 'C'est donc ça le gouvernement!'—'Oui,' lui dis-je.—Nous achevâmes à déshabiller l'enfant. Il avait une toupie dans sa poche. Sa tête allait et venait d'une épaule à l'autre, je la soutins et je le baisai au front. Versigny et Bancal lui ôtèrent ses bas. La grand-mère eut tout à coup un mouvement. 'Ne lui faites pas de mal,' dit-elle. Elle prit les deux pieds glacés et blancs dans ses vieilles mains, tâchant de les réchauffer. Quand le pauvre petit corps fut nu, on songea à l'ensevelir. On tira de l'armoire un drap. Alors, l'aïeule éclata en pleurs terribles. Elle cria: 'Je veux qu'on me le rende.' Elle se redressa et nous regarda et se mit à dire des choses farouches, où Bonaparte était mêlé, et Dieu, et son petit, et l'école où il allait, et sa fille qu'elle avait perdue, et nous adressant à nous mêmes des reproches, livide, hagarde, ayant comme un songe dans les yeux, et plus fantôme que l'enfant mort. Puis elle reprit sa tête dans ses mains, posa ses bras croisés sur son enfant, et se remit à sangloter."

One of the most curious chapters in the *Histoire d'un Crime* is the account of a conversation between Victor Hugo and Prince Napoleon on November 16, 1851, in which the latter recommended Victor Hugo to have the President of the Republic arrested, warning him that unless so prevented the President was on the point of executing the *coup d'état*. Victor Hugo rejected the Prince's advice, and defends himself incidentally from the foolish accusations brought against him by those who asserted that he had asked Louis Napoleon for a portfolio. Victor Hugo's best justification is his conduct on December 2. A man risks his life for the cause in which he believes; not to avenge his wounded vanity. Victor Hugo was a hero during those dark days. He had a right to bequeath to posterity a detailed account of his heroism, and at the same time a damning testimony concerning one of the greatest crimes of history.

Has he not made the picture yet darker, and added to the culpability, already so great, of the chief criminal, Louis Napoleon? Was the massacre of the Boulevard which took place in the afternoon of the 4th a premeditated act accomplished in cold blood in accordance with precise orders, to terrify Paris and France; and not one of those spontaneous acts of sanguinary frenzy such as are apt to happen in civil wars—like, for instance, the massacre of the Rue Transnonain in 1837? Victor Hugo asserts the former without giving positive proofs; but it is certain that there are many probabilities to be alleged in support of his opinion: the absence of any barricade on the Boulevards, the fact that some were massacred even in their own houses, the purposeless cannonade directed against the Maison Salandrouze. Nevertheless, although it is well known that Louis Napoleon was in-

different to the distinction between good and evil, it is also known that he was not a monster, that he was not constitutionally cruel; and one can scarcely admit such an act of savagery as coming directly from himself. Of Morny or of Saint-Arnaud one would admit it with less difficulty. There are still living witnesses enough of these events to render it possible, by an impartially conducted enquiry, to arrive at the truth. If the French Government can scarcely undertake it, it would be a task which might tempt a clear-headed and patient historian like Maxime Du Camp. It should be done quickly, for when once public opinion has adopted Victor Hugo's version, true or false it will pass for certain. Genius is believed on its word. Many may seek in the psychological analysis of the character of Napoleon III. valid excuses for his conduct, may prove that before December 2 France was rushing to anarchy and ruin, and that it is the empire which has rendered a reasonable Republic possible; for the great mass of posterity Napoleon the Third and the Empire will remain fast in the pillory to which they have been inexorably condemned by the *Châtiments* and the *Histoire d'un Crime*. G. MONOD.

More Glimpses of the World Unseen. By the Rev. F. G. Lee, D.C.L. (London: Chatto & Windus, 1878.)

THE Rev. F. G. Lee has published a new volume of ghost stories. He is not to be daunted, he says, by sceptical and anonymous writers who talk of his "grovelling superstition" and "debasing gullibility." This sort of language cannot be too severely blamed. On the other hand, Dr. Lee's critics are not more anonymous than the witnesses who testify to his ghosts. He remarks (p. 146) that "the ordinary laws of evidence—possibly old-fashioned and unsatisfactory nowadays—would certainly substantiate several of the more remarkable narratives" in his volume. If they would, it is a pity that their aid has not been called in by Dr. Lee. He probably knows what is the value of tales which the laws of evidence would confessedly not substantiate, and it is not easy to see why he should publish such stories. We shall now look at his facts and his evidence, though the task is rather dry and tedious.

Dr. Lee objects to anonymous criticism. He has no objection to anonymous witnesses. His first story (p. 11) is authenticated by Bishop Hall. The prelate examined a man who was cured of lameness by bathing—after advice thrice communicated in a dream—in a well in Cornwall. One requires to know all about the well. Had its waters any peculiar virtue, or supposed sanctity, or traditional sacredness, derived from a far-off age of well-worship? Dr. Lee does not satisfy our curiosity. The Indian conjuror's trick of the mango-tree (p. 12) is incorrectly reported if our own informants are to be trusted. The "visible growth" of the tree is precisely what the spectators do not see. The mystery, too, is a mechanical one, and has been explained, in its earlier stages, to a friend of the writer of this notice. Colonel Churchill (p. 13) does not say he witnessed the ma-

gical feats of Sheik Bechir. They rest, as far as we can make out, on popular rumour. The dancing ring of the Juggler (p. 15) was published in the *Times*, but the "necromantic" explanation of the trick is mere crude hypothesis. The basket-trick (p. 17) is reported of in a much less marvellous style by cautious Anglo-Indians. The anecdote of a Catholic priest, who stopped the fun by muttering a prayer (p. 18, foot-note), relies on the authority of "it is reported." Bishop Hall gives a long story of *démonialité* (p. 20) on the authority of "Bodin, Reney, Gaulatus, Zuingerus." Dr. Lee has not, it seems, consulted these originals. Now it is necessary to track all such myths. We have found the Beresford ghost (reported in Dr. Lee's former volume), in Henry More, in a series of mediæval sermons, and in William of Malmesbury, not without modifications, indeed, but still fundamentally the same story. A tale of a haunted house (p. 30), which recalls the Drummer of Tedworth, is offered on the testimony of an unsigned MS. in a handwriting of the seventeenth century. Miracles connected with Lourdes are related (pp. 35-40). In three cases of cure out of six, various agencies are said to have been employed, such as nine days' prayers, three hundred masses, applications of clay, and so forth. We are not here discussing the efficacy of prayer, or the power of imagination over disease, a subject which has a hundred times been curiously illustrated. The evidence, in three or four cases, is of the vaguest, if it can be called evidence at all. As to Louise Lateau, it is impossible to master all the literature of that case, and party-feeling on both sides obscures the truth. The story of Donne's wife, as told by Walton, is interesting, and goes, with many other stories, to show that living people may be impressed with a belief that they are in the presence of distant friends. Herr Delitzsch, and the anecdote on page 139, and the unauthenticated reports (pp. 134 and 138) are of the same kind. They do not quite prove anything about angels. After some trivial anecdotes about fulfilled dreams—as if out of many millions of dreams a few could escape fulfilment—we have Lady Fanshawe's Banshee; good, but stale.

A long legend of a vision comes, in a roundabout way, from "a lady at Thame," now dead, who had it from local tradition, or rather, from "a French nobleman well known to the Editor's grandfather." A tale of a dream used by Bret Hart in *Gabriel Conroy* is given without authentication (p. 69). Of a long story of a vision of undertakers, we are told (p. 77) that it "was read over to the lady who furnished it." We are not told, though perhaps we are expected to understand, that the lady who "furnished" the story was one of the two people who saw the ghostly undertakers. The anecdote is related in the first person. The next story (p. 78) describes a dream which was fulfilled, indeed, but in a very inaccurate and casual way. St. Gregory's anecdotes are offered on the authority, of course, of St. Gregory, who had them from various people. A long story comes from an unsigned pamphlet (p. 94), with no publisher's or printer's name. "A mutual friend, or a con-

nexion of the family," supplies a tale in p. 103.

"The Gyb Ghosts" (p. 109) would have delighted Edgar Poe; they *may* be authenticated, but Dr. Lee gives his authority in a lax unbusiness-like fashion. Then we have some haunted houses, "at first hand;" they are good, but lead to nothing. The ghosts, if we understand Dr. Lee, were seen by Mrs. Ravenshaw, who communicated the story. This is almost the first piece of evidence for anything better than a wraith that we have been favoured with. A ghost who borrowed money is told of on mere roundabout hearsay (p. 116). The initials M. C. B. are responsible for a tale of a spectral old lady. The Rev. Arthur Bellamy, B.A., Vicar of Puklow, Bristol, saw the ghost of a lady who had promised to appear to Mrs. Bellamy. This ghost is, on the whole, the most straightforward spectre in the collection. Another (p. 130) was testified to in an American criminal case. Needless to say that Dr. Lee has not produced a report of the trial. An anonymous Reviewer in the *Church Quarterly* saw a wraith (p. 133), and we have already alluded to one or two other wraiths, a sort of spectre for which there is most evidence, but which proves nothing, one way or another.

Dr. Lee's modern tales of angels are beautiful; we should be glad to believe them, but the evidence is hopelessly inadequate. As to his chapter on "modern necromancy," one can show him an example of detected imposture to match every one of his samples of imposture which was not detected. He quotes much of the blasphemous rant of the mediums, but their theology is not worth discussing. It remains to ask, what amount of testimony for what is called the "supernatural" do Dr. Lee's stories supply? He has appealed to "the ordinary rules of evidence," and by them he is condemned. Nevertheless, one may go on believing in ghosts, in spite of Dr. Lee. A. LANG.

Venise. Par Ch. Yriarte. (Paris: J. Rothschild, 1877.)

M. YRIARTE has just published the concluding portion of an illustrated work, the first volume of which was favourably reviewed in the ACADEMY about a twelvemonth since. The new part is entitled *Venise: Histoire, Art, Industrie, la Ville, la Vie*; and the whole is dedicated as a tribute of gratitude to Sir Richard Wallace. M. Ch. Yriarte is Sir Richard's secretary in Paris, and has charge of his collections there; he sends him notice of the works of art or special curiosities that are offered for sale, and of the important auctions, and keeps him generally *au courant* of all the questions in which art is in any way connected with politics. Charles Yriarte is an extremely active man. He made his *début* in the artistic world as an illustrator, and very soon after succeeded in getting the artistic management of the *Monde illustré*, a weekly paper. A lively and popular writer, he is the author of several volumes of tales and of some notes on the Clubs which have attracted some attention, and which, under a discreet disguise, contain some curious portraits of men and women in high life. An indefatigable tourist, he has traversed Spain

—whence, I believe, his family originally came—in every direction; also Italy, the Danubian provinces, &c. From Spain he brought back a big volume of notes on Goya, which was published by Messrs. Plon, and which contained a number of unpublished reproductions of the frescoes and pictures of the Spanish master, who is much more appreciated and admired here than in England. From the Danubian provinces and the shores of the Adriatic he brought back notes and sketches that have appeared in the *Tour du Monde*, and which form part of Hachette's yearly volume for 1877. From North Italy, which he several times visited, he brought back the volume that came out last year, containing the historical part, and the volume before me now.

In the first chapter, headed "La Peinture," the rise of the Venetian school, its great representatives and the artists of its decadence are set before us necessarily very briefly, but very clearly. M. Yriarte does not pretend to the learning that decipherers parchments in the archives. He is more fleet of foot; but in going from town to village, from convent to church, he buys, reads, questions, and verifies, in the light of the originals, all that is published in the way of guides, pamphlets, books, magazine articles and criticisms on the masterpieces of Italian art, and on the masters who created them. I have only one complaint to make as regards this part of his book—and that is, that he did not insist on the illustrations being better done. His publisher is in the habit of publishing scientific or administrative works. He is certainly ignorant of our present resources in the way of draughtsmen, engravers, and *procédés*.

The second chapter, "Le Mouvement Littéraire; la Typographie," is full of interest. In a great number of cases, to reproduce pages of rare or typical books, ornamental letters or headings of chapters, those photographic *procédés*, as we call them, have been made use of which produce negatives of the utmost exactitude. Notably the firm of Yves and Barret have of late succeeded in supplying *L'Art* and the *Gazette des Beaux-Arts* with negatives as clear as woodcuts in appearance, and mathematically far more exact. These material advantages are very great, as a considerable economy is the result. The moral advantages are no less important, as it is impossible for the public to doubt the truth of what is put before them, and they are therefore able to form a clear idea of the defects as well as of the merits of the old styles. M. Yriarte derived most of his examples from the collection of the late M. Firmin-Didot, which has been in part dispersed, and from that of M. Eugène Piot, an amateur of very refined taste. Among the pages thus reproduced I may mention:—"Le Triomphe de Vertumne et de Pomone," from the *Songes de Poliphile* (1499); a portrait of Aldus Manutius, and one of Pietro Aretino from a woodcut of Titian's; a portrait of Cassandra Fedele (1497), a learned lady who spoke before the Emperor Frederic III. on the occasion of his passing through Venice, and spoke like an orator by profession; the facsimile of a page of the *Herodotus* printed in Venice in 1494 by Joan and Gregorio de Gregoriis.

These are followed by a printer's mark, in the most exquisite taste, from the *Ennéades* of Sabellico (1498), and some specimens of Venetian binding borrowed from the library of Firmin-Didot.

The chapter headed "Le Verre et la Mosaïque" is an admirable summing-up of our present knowledge of these materials. "La Dentelle et le Costume" addresses itself more especially to readers of the fair sex. I do not know whether the same fashion prevails in England as in France; but in France our great ladies have taken to works of embroidery in wool, silk, or thread. To be worth anything, however, these embroideries must be done, not from patterns drawn at the shops or published in a fashion-book, but from old needlework. The *Princesse de Beauveau* is especially famous for her imagination and her knowledge of the various styles of old needlework. She has pupils; and it would seem quite natural that such a delicate art, for which Albert Dürer and Titian did not disdain to draw designs, should owe its revival to the skill of a knot of intelligent women of her class. In any case the specimens which M. Yriarte gives of *point coupé*, *point à l'aiguille*, &c., cannot but help in promoting this revival. Your South Kensington and several of your great Manchester manufacturers are so rich in original fragments of needlework that I need hardly dwell more at length on the subject.

For his "Essai de Catalogue des Médailles vénitiennes" M. Yriarte has had recourse to the collections of MM. Hys de la Salle, Dreyfus, and Armand, as well as to the cases of the Cabinet des Médailles. The idea is a good one, as it introduces the world at large to a series of curiosities which they often hear talked of by collectors. Unfortunately the reproduction of these bronzes, which are so simple and vigorous, was entrusted to draughtsmen and engravers who did not understand either their beauty or their charm. In a second edition these caricatures must be replaced by something better. The remark has been made that, for the most part, the famous medallists of the Renaissance who were born in Venice or within her territories were little employed by the Most Serene Republic. It is certain that with the exception of the effigies of the Doges, which were regarded by the Government as a sort of binding obligation, Venice was not given to perpetuating the glory of her heroes by medals or statues; thereby testifying her twofold good sense, seeing that posterity does not always ratify the passions of contemporaries, and that the mania for erecting statues almost invariably results in the disfigurement of public places by blocks of stone, marble or bronze which are simply grotesque. Do not think that in saying this I am alluding to one country more than another.

I shall leave M. Yriarte on the threshold of what he calls "la Ville et la Vie." The quantity of information he gives us on the subject is what was to be expected from an active, eager, communicative young man, who at every turn—in the street, the café, the theatre, the gondola—opens his notebook to jot down some conversation, or distinctive trait, or artistic or historical observation that has attracted his attention. I

have only been to Venice once, and then for too short a time, but the memory can never be effaced: the brilliant and delicate splendour of her atmosphere, the courtesy of her inhabitants, the silence of her thoroughfares without horses and without children (the children are all brought up on *terra firma*), the grace of her very poverty, the complaisance of her learned librarians and the curators of her museums, the facilities of her material and intellectual life, left the sweet and well-ordered impression upon me of a sort of vast convent, similar to the one described by Rabelais under the name of "l'abbaye de Thélèmes."

One must think of Venice often, talk about her in low tones with a friend, and not look at her in photographs. PH. BURR.

The Land of Bolívar; or, War, Peace, and Adventure in the Republic of Venezuela.
By James Mudie Spence, F.R.G.S. (London: Sampson Low & Co., 1877.)

WHEN Canning encouraged the South American insurgents in their struggle for what he and perhaps they fondly believed to be freedom, and when he boasted that he had "called a new World into existence to redress the balance of the Old," he took what we should now pronounce a somewhat sanguine view of a very interesting project. Could he see these Republics at the present time he would be compelled to admit that they offer but a pitiable spectacle to the friends of civilisation and humanity. With the exception of Chili (and the case of Chili, though hopeful, is still a problem to be solved), not one of these rudely-constituted nationalities has shown itself capable of self-government or worthy of independence. Faction, avarice, official corruption, and the grossest political knavery, breaking out periodically in civil war, wantonly provoked and cruelly waged, have been from time to time the characteristics of each and all of these experimental administrations. Of some, indeed, such may even now be said to be the normal condition.

Nor can we exclude Venezuela from the general list in spite of the favourable view taken of "the Land of Bolívar" by Mr. Spence in the book before us; and looking to the events of the past fifty years, we contend that we are justified in the counter-view which we take, not only by these but by the solemn and melancholy words of the neglected Liberator himself, that he found that the people for whom he had striven were strangers to virtue, and that he had wasted his life in ploughing and sowing the waters of the ocean.

Mr. Spence tells us of a Minister of the Republic who once congratulated Congress that there had been *only seventeen* Revolutions within the year. A gleam of satisfaction comes across us when we reflect that over two years have now passed in tranquillity, and we may yet hope that the Venezuelan Government may avail itself of the opportunity, amend the notorious errors of its ways, pay its debts, banish its childish jealousy of the Englishman and other respectable foreigners, and so invite once more the employment of English capital within its limits.

Our author seems of opinion that England has been wanting in her duty to this Republic.

"We did," he says, "a noble thing in aiding the Colonies of South America to obtain their freedom from Spanish despotism; but had we, in addition to this, helped in the construction of railroads, erection of telegraphs, and other mighty instruments of progress, they would have been more blessed in receiving, and we more profited in giving."

Now, there is a little confusion here of both facts and ideas; seeing that the aid referred to was given in days before railroads were known or telegraphs foreshadowed even in England itself, it was hardly possible for us to thus supplement our gift, such as it was, and in the years succeeding the efforts made by us to open up enterprise in Venezuela have met with but scanty encouragement. The curse of concessions, and the ineradicable thirst for extortion, must always operate against legitimate commercial venture.

If we take the case of the Quebrada mines and district, once the private property of the great Bolívar, and now belonging, by purchase, to an English company; if we look through the files of the Caracas newspapers, and then interview anyone acquainted with the process of the Quebrada undertaking, we shall marvel how the generous energy of the Englishman has been blindly but persistently and authoritatively opposed or ignored. Here we have a railway constructed—the only one in the country—actually in work; an important district given the means of developing its resources; and a new and flourishing port established at Tucacas. Now, what said the public press to these results on the inauguration of the railway? Why, that the entire enterprise was due to the President of the day, to his talent, to his liberality, to his public spirit, and even to his engineering skill; while the name of Englishman in the matter was studiously suppressed! It is true that the President on the occasion in question mentioned, and with some spirit, on the spur of the banqueting moment, the numerous obligations under which, from first to last, Venezuela lay to the English, "the saviours of the country," as Bolívar proudly called them after the "crowning fight" of Carabobo in 1821, but it will hardly be believed that the press of the country never dared to report the words that in an impulse of truthful generosity escaped the lips of President Blanco in February, 1877. So long as such a spirit prevails Mr. Spence and Venezuela cannot expect the capitalists of London to look with a kindly eye on Venezuelan investments, and the Venezuelans may turn for aid to Hamburg and Paris, the financial communities which they vainly court.

We regret all this, for we think that even now, with fair play, the capabilities of the country might be called forth, and English money be profitably employed. Those capabilities exist, though possibly not to the extent imagined by Mr. Spence, but we may say in passing that he is right in noting the fibre of the Majuey plant as of probable importance in future commerce; and, knowing Venezuela as we do, and acknowledging its peaceful condition under its present ad-

ministration, we certainly indulge some hope as to its future, and would be loth to class it indiscriminately with the unreasoning bluster of Peru or the insensate barbarism of Guatemala.

Mr. Spence, then, has done good in drawing public attention to Venezuela, and we hope that the result may be profitable to the country interested; but to the Republic of Venezuela itself it is necessary to address a word of warning. We would fain hope it has a fair prospect before it; but it must instil some honesty into its officials, and show more manliness and less petty huckstering in its public acts. The first step towards this is an independent press, which does not yet exist, and the Venezuelans should at once see to the promulgation of public news in a healthy form without fear or favour. We know what has been, and, we presume, would be again, the fate of the writer of distasteful truths in a Caracas paper, and the *Calaboose* of the country is an institution that most are satisfied with hearing of, and with which they have no desire to make acquaintance. Again, because they have succeeded in throwing off the Spanish yoke, it does not follow that they have achieved liberty, and they would do well to be less persistent in their monthing of that sacred word.

And now about the book itself; it is fairly written, and the style of its publication is creditable, but the first volume nearly exhausts the information and the interest; for the second is filled with no less than six weary chapters on the ascent of the Silla Mountain and the Naimatá Peak. Another, recounting the history of certain mining concessions, might well have been omitted, for these have passed into the limbo of things that were, though Mr. Spence is discreetly silent on the subject, and their only practical result seems to be that Mr. Spence is entitled to wear, if he be anxious to do so, the order of the "Busto del Libertador" on his enterprising breast.

Consul Hemming's concession for traction engines, like other privileges of a like character, has no existence, and, among other blunders, we might remark on the establishment of an imaginary Vice-Consulate at Maracaybo; while, unless some very recent change has been effected, it is not quite correct to say that the Vice-Consul at Puerto Cabello does duty unpaid.

Appendix B might have been advantageously left out, for it gives a lugubrious account of schemes begun and never accomplished. These number ninety, though we have heard them put at a higher figure, and the story is the same of all. They are "commenced;" their "construction is ordered;" they are "being carried out," or "in course of survey;" "all difficulties have now been conquered, and the works are proceeding;" and so on, in what we may call monotonous variety: but the fact remains that of all these remarkable works hardly one is near completion, or likely to be so, and the only one actually and creditably accomplished, in spite of innumerable obstacles, is the Bolívar Railway, already spoken of as the work of an English company.

Our author has thought fit to reproduce the carpings of the official mind at the un-

avoidable geographical proximity of Trinidad and Curaçoa. They are "hot-beds of conspiracy," but Mr. Spence not very ingenuously hides the fact that the "conspirators" are not natives of these islands, but banished and malcontent Venezuelans. When Mr. Spence suggests that Curaçoa should be "blotted out of existence," he should be-think him of the answer made by the Viscount Cermenin to the Parisian deputation in 1836 that they "seemed to flatter themselves they had suppressed rain because they had abolished gutters!" The allusion also to the Curaçoa population as "a half-naked mongrel race" is not only in bad taste, but it invites an inconvenient comparison with the lower classes of Venezuela, for when real work is wanted from the native in that part of the world, the "Hollandaise," as he is called, will be unquestionably preferred by the employer who knows what work is. Nor do we understand what Mr. Spence means by looking to Venezuela for the meat-supply of the West Indies, especially after his own experience of what he describes as the "Dread Banquet of Tacata" (vol. i., p. 253).

On the whole we may say, though we object to Mr. Spence's too-flattering description of his tropical friends and their surroundings, that we should do him injustice did we not pronounce his book interesting and worthy a place in this class of literature; and we are specially minded to commend to all future authors his excellent example in giving a full Index, which adds greatly to the value of a useful work.

W. T. MERCER.

Scriptores Rerum Langobardicarum et Italicarum. Sæc. VI.-IX. (Hannoverae, 1878.)

THE laborious studies by Bethmann on the Lombards and their history have long been well known. He was not able to bring his work to a close before his death. But his interesting account of Paulus Diaconus, and his study of other Lombard authorities in the earlier issue of the *Archiv*, vol. x., 1849, have always been the source to which writers on these subjects since his time have referred for their information. Meanwhile Prof. G. Waitz has been known, from notices and papers from time to time in the *Neues Archiv*, to be following up the labours of Bethmann. The result of these labours, in the form of a collection of materials for the history of the Lombards, has been promised for some time. It has now at length appeared within the last few days, and will be heartily welcomed by all students of early mediæval history. It appears as a volume of the *Monumenta Germaniæ Historica*, and in a much handier form than the earlier volumes issued under Pertz. It differs also from the earlier *Monumenta Germ. Hist.* in being a collection, more after the manner of Jaffe's *Monumenta*, of all the historical matter which bears on a single period in one volume.

Instead of having to gather the materials from several folios of Muratori and Ughelli, the *Acta Sanctorum*, the earlier volumes of the *Monumenta*, or in some cases the reproductions of Migne, the student of the history of the

Lombards has now before him in one volume all the most important historical matter, and that in a much more perfect form than before. Together with the *Codice Diplomatico* of Troya and Bluhme's edition of the Laws, this moderate-sized quarto will provide nearly all that is needed for a thorough study of the history of the Lombards.

That history has never been very fully dealt with in England, and in some cases where it has been alluded to, there has hardly been sufficient allowance made for the position of the Lombards or sufficient recognition of what they actually did for Italy. The statements of the Popes, from the "nefandissimi" of Gregory the Great to the "non dicenda gens" of Gregory II. in the beginning of the eighth century, and the "foetentissima gens de cujus natione et leprosum genus oriri certum est" of Stephen IV. at its close, have been perhaps too literally received. No doubt the Lombards were barbarians and acted as barbarians at first. But it was the natural policy of the Popes to make the worst of the Lombards to the end. The aim of Rome was to retain and extend her own personal supremacy. Neither on ecclesiastical nor political grounds was she ever desirous to be permanently friendly to the chief power in Italy, whatever it might be. The kingdom of the Lombards suffered, no doubt, from the same weaknesses as those which afterwards broke up Charles's Empire. But it was not so much internal weakness as the combination of external forces which led to its fall.

It is not possible to enter here into the whole question of the relation of the Lombard rulers to their subjects. But many of the later laws of kings and dukes at least show an earnest desire to legislate wisely for landholders, traders, and the common people alike, and to weld Italy gradually into a united whole. There is the strongest evidence, also, of a fresh and vigorous religious enthusiasm, especially under the later rulers. But perhaps the best evidence of the value of what they had done is to be found in the desire of Charles the Great to be received, as far as possible, as a successor of the Lombard kings, and to retain their laws and institutions. Or, again, in the sincere friendship between Charles and a true-hearted patriotic Lombard like Paulus Diaconus, himself an outcome of the learning and culture of Lombard courts. For while Rome had produced no literature since Gregory the Great, and seemed to be sunk in the deepest ignorance, the Lombard courts of Pavia and Benevento were almost anticipating the Court of Charlemagne. At the court of Pavia, under King Rachis, there were schools and professors. There Paulus Diaconus, whose history of the Lombards is one of the fairest and best of any written in the early Middle Ages, laid a solid foundation of knowledge, not only of Latin but of Greek literature. There Alouin in his youth heard a disputation between Peter of Pisa and a Jew. There, too, Adalberga, the daughter of King Desiderius, received instruction from Paulus Diaconus, who probably followed her when she became Duchess of Benevento, and was by her encouraged to write his Roman history,

which was largely used in later centuries. The attractions of Monte Cassino induced Paulus after a while to enter that monastery, and to Monte Cassino, after five years' apparently happy sojourn at the court of his new friend and patron Charles, he returned to write his great history of the Lombards before his death.

The new edition of Paulus Diaconus' *Historia Langobardorum* is undoubtedly the most important single portion of the collection before us. The labour that has been spent upon this can only be judged by a reference to the above-mentioned studies of Bethmann, and to Prof. Waitz' introductory matter in this edition. A new edition of *Agnellus Liber Pontificalis Ecclesiæ Ravennatis* (by Dr. Holder-Egger) will be also most useful, and this not only for purposes of general and social history. In the criticism of the unique period in the history of art which Ravenna supplies, Agnellus is an authority of the highest importance, as may be seen in the use made of his work by Dr. Richter in his late book on the Mosaics of Ravenna. A selection is made from the Dialogues of Gregory the Great of matter bearing on Lombard history, and the valuable work of Erchempert on the later Lombards of Benevento is republished. Including chronicles, lives, catalogues of kings and dukes, and other original materials, the collection contains about fifty documents. Some matter is now published for the first time; some carefully re-edited from earlier volumes of the *Monumenta*; some re-arranged, as in the case of the *Chronica S. Benedicti Cassinensis*. The *Life of S. Barbatus*, one of the very few lives of this period in Italian history, has received special attention and care from both Bethmann and Prof. Waitz, as the earlier editions were very imperfect. Not only does it throw a curious light on the character of the times, but it affords a remarkable instance of serpent and tree worship.

Towards the end of the seventh century, we are told, the city of Beneventum was besieged by an army from Constantinople. Romuald the duke was in the city, and with him the priest Barbatus remained. The city was on the point of being taken, and all hope was given up, when Barbatus promised that the Lombards should yet be saved if they would give up their evil habits—the worship of a tree and the worship of the image of a viper. The promise was made, the town was saved, and on the very next day Barbatus himself shouldered an axe and cut down the tree with his own hand. Soon after this they elected Barbatus as their bishop. But Romuald and his companions, while they openly professed to obey his preaching, in secret worshipped the image of a viper. At this the wife of Romuald was very grieved. And once, when Romuald had gone out hunting, Barbatus went to her and said that she ought to bring him the image. And she replied, "If I do this, I know of a surety that I shall die for it." But she brought the viper, which Barbatus at once caused to be melted down into holy vessels, which were used when Romuald came to church on Easter Day. When the service was over the bishop charged the prince with having worshipped

the viper in secret. Romuald, full of sorrow, promised to give him the image to do with it what he would. "There is no need of that," replied the man of God; "it has already been turned into holy vessels."

"On hearing this Romuald said, 'I pray thee, most beloved father, to tell me how it was brought to thee.' 'I confess,' said the blessed Barbatus, 'that when I was speaking with your wife in much sorrow concerning your sin I asked and received it from her.' Suddenly one of those that stood by said: 'If my wife had done such a thing, I should have cut off her head without a single moment's delay (nullo interposito momento).'"

The bystander, however, who was so ready to cry, "off with her head," met his reward:—

"To whom the most blessed Barbatus turned and said: 'Because you try to assist the devil, you shall be the servant of the devil.' At once the man was seized with the devil, and began to writhe in anguish. And then the bishop added: 'There shall never be a time when some of your descendants shall not be tormented with a devil.' And even now his descendants are always found to be vexed with an evil spirit."

Of the history of the Lombards as a whole we have as yet no good general study, though there are valuable studies of special portions of it such as those by Abel, Pabst, and Hirsch. We may, perhaps, gather from a passage in the work now before us that Dr. Dahn is about to do for the Lombards what he has already so ably done for the Ostrogoths. Such a history is much to be desired, and Professor Waitz has done a great deal to lighten the work of future labourers in this field. He modestly hopes that his collection will be found valuable "not only by the Germans, but also by the descendants of the ancient Lombards and Italians who have now at length been united into one people." It cannot be doubted that his work will be of supreme usefulness to all students, in whatever country, of the early mediæval history of Italy.

ARTHUR H. D. ACLAND.

NEW NOVELS.

Estelle. By the Author of "Four Messengers." In Two Volumes. (London: George Bell & Sons, 1878.)

Paul Knox, Pitman. By John Bewick Harwood. In Three Volumes. (London: R. Bentley & Son, 1878.)

Her Father's Child. By Mrs. W. R. Snow. (London: Remington & Co., 1878.)

THE writer of *Estelle*, already known for commendable work, has chosen a theme in this, her latest story, which is in a great degree unfamiliar to the ordinary English reader, namely, the inner life of a cultured middle-class Jewish family, whose members are habitually brought into friendly contact with Gentiles. She writes as though herself a member of just such a household, and thus, albeit the interval of mere literary power between *Estelle* and *Daniel Deronda* is enormous, the newer story reads like a more trustworthy narrative, a truer record of facts, set down by a sympathetic pen, than the brilliant *tour de force* which has treated modern Judaism from without as just so much raw material to be worked up into

artistic effects. And although there is perhaps this one element of genuineness in George Eliot's novel, that the description of the claims of race as the most powerful factor in guiding conduct (which meets us in the *Spanish Gipsy* also) denotes the author's own convictions, yet the catastrophe of the plot is as distasteful to a philosophical thinker as it proved to be to the ordinary novel-reader, on the ground that the acceptance of Judaism in the only form in which it can really be adopted by a Christian proselyte now, namely, its Rabbinic or Talmudic phase, involves both intellectual and social retrogression, and that in a degree so marked as would almost have justified Comte in putting George Eliot in his calendar along with the Emperor Julian and Frederick II. of Prussia, among those chief enemies of progress who have tried to drive mankind backwards. There is nothing of this kind in *Estelle*. On the contrary, though ardent patriotism, or, more correctly speaking, nationalism, discloses itself throughout, and the type of Judaism set before us is the conservative one, and not that of those newer reformed synagogues whose teaching is scarcely discernible from Gentile Theism, yet the inroad is clearly shown to be from the Christian side, and not conversely; and we have laid bare for us longings after Gentile culture and breadth, secret or open chafings against traditional restrictions, and keen sympathy with various distinctively Christian forms of thought, as all found in the younger members of a strictly orthodox Hebrew family, and that in a fashion which justifies the reader in believing that he is invited to examine types rather than individuals. The story, which is a very slight one, is wholly subordinated to working out this complex idea; and although there is more grace than power exhibited, conscientious labour has been freely given, and a book of real psychological interest has been produced. As in a former work from the same pen, there are scraps of verse intercalated occasionally, which have a true, though not very deep, vein of lyrical feeling, at any rate sufficient to show us that the author might write songs for music far superior to the average nonsense verses too commonly sung in the modern drawing-room. And this would be a charity to those guests who still think more of sense than of sound.

Paul Knox, Pitman, though not a novel of much originality or mark, is a distinct advance on the coarse and flaring sensationalism of the writer's two previous stories, *Lady Flavia* and *Lord Lynn's Wife*, whose element of cleverness did not atone for their lack of taste. The present book belongs to a better school, and albeit tokens of inexperience in an unaccustomed style are visible, yet Mr. Harwood will do well to persevere in this rather than in his former road, and he can at any rate be credited with the study of good models. His hero is a blend of Paul Tregarva and Felix Holt, a stalwart, intellectual, almost refined Methodist collier, willing to abide in his class, though able to rise socially above it. The plot is a variant of one which has been treated many hundreds, not to say thousands, of times before, namely, the finding of an

infant waif—this time the child of an unknown victim in a railway accident—who turns out at last to be a great heiress. The one thing in which the author has been courageous is in making her marry a suitor of high social grade, instead of rewarding the pitman for his constant affection. He has not attempted to give very marked local colour to his Northumbrian scenes, though they pass muster fairly well, and he has worked in, not unsuccessfully, the entombment and rescue of last April in the Troedyrriw colliery, in order to give interest to his description of a north-country mine. Another rescue, this time from the results of the bursting of a reservoir, recalls Mr. Charles Reade's *Put Yourself in His Place*, but is not by any means so vigorous. Once more, judicious study is visible in the visit paid to the heroine, Mary Gwynn, by Lady Elizabeth Shafto, mother of the favoured suitor, in order to break off the engagement. It is "conveyed," and that somewhat crudely, from the inimitable scene in *Pride and Prejudice*, where Lady Catherine de Bourgh descends on Lizzy Bennet, though made to end somewhat differently; and it is something, in days when novels like *Cherry Ripe* are written and read, to have resorted to models like Jane Austen. But if he had imitated her in such respects as saying "weekly wages" instead of "hebdomadary guerdon," and had left out such classical lore as Mount "Tageton," presumably for "Taygetus," his work would be none the worse.

The aim, if any, in writing *Her Father's Child*, seems to have been to point out the inequality of pressure caused by the working of the Divorce Act, which leaves a woman, whom her husband has deserted in order to live with some one else, at a great disadvantage when compared with a man similarly quitted by his wife; inasmuch as not only is the fact of her being deserted taken as a presumption against her character, so as to prevent her from obtaining situations, but the remedy under the Act is much less accessible to her. The book, however, is dull, and, in attempting realism, has more than a flavour of coarseness about it, by no means pleasant. Apart from this fault, there is a quite superfluous degree of imbecility attributed to the heroine, who breaks off an engagement because believing, on the evidence of a profile seen through a blind, that her lover is the evening visitor of the scarcely dubious occupant of a neighbouring *cottage ornée*, and that, although the marked likeness he bears to the reprobate of the story is perfectly well known to her, though she nearly hunts the said reprobate, an old acquaintance, down, and hears a familiar oath from his lips, and though he deserts his wife and goes off with the adventuress a few days later. Nevertheless, the guiltless lover is not acquitted and reinstated till the address of the former occupant of the cottage, in the handwriting of the other man, is found in a blotter, nor does so much as a suspicion of the true state of the case dawn till then on the heroine's mind. The story is a poor specimen of a very inferior school.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

Non-Christian Religious Systems. — Hinduism, by Prof. Monier Williams. *Buddhism*, by T. W. Rhys Davids. *Islam*, by J. W. H. Stobart. (Society for Promoting Christian Knowledge.) That a society for promoting Christian knowledge should publish three volumes on "non-Christian religious systems" is a significant fact, and it is even more significant that two of these volumes at least should have been placed in the hands of thoroughly competent scholars and independent investigators. The volumes on Buddhism and Hinduism are at once clear, comprehensive, and sympathetic, and distinguished by the accuracy we should expect from their authors. Of the two, that on Buddhism is perhaps the best; indeed, we do not know of any other work from which so fair and complete an account can be obtained of that wonderful religion which has so much in common with Christianity, and numbers more adherents than any other religion in the world. We cannot speak so highly of the volume on Islam. The author's information is given at second rather than at first hand, and yet he writes with a dogmatic assurance seldom found in the works of genuine scholars. His treatment neither of Muhammad nor of the religion he founded is impartial, and this is particularly unfortunate at the present time, when an accurate statement of the true nature and tendencies of Muhammadanism is greatly wanted. The tall talk, too, in which he occasionally indulges contrasts unfavourably with the critical calmness of Mr. Rhys Davids and Prof. Monier Williams. The volume on Buddhism will no doubt prove the most interesting to the majority of readers, to whom many of the facts it contains will be extremely startling. It seems strange at first sight that a religion which is based on atheism should not only have attracted so many followers but should also inculcate so pure and sublime a morality, and have succeeded in producing saints, missionaries, and martyrs who may bear comparison with those of our own creed. Nothing can be more touching than the sayings of the Dharmapada or the lives of men like the Chinese Buddhist pilgrim Hiouen-tsang. Like Christianity, however, Buddhism has accommodated itself to the beliefs and practices of the peoples to whom it has been preached, and Mr. Rhys Davids tells us that "many of the Ceylonese so-called Buddhists, for instance, take their oaths in court as Christians, and most of them believe also in devil-worship and in the power of the stars." He gives a very clear account of the Nirvāṇa, which is the goal of every Buddhist and the sanction of his morality. Nirvāṇa is not annihilation, since the saint may live on after having obtained it; it is rather the extinction of that sinful, grasping condition of mind and heart which is the root of all evil and the cause of renewed existence and consequent misery. The volume contains a very good account of the life of Buddha—so far as it can be detached from the old solar myths which have fastened upon it—as well as of the Buddhist beatitudes, sermons and other curious parallels of Christianity. Prof. Monier Williams's *Hinduism* is equally a storehouse of information. The Hindu Scriptures and Sects, their idol-worship and philosophy, their doctrines and history, are all presented to us in a compact and lucid form. Those who wish to know the thoughts and beliefs of our Indian fellow-subjects cannot do better than study this little book. And it is only by knowing the thoughts and beliefs of the Hindu that we shall ever learn how to govern India aright, and to guide and educate its inhabitants. Prof. Monier Williams agrees with Mr. Rhys Davids in regarding Hinduism and Buddhism as less antagonistic than has usually been supposed. Buddha's whole training, in fact, "was Brahmanism; he probably deemed himself to be the most correct exponent of the spirit, as distinct from the letter, of the ancient faith; and it can only be claimed for him that he was the greatest

and wisest and best of the Hindus." The Society for Promoting Christian Knowledge is to be congratulated on the useful contribution it has been the means of making to the science of religion; it is only a pity that the history of the great puritan religion, Muhammadanism, was not committed to as competent hands as the history of Hinduism and Buddhism.

Aus vier Jahrhunderten niederländisch-deutscher Kunstgeschichte Studien, von Alfred Woltmann. (Berlin.) This extremely tasteful volume by the author of *Holbein und seine Zeit* consists of lectures given by Dr. Woltmann in Berlin, Vienna, Prague, and various towns on the Rhine. The essays have an internal connexion, their object being "die moderne Kunstentwicklung der germanischen Völker in bedeutenden Momenten zu charakterisieren." The following deserve special notice:—"Die Anfänge der deutschen Renaissance," "Peter Paul Rubens," "Van Dyck am Hofe Carl's I.," "Franz Hals und Rembrandt," "Hogarth und Chodowiecki," "Cornelius und seine Genossen in Rom," "Kaulbach." Though in all the subject is naturally treated more especially from the aesthetic point of view, there is no want of the soundest historical research. Though the keen critical mind of the author rejects many received opinions, he shows himself capable of doing justice to the most varied phenomena in the history of art. One remark in the essay on Van Dyck is disputable. Dr. Woltmann supposes that in Charles I.'s time the Cavaliers and their opponents were distinguished from each other by the cut of their hair. Now, the term "Roundhead" is well known to have been most incorrectly applied to all the members of the Puritan party. A glance at the portraits of Hampden, Milton, Cromwell, tells us that the nickname was anything but applicable to them. Dr. Woltmann's book is published by the Allgemeine Verein für Deutsche Literatur, which has already published works by Bodenstedt, Sybel, Paul Heyse, Berthold Auerbach, and others, and to which we beg to draw the attention of the English public.

A Short History of Egyptian Obelisks. By W. R. Cooper. (Samuel Bagster and Sons.) This is a well-timed little book. Mr. Cooper tells us briefly and pleasantly most of what is known about the history and nature of the obelisks of Egypt, and gives translations of the inscriptions found upon them. In some cases, however, the translations are not the most recent, while misprints and slips occur which ought to be corrected in a second edition. The obelisk symbolised the sun-god, and, since the monarch was regarded as a manifestation of the latter, the inscriptions it bore were generally in honour of the sovereign by whom it was erected. The oldest known obelisks are those set up by Osirtesen, the first king of the twelfth dynasty, at Heliopolis and Biggeh; Cleopatra's Needle belongs to the eighteenth dynasty, having been originally a monument of Thothmes I., and is thus older than the obelisk of Paris, which was erected by Ramses II.

A HISTORY of the Plantation of Ulster from the pen of a thoroughly competent and impartial writer like Dr. Russell would be a valuable contribution to history. *An Historical Account of the Plantation of Ulster*, by the Rev. George Hill (Belfast: McCaw, Stevenson and Orr), is the work of a writer with some local knowledge, who has taken much pains with his subject, but who fails entirely to rise to the impartiality of history. It is quite intelligible that the light way in which some English writers are apt to pass over the terrible story of the disappropriation of a people should raise feelings of indignation in those who regard the subject from a different point of view. But we may at least ask of the author to try to understand the feelings with which men like Chichester and Davys approached the almost insoluble problem of Irish government. This is what Mr. Hill, in our opinion, fails to do. But whether Mr. Hill is right or wrong in his

deductions, every scholar will protest against his unwarrantable practice of quoting passages from the Calendars of State Papers as if they formed part of original documents. The editors of those Calendars perform a work the value of which it is difficult to overestimate. But they would be the first to object to see their abstracts in the third person copied out as if they proceeded from the pen of the writer of the despatch before them. It need not be said that Mr. Hill has no intention to deceive, and that the truth is evident to any one in the slightest degree familiar with such matters. But when he says that Chichester writes so and so, which he places between inverted commas, or comments upon the style in which a letter is written, as in page 222, which has been manipulated by some one else before it reached him, all that can be said is that it is to be hoped he will find few imitators in so slovenly a practice. Mr. Hill, in fact, has not taken the trouble to bring to light from MS. sources the materials which exist. His work is mainly a compilation from printed books, and he even reprints Prynard's *Survey*, which was published twice in the last century, without collating it with the MS.

DR. H. BAUMANN, assistant-keeper of the Donau-eschingen Records, has lately published two works of considerable importance for the history of the German Revolution of 1525; the one, *Quellen zur Geschichte des Bauernkrieges in Oberschwaben* (Bibliothek des literarischen Vereins in Stuttgart), containing a number of chronicles and other historiographical records little, if at all, known until now; the other, *Akten zur Geschichte des deutschen Bauernkrieges aus Oberschwaben* (Freiburg), containing documents of all kinds derived from numerous South-German archives bearing upon the grievances of the peasants, the measures taken by the Governments, the treaties between the insurgents and their lords, &c. Many of these documents might with advantage have been left out or abridged, but no one can deny Dr. Baumann's claim to our lively acknowledgment for his diligence and skill.

MR. THOMAS CRADDOCK's essay on *Rousseau* (A. Hall and Co.) is one of a class of books which have something rather pathetic about them. They are usually the work of some well-meaning and studious, but not very cultivated or clear-sighted, man who has fallen into a misunderstanding, and is busying himself to prove something which nobody in his senses ever denied, or to disprove something which nobody in his senses ever asserted. Mr. Craddock's particular windmill is what he calls the habit of "crediting Rousseau with the French Revolution." He seems to think that those critics who magnify the influence of Jean-Jacques on that event are of opinion that but for him there would have been no French Revolution at all, and that its characteristics of sentimentalism, appeals to first principles, &c., &c., were visible for the first time in Rousseau. So he sets himself very innocently to show that there were other causes for the Revolution, and that Hobbes, Locke, and a dozen other people had anticipated a great many of Rousseau's sayings and thoughts. As he quotes Mr. Morley's precise limitations of Rousseau's influence to "doing more than anyone else at once to give direction to the first episodes of revolution and force to the first episodes of reaction," his *ignoratio elenchi* is particularly surprising. But the nature of Mr. Craddock's mind is perhaps best shown by his inability to reconcile the assertion that Rousseau "had reverence for the loftiness of duty," with another assertion that he "never felt duty as a bond." Did Mr. Craddock never hear of Ovid, St. Paul, and a good many other people, who could not adjust their theory and their practice? In the course of his book he has occasion to tell over again, chiefly from the *Confessions*, the history of Rousseau's life, but it cannot be said that he throws much additional light on it. As for his literary judgments, it is perhaps sufficient to say that he regards Byron's *Heaven*

and *Earth* as being "as great as Milton," and Byron's tragedies as being "equal to those of Marlowe, Ford, or Webster." We must add that the style of the book is far from admirable, and that the proper names in it are misprinted with a most remarkable and irritating persistency.

NOTES AND NEWS.

At the recent annual meeting of the Royal Irish Academy, Dublin, Mr. J. T. Gilbert, F.S.A., was elected Librarian and Member of Council, from which posts he had retired on leaving Ireland in 1876, in consequence of temporary indisposition.

A NEW periodical, devoted to the cause of education, and entitled *Revue Pédagogique*, has lately been established at Paris under the direction of M. Ch. Hanriot.

WE understand that Mr. Ashton W. Dilke is engaged upon a translation of Tourguénief's last novel, *Now*, or "Virgin Soil," which will be published soon after Easter by Messrs. Macmillan and Co.

MESSRS. MACMILLAN AND CO. have in the press a new work by Prof. Fawcett, M.P., entitled *Free Trade and Protection, with Special Reference to the Causes which since the Introduction of Free Trade in England have retarded its Progress in other Countries*.

MESSRS. C. KEGAN PAUL AND CO. are about to publish a book on the *Theory of Logic*, by Mr. Carveth Read. It is an attempt to show the objective character of the science.

WE hear that Mr. Matthew Arnold has made a selection from Johnson's *Lives of the British Poets*, designed to meet the needs of students of English literature who want a good history of the poetical literature from Waller to Gray. The volume, which will contain a preface from Mr. Arnold's pen, will be published about Whitsuntide by Messrs. Macmillan and Co.

MR. WEDMORE has written, specially for the next number of *Temple Bar*, an article on Cruikshank, dealing in chief with such artistic merits in the works of the veteran artist as he believes to have been thus far but scantily recognised by the public that has long appreciated that which is mainly caricature.

THE *Nuova Antologia* for March has an article by Signor Bonghi on "Leo XIII. and his Predecessors of the same Name." After a review of the careers of the Leos he points out that the first nine Popes of that name exercised no temporal power, while Leo X. exercised it to the great prejudice of the spiritual power, and Leo XII. brought it to its ruin by showing that it was opposed to the wishes of the people. Signor Bonghi hopes that this recognition of the incompatibility of temporal and spiritual power may have influenced the present Pope in the choice of his name. Signor de Gubernatis has an interesting article on "The Russian Woman," in which he defends Russian ladies from the character ordinarily assigned to them in French novels and on the stage; he collects from contemporary history instances of their heroism, of their deep family affection, and of their moral worth.

MR. SAMUEL R. GARDINER has been elected honorary student of Christ Church.

THE *Gentleman's Magazine* for April will contain an article by Mr. Frederick A. Edwards on Mr. Stanley's recent exploration in Africa.

MR. R. OUST's work on the *Languages of the East Indies* will appear about Easter. It will contain maps, bibliographical lists, and complete accounts, linguistic, historical, statistical, and geographical, of the multitudinous tribes of India, so far as can at present be known. A sample of the work has already been presented to the public in the language-maps published in the January

number of the *Geographical Magazine*, and the last volume of the *Journal of the Royal Asiatic Society*.

DR. L. O. SKREFFERUD, who published a Grammar of the Sonthal Language in 1873, is engaged upon a valuable philological work. This is a Comparative Grammar of the Kolarian family of languages, of which Sonthal is a principal member. It purposes to do for this group of tongues what Bishop Caldwell's Comparative Dravidian Grammar has done for the Dravidian dialects.

WE are glad to hear that the Rev. A. J. Church, whose admirable *Stories from Homer* were published by Messrs. Seeley last December, is engaged upon a companion volume of *Stories from Virgil*.

THE March number of the *Theologische Tijdschrift* opens with a paper by the celebrated theologian Dr. J. H. Scholten, on the meaning of the expression *ἀσέβεια* in 1 Corinthians. He concludes that *ἀσέβεια* means "an obscure expression" (following the usage of classical Greek). Some of the Corinthians in an ecstatic state expressed their highly-wrought feelings in unconnected discourses, made up of fragments of psalms, prayers, and exclamations, which were unprofitable to the hearer without an interpreter. Dr. Kuennen continues his series of papers on Pentateuch-criticism; Dr. Rauwenhoff discusses the rearrangement of theological studies, which has now become a practical question in Holland; Dr. Blom gives a new explanation of Gal. iii. 20; Dr. Scheffer continues the controversy on pessimism; and Dr. Tiele criticises, among other works, the handbooks on non-Christian religions published by the S. P. C. K. (for historical students, he will only recommend the manual on Buddhism, by Mr. Rhys Davids).

THE restored Hebrew text of the Epistle to the Hebrews—or at least that which professes to be such—is about to be published by Dr. J. H. R. Biesenthal. The author professes to have cleared up many obscurities of the Greek text (e.g., ii. 13, vii. 4, ix. 16) by simply translating the Greek back into the language of the Mishna. He accepts the statement of Olemens Alexandrinus that the Epistle was written in Hebrew by Paul, and was translated by Luke into Greek for the use of Greek-speaking Christians. Subscribers' names to be sent to the author at Reudnitz bei Leipzig.

DR. KARL WARNEB and Dr. Ludwig Proescholdt have just published at Halle a very careful and handsome edition, with full collations, of *The Comedy of Mucedorus*, 1598. The text is unfortunately modernised; but the Introduction is painstaking and sensible. The editors of course repudiate the notion of Shakspeare having had any hand in the additions made to the play in 1610 to please James I.

PROF. ZUPITZA says in the *Anglia* that he hopes soon to issue a critical edition of the Early English romances of Sir Isumbras, King Orpheo, and Athelstan.

HENRIK IBSEN's new comedy, *The Pillars of Society*, recently reviewed in our columns, has been translated into German by E. Jonas, and is at the present moment either being played or rehearsed at no less than thirty German theatres. If English managers had any real enterprise they would secure a version of such a piece as this for the London stage.

THE Cambridge University Commissioners have addressed an important communication to the Vice-Chancellor, which has been printed for the information of the Senate. In this statement they specify in some detail the main classes of objects for which the colleges will be requested to contribute pecuniary assistance to the University Chest. These objects are briefly: 1. The erection of additional buildings; 2. The maintenance of such buildings, and also of the personal staff required in connexion with them; 3. The increase of the teaching power, both by the creation of

new chairs and the augmentation of the stipends of existing professorships; 4. Grants for special work in the way of research, or for investigations conducted in any branch of learning or science connected with the studies of the University. Entire freedom is left to the individual colleges to determine for themselves the modes in which they will co-operate with the University in fulfilling these objects. But it is suggested that contributions should be made by the colleges as nearly as possible on a uniform scale throughout; and the commissioners roughly estimate that the needs of the University will ultimately require a sum equivalent to at least ten per cent. of the net income of the colleges.

AN extra number of the *Journal of the Bombay branch of the Royal Asiatic Society* contains a detailed report by Dr. G. Bühler of a tour in search of Sanskrit MSS. made in Kásmir, Rajputana, and Central India in 1875-76. One of the places visited was Khunmoh, a village beautifully situated on the slope of the hills, which was appropriately described by Bilhana as "a coquetish embellishment of the bosom of Mount Himalaya." Dr. Bühler succeeded in purchasing for the Indian Government between eight and nine hundred manuscripts.

MR. JOSEPH H. LONGFORD has compiled a valuable summary of the Japanese Penal Codes, which is printed in the *Transactions of the Asiatic Society of Japan*. The Criminal Laws are comprised in two Codes, published in the years 1871 and 1873 respectively. The "Chief Points of the New Fundamental Laws" are subdivided into 192 sections, and the "Revised Fundamental and Supplementary Laws" into 318 sections. This is the punishment for wife-murder:—"A husband who kills a wife for using abusive language towards, or assaulting his parents or grandparents, instead of appealing to the authorities, shall, if information of his crime be given to the authorities by the parents, be punished by penal servitude for one year."

A NEW edition of Prof. Bentham's *Handbook of the British Flora* is in the press, and will shortly be issued by Messrs. L. Reeve and Co. The same author having completed his *Flora Australiensis*, the final volume of which will be issued in a few days, is at work at his *Genera Plantarum*, a new part of which may be expected before long.

AMID the cloud of pamphlets on Indian matters that have recently appeared, we would draw special attention to one by Mr. H. Luttman Johnson, of the Bengal Civil Service, entitled *Indian Finance: a Short Sketch for Non-Indian Readers* (Allen and Co.). It is a relief to turn from crude theories and much fanciful speculation to this simple summary of facts and figures, which is calculated to give the ordinary reader a more accurate conception of the financial affairs of India than he probably possesses concerning those of his own country. But Mr. Johnson's little brochure is not a mere summary. The writer has evidently been at great pains so to arrange and analyse his materials that the lessons they teach should be presented in the most convincing guise; and he has added a running commentary of explanation and criticism, still further to drive the lessons home. The following are his practical conclusions:—

"The difficulties of increasing the revenue have been made too little of, while the difficulties of reducing the expenditure have been made too much of. Bengal, but not the rest of India, could bear increased taxation. Expenditure in Bombay is generally too high, as compared with the rest of India. The army might, with improved means of communication, be reduced. Lastly, a great saving might be effected by the substitution of native for European labour."

The whole pamphlet should be read by all who care to penetrate beneath the surface of the discussion.

THE *Deutsche Rundschau* for March has an article by Herr Bruno Bucher on "The Rock as a

Work of Art," which gives an historical survey of the artistic side of printing and binding, and bewails the falling-off noticeable within the last century in these points; the writer deprecates circulating-libraries, and urges the formation in every household of a small and carefully-selected library of books well printed and well bound. Herr Cohn contributes a series of unpublished letters of Schiller, three of which are addressed to Jacobi.

In the *Rivista Europea* of March 1, Signor Cesare Cantù begins a lively historical and literary sketch of Monti and his age. Signor Garollo continues his valuable paper on Theodorico, and brings down his history to the time of the coming of Theodorico into Italy. Signor Ugo Pesci has a careful article on the policy of the Medicean Grand-Dukes of Tuscany towards the Papal conclaves, in which he shows how the Medici used their power over the Church as a means of securing their political position in Italy.

THE *Revue Historique* for March has an article by M. Lantoin on "Cleon the Demagogue," which aims at taking an unprejudiced view of Cleon as a statesman. M. Lantoin discusses the value of Aristophanes as an authority, and then gives a survey of all that can be ascertained of Cleon's career; he concludes that Cleon followed in the steps of Pericles, though without the same moderation or political wisdom; that he pleased the people by his audacity, his patriotism, and his eloquence, for which they pardoned his extravagances, and, while taking him for their leader, tempered his policy by their own sagacity and moderation. M. Neuville finishes his paper on the "Parlement at Poitiers (1418-36);" and M. Sorel pursues his diplomatic studies on the Peace of Bâle, 1795. M. Combes publishes an account which he has discovered at Turin of the circumstances of the arrest of the Maréchal de Biron; the document is dated July, 1602, and had come through the hands of the Piedmontese *chargé d'affaires* at the Court of Henry IV., so that it may be regarded as almost an official account. M. Bouquier, under the title of a "Volunteer of 1792," gives an account of General Chérin, with extracts from his letters.

DR. ANDREA CRESTADORO, the chief librarian of the Manchester Free Library, has been appointed a Knight of the Order of the Crown of Italy. Cavaliere Crestadoro is best known in this country for the great and beneficial influence he has had upon provincial bibliography and library work generally, but he is also a writer on financial and scientific subjects.

THE "Ethics of the *Edda*," by Karl Blind, is the title of a systematic treatment of the rules of life among the ancient Germanic nations, which will appear, with the addition of poetical passages, in the *University Magazine* for April.

OBITUARY.

THE death of Prof. Johann Alzog, at the age of sixty-nine, leaves Karl Josef Hefele, Bishop of Rottenburg, well-nigh the sole survivor of that group of distinguished Roman Catholic theologians in Germany who set themselves to do, in the domain of ecclesiastical history, what Klee, Pabst, and Dieringer essayed in that of dogma. His aim was to continue the traditions of that cultured and philosophical aspect of religion which is opposed to the innovating school of Maria-Laach, and to combine adherence to this national type of thought with loyal acceptance of his position as a member of the vast hierarchy culminating at Rome. This was no easy task, as the entire unacquaintance with the German language, not to say theology, which prevailed at the Vatican, and notably in the case of Pius IX. himself, as well as the manner in which the Ultramontane school, availing itself of certain deviations from the received terminology which appeared in the works of Günther, set itself to stamp out the older system with the full assent

of the Pope, made concurrent action of the sort difficult at first, and impossible somewhat later. Prof. Alzog's life was an uneventful one, and marked by no more noticeable episodes than the attainment of certain posts of duty and the publication of a small number of works. Born at Ohlau in Silesia, in 1808, his diligence and success in theological study were such that as a mere youth of three-and-twenty he was named tutor in the seminary or training college at Cologne, three years before receiving priest's orders. In 1835 he was promoted to a post of greater influence and importance, as Professor at Posen, where he held the united Chairs of Ecclesiastical History and Biblical Exegesis. It was during his tenure of office in that seminary that he produced the work by which he is best known, the *Universalgeschichte der Christlichen Kirche, Lehrbuch für Akademische Vorlesungen*, originally published in 1840 at Mainz, in a single volume of about 1150 pages, but changed in its ninth and latest edition of 1872 into a two-volume form. It would give no very inexact notion of this work (which is allied to the schools of Fleury and of Noel Alexandre rather than to that of Rohrbacher) to say that the problem Dr. Alzog set before himself was to do for the history of the Christian Church much what Mr. Green has done in his *Short History of the English People*, a book to which it bears more than one point of resemblance, in its breadth of general conception, skill in selecting and grouping salient epochs and incidents, and also, it must be acknowledged, in occasional marks of prejudice and too frequent inaccuracy of details. But the book fairly merited the success it attained, not only in its native Germany, but in several foreign countries, notably France, Italy, and America. The English version issued in the last-named country, however, is about eight or nine times as costly as the original, and no English edition has been so much as projected, one of the many tokens of that lack among the Roman Catholic body in this country of intellectual life, and of interest in the literary aspects of religion, which forms a frequent topic of complaint among their more cultured members. In 1845 Dr. Alzog was transferred from Posen, and made a Canon of Hildesheim and Principal of the Diocesan Seminary there, as also of the Educational Institute. In 1853 he migrated finally to Freiburg in Baden, where he held till his death the Chair of Theology in the University. It is possible that his contact there with Von Hirscher, who revived in a somewhat aggressive form the teaching of Febronius in the last century, and anticipated the Old Catholic movement, may have produced some reaction in Dr. Alzog's mind from the views of Möhler's *Symbolik*, which he had previously maintained. Certain it is that during his later years, at any rate after the severe rebuke of the famous Munich Congress of 1863, in which he took part along with Dr. Von Döllinger and the then Abbat Haneberg, he yielded more and more to the pressure of the Ultramontane party, and though nominally at first a member of the Opposition during the Vatican Council, to which he was invited as a theologian at the special instance of Cardinal Schwartzberg, precisely that he might serve as a counterpoise to Franzelin and the other Jesuit divines who sat on the preliminary commission, he took up almost immediately the least dignified or logical of all positions, that of the "Inopportunist," who admitted the abstract truth of the Infallibility dogma, but objected to the present expediency of defining it. This was his moral suicide, and from the date of his vote on February 11, 1869, he ceased to be a personage of importance, save for the memory of past services, in the Catholic world. Besides his chief work, he was also later the author of a *Handbuch der Patrologie*, in which his power of presenting a complex subject as an integral whole in popular form reappears. It reached a second edition in 1876, and is a very convenient manual. His remaining writings, except the *Grundriss der Uni-*

versal-Kirchengeschichte, are merely occasional, and of minor interest, though some valuable articles in the great *Kirchenlexicon der Katholischen Theologie* of Wetzer and Welte—a far better book, by-the-by, than Herzog's *Real-Encyclopädie* is as a Protestant dictionary—were contributed by him as it was issued, under his eye and at least partial superintendence, at Freiburg, in 1847-9. His submission to the dominant party in his Church has not secured the permanence of his influence, for that very moderation of his Church History which made it a useful agent for conciliating Protestants inclined to listen to Möhler has made it in return unsuited to the new condition of things brought in since 1870, and it is now being rapidly deposed from its former position as the accredited text-book for its subject in the seminaries of Germany, and will ere long, there is little doubt, be branded with the stigma of *impopularisme*. RICHARD F. LITTLEDALE.

AFTER several years of patient suffering Mr. James Hain Friswell died at Fair Home, Bexley Heath, on the 12th instant. Born at Newport, Shropshire, in 1827, he was trained for the legal profession, but penned a satire "when he should engross." The business in which he spent several years of his after-life was almost equally irksome to him. His first essays in literature were contributed to the *Puppet Show*, a paper started in 1848 by Albert Smith and Angus B. Reach. In 1854 he compiled a *History of the Russian Empire*, and in the following year edited a volume of *Songs of the War. Diamonds and Spades* (1858), *Sham* (1861), *Daughter of Eve* (1863), and *One of Two* (1871), are the titles of the chief novels which he published, but none of them possessed the elements of enduring life. His volumes of essays attained to greater popularity. The first series of *The Gentle Life*, originally published in 1864, has passed through more than a score of editions; the second series of *The Gentle Life, About in the World* (1864), *Varia: Readings from Rare Books* (1866), *Other People's Windows: a Series of Sketches* (1868), and *The Better Self* (1875), were all favourably received by the reading public as containing considerable information pleasantly reproduced. He edited reprints of Montaigne's *Essays*, Sidney's *Arcadia*, and Rochefoucauld's *Maxims*. His *Essays on English Writers* (1869) and *Modern Men of Letters Honestly Criticised* (1870) were more agreeable to his readers than to the victims whom he dissected. In 1864 he published a volume on the *Life Portraits of Shakespeare*, and in the succeeding year a compilation of an *Index of Familiar Words*. His own satirical and literary paper called *The Censor* enjoyed only a short life in 1868, but for many years his contributions have enriched the columns of the best periodical literature, and were continued almost to the last day of his life.

PROF. KARL LUDWIG ARNDTS, the eminent "Romanist," who for the last quarter of a century has held the Chair of Roman Law at Vienna, died in that city on March 1. He was born in 1803, at Arnesberg in Westphalia, where members of his family had occupied high judicial posts for some generations past. His father was Geheimrath and Hofgerichtspräsident in the Grand-Duchy of Hesse. The son received his early schooling at the Gymnasium of Arnesberg, and studied afterwards at Bonn, Heidelberg, and Berlin. In 1837 he was appointed a Professor Extraordinary at Bonn, and two years later received at the same time invitations to Breslau and to Munich. He accepted the latter, and in 1844 was named a member of the Bavarian Gesetz-Commission, and was charged with the drawing-up of a plan for a new Bavarian Bürgerliche Gesetzbuch. His work was interrupted by the excitements of the revolutionary year. Dr. Arndts was elected as deputy for Straubing in the National Assembly at Frankfurt, where he ranged himself on the side of the "Gross-Deutsch" party, but in May, 1849, he announced his exit. In 1855 he accepted the Professorship

of Roman Law at Vienna; in 1867 was called to the Austrian Herrenhaus; and in 1871 was raised to the Ritterstand, with the title of Von Arnesberg, from his Westphalian birthplace. Arndts' activity, both as teacher and author, was directed mainly to Roman Law, and only in a less degree to French Civil Law, to civil process, and to the encyclopædic range of legal science. He first became known in literature by his contributions to Weiske's *Rechtlexicon für Juristen aller Deutschen Staaten* (1839). His *Juristische Encyclopädie und Methodologie* has passed through five editions. An eighth edition of his *Lehrbuch der Pandekten* was published at Stuttgart in 1874. In union with Bluntschli and Pözl he edited the six volumes of the *Kritische Ueberschau der Deutschen Gesetzgebung und Rechtswissenschaft* (Munich, 1853-1858). Earlier, in conjunction with Bethmann-Holweg, Böcking, and other jurists, he published a *Corpus Juris Romani antejustiniani*. From time to time he sent to press a number of academical orations and lectures, some of which, together with many contributions to serials, were collected in three volumes, and published at Stuttgart in 1874. His first wife, the accomplished Bertha Arndts, issued an edition of the sonnets of Vittoria Colonna with a German translation. After her death, he married the widow of Guido Görres.

THE death is announced, on the 13th inst., at the early age of 41, of M. Camille de la Berge, an official in the cabinet of medals of the National Library. He was the author of a Memoir on the Roman Fleet, and had printed two theses, one in Latin on Byzantium, and one in French on the Reign of Trajan. He was also a contributor to the *Revue Critique* and the *Revue Historique*.

A VERY singular person has lately died in Norway, in his 83rd year, Anders Eivindson Vang, a peasant who exhibited remarkable literary gifts, and who did not a little to assist the study of comparative mythology. He began life as a servant, and never rose beyond a humble office in the village school, but he published several very important collections of folk-music and folk-songs, the most curious of which appeared in 1850. In 1870 he brought out his autobiography, and in 1871 a remarkable volume of local legends. He lived entirely among the people, and supported himself partly by teaching, partly by breaking stones.

NOTES OF TRAVEL.

As giving evidence of the continuance of the interest in African exploration awakened in Belgium two years ago by the Conference held at Brussels, we may note the appearance of a little work by M. Emile de Laveleye entitled *L'Afrique Centrale* (Brussels: Muquardt). In a more popular way it goes over the subjects taken up in M. Banning's larger work issued last year by the same publishers: the objects of the Brussels Conference, the leading points of African geography and recent discovery, the slave trade, and the commercial importance of the continent. A sketch of the growth of Egyptian power in the Nile Valley and translations of some of Mr. Stanley's recent letters are appended.

THE latest part of Guido Cora's *Cosmos* has for its leading paper a hydrographic sketch of Lake Titicaca, based chiefly on the researches of Agassiz and Garman, Thompson and Pentland. Two interesting letters from Count Savorgnan de Brazza, from Adume on the Ogowé, bearing dates April and June, 1877, also appear.

MR. L. G. SÉGUIN'S *Walks in Algiers and its Surroundings* (Daldy, Isbister, and Co.) is certainly the fullest handbook for the use of travellers to this favourite winter resort that has yet appeared in English. Murray's *Guide* and M. Picot's *Itinéraire* deal with the large area of the whole country; this book is devoted to the

capital and its immediate vicinity. After some chapters on Algiers as a winter residence, in which the advantages and disadvantages of its climate are very fairly stated, on the way thither, and on the cost of living, Mr. Séguin gives a very interesting account of the native inhabitants of the city, and of its history up to the time of the French occupation and the Kabyle insurrection of 1871. From these he passes, in the latter part of the book, to descriptions of the city itself, and the points of interest which lie within easy reach of it all round. Besides his acquaintance gained by residence, the author has evidently made a very careful study of the literature of his subject—French, Spanish, and English—and his well-written book will doubtless find a much larger circle of readers than those who can take it with them as a guide. Two maps and a number of pretty woodcuts illustrate the work.

IN concluding a letter, published in the current number of the *Church Missionary Record*, Lieut. Shergold Smith, of the Nyanza Mission, refers to the great advantages offered by the Masai route from the coast to Lake Victoria, which we believe will not improbably be explored during the present year under the auspices of the African Exploration Fund Committee:—

"One of Songoro's men here," he writes, "has traversed the Masai country twice. Eight years ago he did the distance from the borders of the Waruri's country to Tanga (south of Mombasa on the east coast) in twenty-four days, but says it has been done in fifteen. What a gain, could this route be made available! The chief difficulty is the hatred of the Masai to any stranger, white, black, or Arab colour Perhaps a traveller taking only a small escort, and but few stores to tempt the cupidity of the natives, could, by making sufficiently long stays at each village, dissipate the dislike and antagonism which result from ignorance and superstition. To pass hastily through would, I believe, be attended with much danger, for the native everywhere says 'If you were my friend you would stay with me, and not be so anxious to get away.'"

Dr. Kirk, H.M.'s Consul-General at Zanzibar, who lately went up the coast to Pangani, &c., gives it as his opinion that the route from Mombasa, or Tanga, is one of the most interesting as yet unexplored, but that to attempt it with any prospect of success, the traveller must first of all make himself acquainted with the Masai language.

MESSERS. HARTLEBEN, of Vienna, Pesth, and Leipzig, have commenced the issue in parts of a work by Dr. Josef Chavanne, entitled *Die Sahara: oder, Von Oase zu Oase*, being pictures of nature and life in the Great Desert of Africa.

MESSERS. BAILLIÈRE, of Paris, have just published a volume by M. Ph. Parlatore, entitled *Etudes sur la Géographie Botanique de l'Italie*.

A GEOGRAPHICAL Society has just been established at Metz, at the first meeting of which an inaugural address was delivered by Dr. Gerhard Rohlf, the well-known African traveller.

THE Société des Etudes Japonaises, Chinoises, Tartares, Indo-Chinoises, et Océaniques, which forms one of the sections of the Institution Ethnographique at Paris, have newly issued a brief *résumé* of their proceedings in 1875-7. Among the contents will be found a paper on the notation of Japanese proper names by Imamura Warau, and some remarks by M. Ars. Mouqueron on the Boughi or Woughi language, which he describes as the "lingua franca de tout l'archipel d'Asie."

THE "RASSEGNA SETTIMANALE."

La Rassegna Settimanale, which has appeared at Florence since the beginning of the year, seems destined to exercise a considerable influence on the Italian press. It is perhaps the first attempt made in Italy to assert liberal principles in political as well as social questions, without favouring the

ends of any one party; the first attempt to form an independent judgment in art and literature, uninfluenced by the *cliques* which are ever ready to sacrifice scientific to personal interests.

Sidney Sonnino and Leopoldo Franchetti, the founders of the new periodical, sufficiently attested their unprejudiced and independent point of view in their early writings. Sonnino's treatise on the *Mezzeria in Toscana* (first published in Hillebrand's *Italia*), and Franchetti's book on the *Condizioni economiche ed amministrative delle Provincie Napoletane*, formed an important beginning in the pursuit of studies on political economy, based on practical experience and exhaustive observations instead of the hypotheses on which they were formerly based in Italy.

As Sonnino prepared himself by many years of familiar acquaintance with the state of the peasantry in Tuscany, and Franchetti by his extended travels in the southern provinces, they undertook also an exploration of Sicily before publishing their principal work, *La Sicilia in 1876* ("I Contadini in Sicilia," by Sonnino; "Le Condizioni economiche e amministrative," by Franchetti): the most important attempt hitherto made to solve an exceedingly difficult social problem.

Among the articles on social questions which take a prominent part in the *Rassegna*, several deserve to be specially noticed. For we do not remember to have seen questions like those of the "opere pie" and their very imperfect management, of the Municipality of Florence, of the state of the poor at Naples, treated so fairly and openly and with such clearness and impartiality in Italy. Not less excellent is the political part: articles on the religious question, on foreign politics, and on the administration of the interior.

As for its literary and philosophical department the new periodical has much talent at its disposal. And as it is significant from a political point of view that the contributors of the *Rassegna* are utterly uninfluenced by the Camarilla and the parliamentary cliques of Rome, from a literary point of view the circumstance that it is published in Florence is still more significant. For in literature, art, and science, the old city of the Medici still remains the intellectual capital of Italy. The Istituto di Studi Superiori, the Scuola delle Scienze Sociali, the Accademia delle Belle Arti possess many prominent members; and the Vieux-seux Reading Room, with its library, the Circolo Filologico, and other foundations form an important centre for the literary elements of the place.

Among the articles of general interest which have appeared in the columns of the *Rassegna*, we may call attention to the following:—Comparetti on Zeller's *Reden und Aufsätze*; Hillebrand on Herder; Barzellotti on Schopenhauer. Not less valuable are the poetical contributions, among which some of Giosuè Carducci may be specially noticed.

NEW FACTS ABOUT MOLIÈRE.

THERE seems to be no end to the snatches of information about Molière which diligent investigators bring to light. M. Benjamin Fillon, author of *Molière dans l'Ouest de la France*, has just published a very interesting article, nominally on the coat of arms of the comedian, in the *Gazette des Beaux-Arts*. Molière's device is sufficiently well known—a comic mask, instead of a helmet, presides over a shield in which are three mirrors of truth. The shield and mask occur in the portrait of Molière—an engraving of Nolin's after Mignard, and touched up by Edelinck—which Charles Perrault printed in his *Hommes Illustres* (1696-1700, Iconographie Moliéresque, No. 46). M. Poulet-Malassis reproduced the scutcheon in his *Molière jugé par ses Contemporains* (Paris, 1877). M. Fillon shows that Molière's daughter, Madame de Montalant, used the same device. He also prints, from Gabriel Quinot's edition of 1666

—a very rare book—the monkey-supporters of the shield, as drawn by Molière's friend Chauveau. It will be remembered that Donneau de Visé alludes to these devices in his burlesque oration on the death of Molière (*Mercur Galant*, T. 4, 1673); while, on the authority of a private letter (1706), we know that Molière had the comic mask engraved on his plate. The silver was valued at 6,240 livres, but is probably long ago melted down.

So much for the blazon. It is much more important to learn that the engraving used, in its fifth state, by Perrault, is taken from an original by Mignard, which was probably painted in 1665–1666. M. Fillon gives a woodcut of the portrait; the face is wasted, wrinkled, and weary, as if from recent sickness. Now we know that Molière's consumption probably took hold of him in 1665. M. Fillon prints a fragment from a MS. book of verses, in which there occurs an epigram of Martial's (x. 58) "accommodé pour le Sieur Molière, quand il pensa mourir l'an 1665." A yet more curious collection of MSS., found near Tours in 1877, yields a letter from Thierry, the Paris bookseller, to a country customer. The letter is dated January 6, 1686, fourteen years after Molière's death. It speaks of a projected edition and biography of Molière, previously unheard of, which the censorship did not allow to be published:—

"Vous ne pouvez être satisfait pour les œuvres de Molière, en deux tomes, en folio, qu'avaient entrepris les associés. Il n'y a eu d'imprimé que la préface, et la vie de l'auteur, après quoy, les espreuves envoyées à l'approbation, il y a esté si fortement retranché, que M. Boileau et autres amys dudit auteur defunt qui y ont travaillé n'ont voulu entendre à continuer."

There were also difficulties about the privilege. These proof-sheets may possibly still exist, the blue rose of bibliography. Boileau had no patience with Grimarest's *Life of Molière*. If only M. Fillon or some other enthusiast could find these proof-sheets—Thierry's customer was to see them if he liked—not even Molière's own papers, which can be traced almost to the middle of the eighteenth century, would be a happier *trouvaille*. The minor discoveries noted by M. Fillon are, at least, encouraging. It is sad that the devotees, who could do so little against the author of *Tartuffe* in his lifetime, should have succeeded so cleverly in destroying the one authentic record of that life, the biography of Boileau. A. LANG.

MAGAZINES AND REVIEWS.

THE *North American Review* seems to have no difficulty in keeping its position at the head of the periodical literature of the United States. The present number has two or three important political articles—evidence, if such were wanting, that no less grave anxieties are weighing upon the mind of the New World than upon that of the Old; it has also another of General Richard Taylor's most racily written, but (we believe) inaccurate, papers on the War of Secession; it has the usual instalment of Protestant controversy; it has an interesting, but too apologetic account, from the pen of Rabbi Gottheil, of the position of the Jews in America; and it has Dr. O. W. Eliot's careful and suggestive comparison of American and English Universities. Unlike Prof. Helmholtz, Dr. Eliot is not content with reminiscences of a long-distant visit to Oxford and Cambridge, or with oral information of recent changes; and except for a few small details, and for what we think to be an underrating of the position of the Professors, we are obliged to accept all his statements of fact as true. Dr. Eliot is at one with those who attack the overshadowing examination system, and with those who wish to recall the Professoriate to its ancient and natural position. With regard to the sinecure endowments, he says that "it is extremely difficult for a foreigner, and especially for an American who is unfamiliar with sinecures, to enter fully into the English view of a

scholarship or a fellowship, or, indeed, to speak with patience of what seems a gross perversion of charitable endowments. . . . It is greatly to the credit of human nature that the English system of fellowships should have done as much good as it has; one would have imagined that it could do nothing but harm."

He regrets the abandonment by the English universities of "the great field of professional education," and notes with pleasure that the American practice is distinctly setting in the opposite direction. He regards the Oxford and Cambridge "local examinations" as beyond the scope of a university, and as only provisional undertakings, conducted by the universities until the State shall take them over. The "Schools examinations for certificates," on the other hand, he thinks within the proper scope of university activity, since the examinations are avowedly preparatory to university residence. His remarks about American universities do not so nearly concern us, but they will be read with interest. He shows how individual, and even empirical, most of them are, "sharing to the full the rawness of the country, and never for a moment free from the pressure of importunate needs." American universities, indeed, have in a great measure to do the work of secondary schools, and hence the length of residence required and the uniformity of the training given. It is a bad compliment, but, we fear, a well-deserved one, to Oxford and Cambridge, to remind them that "German universities had for fifty past, and are likely to have for many years to come, vastly more influence than the English upon American institutions."

The *Canadian Monthly* is seldom quite up to the level of the first-rate United States magazines, and the current number is not exceptionally good. There is, however, a lively article on Miss Martineau—a little late in the day, perhaps, and fiercely opposed to Abolition and Woman's Rights, and other causes which Miss Martineau supported, but still well-arranged, and not unsympathetic. There is a certain jauntiness in the article, common among a large class of men when discussing literary women, which makes against its effectiveness. Having regard to this article and certain other transatlantic writings of the month, one is tempted to parody a recent saying about the French:—"We know the Americans; a little more style would do them no harm," a little more *cultismo*, if the expression is allowed.

The *International Review* contains a pleasant, unambitious article by Madame Villari on "Learned Women of Bologna." The subject is not taken very seriously, and the paper does not profess to give new information, but the account of Laura Bassi, the famous woman professor at Bologna in the eighteenth century—she died as late as 1778—is extremely readable, and gives one a good idea of the enthusiastic, excitable temper of the Italian society about her which alone made her career possible. That lectures on "experimental physics" and the "Newtonian philosophy" should have been prepared and delivered habitually for years by the mother of twelve children, is certainly astonishing. Taking the twelve children into consideration, her life is more entirely extraordinary even than that of Maria Agnesi, her famous contemporary at Milan, of whom, we suppose, Madame Villari will have something to say in her next paper. Nor does her learning appear to have been exaggerated by her contemporaries. Otherwise she must have outlived her early reputation, seeing that she died at the age of sixty-seven. In middle life, however, the Senate of the University elected her to a new chair, and her lectures seem to have stood the test of time, and of the disappearance of the early circle of enthusiastic friends who had lifted her to fame as a girl of twenty. With that other paper fresh in one's mind, one asks oneself—how would Harriet Martineau have played the part of Professor at Bologna in the eighteenth century, or Laura Bassi that of journalist, publicist, economist, in London or in

Ambleside, in the nineteenth? Fortunately for her fame, Laura Bassi did not write an Autobiography.

OXFORD LETTER.

Queen's College, Oxford: March 18, 1878.

The Lent Term is generally an uneventful one, and the present Term has been no exception to the rule. The Commissioners have met in London; the Colleges have been anxiously engaged upon paper schemes of reform; and the University has determined to send out missionary lecturers into the highways of our large towns—this pretty nearly sums up all the main work of the Term. We have had no distinguished visitors from the Continent; a winter passage across the Channel seems to interfere even with the attractions of the Bodleian Library. To make up for the want of German Professors a lady, a novelist—in fact, Miss May Laffan, the authoress of *The Honourable Miss Ferrard*—has been working there, and collecting materials for a new novel on Irish life and character. In the Bodleian Library itself, however, a good deal of quiet work has been done. The new General Catalogue is now completely written out, with the exception of the article "Bible"—an article, doubtless, under which a good deal may yet have to be grouped. Prof. Ethé's Catalogue of the Persian MSS. has gone to press, and a MS. of Josephus has been sent to Prof. Niese, of Marburg, for a critical edition of the book which he has in preparation. Mr. Nutt, one of the sub-librarians, whose editions of Jehuda Chayyug and the fragments of a Samaritan Targum will be remembered, is about to publish a Hebrew commentary on Isaiah, by Rabbi Eliezer, of Beaugency, who flourished about 1250. The commentary is contained in a unique MS. now in the Bodleian. Dr. Neubauer, the other sub-librarian, has already safely seen his recent discovery, the Chaldee text of the book of Tobit, through the press, and the work may be expected towards Easter. The Chaldee text will be accompanied by rabbinical texts, translations, and an Introduction dealing very fully with the literary history of this curious book. Another work of considerable interest will shortly be issued from the Clarendon Press. This will be a collection of Provençal texts made by Mr. Armitage, of Worcester College, from MSS. in the Bodleian, the British Museum, and the Paris Library. The Icelandic Reading-Book prepared by Dr. Vigfússon and Mr. York Powell, of which I spoke in my last letter, is quite ready so far as the authors are concerned, though a delay has occurred in getting it sent to press. Prof. Fowler's edition of the *Novum Organum*, too, will be out at the beginning of next term. Meanwhile Prof. Max Müller's great work is progressing fast, and we may hope that it will not be long before the first instalment of the *Sacred Books of the World* is ready for the public. One of the contributors has already practically completed his share of the work. As for the find of an early MS. containing part of Robert of Gloucester's *Chronicle* in the binding of an old book belonging to the library of Corpus Christi College, I am absolved from describing the discovery, as it has been previously recorded in the ACADEMY. I may add, however, that the MS. has been now mended and properly bound.

Nor again need I allude to the loss we have sustained in Dr. Mozley's death, to the appointment of his successor, as well as of a new Professor of Moral Philosophy, or to the approaching vacancy of the chairs of Latin and Jurisprudence, since all these things have been duly recorded elsewhere. The retirement of Sir Henry Maine from the chair of jurisprudence is a serious misfortune, since it will be very difficult to find a successor. Indeed, it could be wished that the electors did not feel themselves obliged to fill it up immediately.

This leads me to a matter which has been much ventilated by those who busy themselves with the interests of the University as a seat of learning

and research. The harvest of science is great, but the labourers are few, and it may frequently happen that a competent representative of some particular branch of study cannot be found. Hence it has been proposed to establish life-professorships; professorships, that is, which are not to be filled up except when some eminent scholar happens to be in the field. What we want are not chairs, but men. The money which would accumulate during the vacancy of a chair, would go towards a fund out of which new chairs could be established whenever the right man happened to be found. The same fund might be applied to the foundation of temporary chairs. There are some kinds of professorial work which ought to be done once for all, by competent hands, but might be done in a limited space of time. Of course, there are certain subjects connected with the education of the place, for which a suitable supply of fitting representatives would always be forthcoming; we have no reason to think, for instance, that the spread of the examination-system, even at its present rate of progress, will ever succeed in destroying the continuity of the chairs of Greek or Latin. But there are many less favoured subjects, quite as important in themselves as Greek or Latin, in which the demand may easily exceed the supply.

Whatever be done in these cases, however, it is important that the Professors should no longer be allowed to shiver in the cold outside the colleges, since the colleges now practically constitute the university. It ought not to be left to the whims or narrowmindedness of a majority of young fellows to decide whether or not a wholesome professorial element is to be introduced into their body. Until the Professors are attached to the governing body of every college, with their larger experience and wider knowledge and sympathies, it is useless to expect that cordial co-operation between university and college work and teaching which is necessary for the new life of Oxford. Some counterpoise is needed for the growing absolutism of young men, fresh from the study of crambooks, and protected from the sense of responsibility by the *esprit de corps* of the society to which they belong.

The mischiefs such an absolutism is likely to bring about are not to be removed by enlarging the society. The present passion for bricks and mortar, for turning colleges into overgrown boarding-schools, and measuring their prosperity by the roll-call, is much to be deprecated. We have quite enough large colleges; the quiet but thorough work and education so much needed now-a-days can best be done where the number of students is at once small and select. And what is good for the taught is equally good for the teachers. Sophistry is the prevailing sin of the university; and the sophist is the product of a system which requires a lecturer to discourse on all that variety of topics, each of them sufficient to employ a lifetime, which a college with few instructors and many aspiring examinees is bound to provide for. No doubt college tutors must live, especially if they have wives and children and *bric-à-brac*; but, instead of telling them to increase their incomes by multiplying the men they have to cram, it would be better to devote a certain portion of the college revenues to enabling them to do their work thoroughly and well. Of course the proper maintenance of the non-resident fellows then becomes a difficulty, and the non-resident fellows, we are told, are the apostles of light and Liberalism in the midst of an unbelieving and Turcophil world. It is very unfortunate, certainly; but perhaps Liberalism will yet find means to support its apostles without appropriating the funds which were left by wise and good men of old for the support of "religion, learning, and education."

CORRESPONDENCE.

WAS THE AUTHOR OF THE EPISTLE OF JAMES ACQUAINTED WITH THE APOCALYPSE?

London: March 16, 1878.

It is perhaps a little surprising that somewhat greater attention has not been given to the close correspondence between James i. 12, and Apoc. ii. 10.* Not only is there precise identity in the expression *τὸν στέφανον τῆς ζωῆς*, an expression found nowhere else, either in the Old or New Testament, but the more detailed representation of the Apocalypse as to the trial and approved fidelity of the Church at Smyrna has its counterpart in the generalised *ὑπομένει πειρασμόν* and *δόκιμος γενόμενος* of James. The question thus becomes an interesting one whether the Epistle of James presents any additional evidence that its author was acquainted with the Apocalypse; for this is, I think, the more credible hypothesis, if the passages cited were not of independent origin. As such additional evidence, I would ask the attention of New Testament students to the section of the Epistle iv., 13-v., 6, where, as it seems to me, it is pretty clear that the author has before him the prophecy of the sudden and unexpected destruction of Babylon (Apoc. xviii.), though James modifies, re-moulds, and generalises, so that the imagery and language may better suit the persons and circumstances he has in view. The traders of James, proposing traffic (*ἐμπορεύσμεθα*), heedless of the fate awaiting them on the morrow, answer very well to the Apocalyptic *ἐμποροὶ* (xviii., 11, 15) who stand amazed and dismayed when, in a single hour, the source of their gains is cut off. And the expression *τῇδε τὴν πόλιν*, which has somewhat puzzled the commentators, finds a more ready explanation, if the author has before his mental vision the Apocalyptic city, "Babylon the great." So, too, with the Apocalyptic prophecy before us,

* Zeller brought this correspondence under notice in the *Zeitschrift für wissenschaftliche Theologie* for 1863, in an article which, however, I have been unable to consult.

we can understand why the rich men of James v., 1, are to "weep and howl" for the "miseries coming on;" and how they have been "gathering treasure in the last days," and living luxuriously and fattening themselves "in the day of slaughter." And, notwithstanding the modification of the Apocalyptic imagery, we may recognise in the wealth, the gold, and silver, and garments of the Epistle, the gold, and silver, and fine linen, and silk, and scarlet of the Apocalypse. The *φάραρα τὰς σάρκας ὑμῶν ἐς πῦρ* (James v., 3) is borrowed, apparently, from Apoc. xvii., 16. And it is worthy of note that the last verse in the section of James iv., 13-v., 6, which tells of the condemnation and murder of the unresisting just man, corresponds to the last verse of the prophecy against Babylon, which tells how "in her was found the blood of prophets and of saints, and of all that have been slain on the earth."

Other, though less cogent, evidence is found in the remarkable expression of James i., 17, "the Father of lights," which was suggested possibly by the theophany of Apoc. i., 12-16, where He whose hair is white as wool and as snow, and whose countenance is as the sun in its strength, has in his hand seven stars, and is surrounded by seven golden candlesticks. And in the next verse, James i., 18, there is probably an echo of Apoc. xiv., 4, 5. The word *κρίσμα*, employed by James, is, in the New Testament, a specially Apocalyptic word (v., 13; viii., 9), though found once elsewhere (1 Tim. iv., 4). Possibly also in *ἐκπετής πρὸ τῶν θυρῶν ἔσθρηξεν* of James v., 9, there is some reflection of Apoc. iii., 20.

On the whole, that James was acquainted with the Apocalypse is a position which seems to have in its favour stronger evidence than that adduced to show that he alludes in chap. ii. to the Epistles to the Romans and Galatians, and, as De Wette and others have thought, to the Epistle to the Hebrews (cf. James ii., 25; Heb. xi., 31). And it should be remembered that the author of the Apocalypse resembles James in occupying essentially a Judæo-Christian standing-point.

If the Neronian date of the Apocalypse is accepted, the Epistle of James must have been written a considerable time after Jerusalem had been made waste and desolate by the Roman armies, possibly about the end of the first century, a view which agrees very well with the address of the Epistle *ταῖς δώδεκα φυλαῖς ταῖς ἐν τῇ διασπορᾷ*. James is possibly a pseudonym, assumed, however, not for the purpose of forgery and deception, though rendering the Epistle somewhat more acceptable, on account of the dignified associations connected with that name in the early Jewish Church.

THOMAS TYLER.

THE OLD IRISH MISSAL AT OXFORD.

Villa Nova, Blackrock, Dublin.

The following particulars relative to the old Irish Missal in Corpus Christi College, Oxford, may prove interesting in addition to those already communicated to the ACADEMY (Nos. 293, 297) in the valuable articles of Mr. Warren and Mr. Bradshaw.

Through the liberality of the authorities of Corpus Christi College, and by the kind co-operation of the Rev. J. W. Nutt, of the Bodleian Library, I was enabled to make a careful examination of this Missal, in connexion with my labours on the *Facsimiles of National Manuscripts of Ireland*. The second part of this work will contain six pages of the Corpus Christi Missal, reproduced in colours by the photozincographic process.

Of the history of the Corpus Christi Missal nothing appears to be known. It was not included in the *Librorum Manuscriptorum Collegii Corporis Christi in Oxonia Catalogus*, published at Oxford in 1697. The first printed reference to it, so far as I am aware, would seem to be that of the Rev. H. O. Coxe, who at page 121 of his

Catalogus Codicum MSS. Collegii Corporis Christi, Oxon. (1852), describes it:—

"Codex membranaceus in 4^{to} minori, ff. 211, saec. forsan xi. exeuntis, in Hibernia, ut ex caractere conjectare liceat, exaratus. 1. Ordinarium missae, fol. 1. 2. Missa de S. Trinitate, fol. 7b. Missa de S. Maria; orationes pro defunctis, benedictiones, etc., fol. 12. Officium missae, orationes, lectiones, etc., ab Adventu per anni circulum, fol. 43."

The manuscript was next referred to by Prof. J. O. Westwood, chiefly in connexion with its artistic features, in his large and valuable work on the miniatures and ornaments of Anglo-Saxon and Irish MSS.

The volume is of small dimensions, being about six inches in length, by five in width, but of great thickness in proportion to its height, owing to the solid character of the vellum upon which it is written. All of the first portion of it has unfortunately disappeared, and it now opens with that part of the Mass called the Canon, but age and attrition have rendered this initial page nearly illegible. The Missal consists at present of 211 leaves, written in contracted Latin, in large and heavy angular Irish characters, somewhat resembling those in the text of the fragment of an old Hiberno-Latin Hymnarium which has long been in the possession of the Franciscans of the Irish Province. Almost every page of the Missal contains coloured initial letters, and throughout the volume we find fantastic representations of grotesque-looking animals, extremely attenuated, and generally coloured with purple patches on a red ground, with elongated yellow tongues, tails, and top-knots. In addition to these the MS. contains many coloured initial letters, of very large proportions, extending from the top to the bottom of the page. The larger letters are mostly composed of interlacings in combination with lacertine animals, and are executed in a style similar to that of some of the ornamentation on the carved stone at Olonmacnoise.

The present contents of the volume are as follows:—

Commencement of Canon of Mass. Ff. 1-7 a.
Missa de S. Trinitate. 7 b.

Collects and Secreta for the following Masses:—

De Sancta Maria. 12 a.
De Sancta Maria ab Adventu Domini. 13 b.
De Sancta Maria a Natiuitate usque ad Purificationem. 14 a.
De Resurrectione. 14 b.
De Petro et Paulo. 15 a.
De Sanctis presentis ecclesie. 15 b.
Pro Episcopo. 16 a.
Pro Rege. 16 b.
Pro Pace. 16 b.
In .xl. pro Pace in loco. 17 b.
Pro iter agentibus. 17 b.

The final lines of the last page (211 b) are as follows:—

"Cum anima sit in exitu sui dissolutione corporis uisa fuerit laborare tunc omnes fratres cum summa uelocitate occurrant canendo moderata uoce: Credo in unum deum. Cum uero illuc peruenerint contententur. psalmos penitentiales sine gloria sed subiungant hoc capitulum—"

The prayers for the festival of St. Patrick are as follows:—

"Oratio: Deus qui sanctum patricium scotorum apostolum tua providentia elegisti ut hibernenses gentes in tenebris et in errore gentilitatis errantes ad uerum lumen dei scientie reduceret et per lauacrum regenerationis filios excelsi dei efficeret tribue nobis quesumus eius piis intercessionibus ut ad ea que recta sunt quantocius festinemus. per. Secreta: Hostias tibi quas in honorem sancti patricii offerimus deuotas accipias ut nos a timore iudicii liberemur. per. Post communionem: Omnipotentem dominum uniuersitatis auctorem suppliciter exoramus ut qui spirituale sacrificium in honorem sancti patricii offerimus fiat nobis remedium sempiternum. per."

The preceding collect nearly corresponds with one for St. Patrick's festival in an ancient Armagh

Breviary. The allusion in the post-communion prayer to the judgment-day is probably based on a passage in the Gaelic hymn ascribed to Fiacc, the language of which, according to Zeuss, is very ancient. In this composition the angel, Victor, is represented as consoling Saint Patrick in his last moments with an assurance that, on the day of doom, the men of Erin would stand around him before the judgment-seat of God.

The following are the Collect, Secret and Post-Communion for the Mass of St. Brigit, Patroness and chief Abbess of Ireland:—

"Oratio: Celorum atque terrarum conditor et gubernator omnipotens deus peccanti populo succurre tua pietate et per antiq. . . in honorem sancte brigide presentem diei . . . gerimus sollemnitatem per ipsius suffragia perhenni misericordia tua potiamur. per. Secretum: Ecclesie tue quesumus domine preces et hostias beate brigide commendat oratio ut qui per illius . . . tis maiestatem tuam indefessa atque exorabilem humiliter imploramus cuius precibus adiuti misericordiam tuam sentiamus. per. Post communionem: Adiuuent nos quesumus domine hec misteria sancta que sumpsimus et beate uirginis brigite intercessio ueneranda. per."

In the Litany are included the names of the Irish Saints, Patrick, Brigit, Columba, Brendan, Finnian, Ciaran, and Furseus. It is noticeable that this Litany makes no mention of several Saints of Ireland who are invoked in the ancient Irish Missal formerly preserved at Stowe, such as Comgal, Canice, Finbar, Ruadhan, Kevin, Mochonna, Ita, and others.

In the narrative of the Passion according to St. Matthew, for Palm Sunday, the respective parts to be chanted by the different singers are indicated by small red letters placed over the initial words.

The most peculiar portions of the Missal are perhaps the following invocations in the Litany for Easter-eve, praying that God may preserve the King of the Irish and his army, and grant them life, health, and victory:

"Ut regem hibernensium et exercitum eius conseruare digneris:

"Ut eis uitam et sanitatem atque uictoriam dones."

No similar prayer, so far as hitherto known, has been found in any other Irish ritual. The king here alluded to may have been either Muircherthach Mac Lochlainn, Torlogh O'Connor, or his son Roderick, all of whom flourished towards the middle of the twelfth century. The words "Regem Hibernensium" would seem to indicate that this service-book was not intended for a special locality, or for any of the provincial or minor kings. The latter, in the opening lines of their Latin diplomas, inserted after their names those of the districts over which they ruled. The monarch of all Ireland, on the other hand, styled himself in the initial clauses of his charters "Rex Hiberniae," or "Rex totius Hiberniae." In an inscription on an elegant metal cross, still extant, made for Torlogh O'Connor, monarch of Ireland, he is designated in Gaelic, "*Righ Erend*," or King of Erin.

It is somewhat remarkable that this Missal, which is all in Latin, should have been written in the Irish characters; more especially as we now have evidence that the style termed, in French, "*diplomatique minuscule*" was in use among the native Irish in the middle of the twelfth century. I have recently been fortunate enough to bring this fact to light through the discovery of some important Hiberno-Latin documents of that class, hitherto unknown to palaeographers or historic investigators.

The Missal is bound in strong wooden covers, and with it is preserved an ancient leather satchel ornamented with impressed lines and circles. It appears to have been the usage of old in Ireland to keep books in satchels, which were called in Irish *polaire* or *tiagha lebar*, and of these some curious specimens in leather are still extant.

The custom of ecclesiastics in Ireland carrying service-books in satchels, or *perulæ*, is mentioned incidentally by Cambrensis. In his account of the

interview, which he styles *stupenda confabulatio*, said to have occurred about 1182 A.D., between an Ulster priest and a man-wolf with his dying female companion, in a wood on the borders of Meath, he writes as follows:—

"... [Lupa] supplicavit ut viatici largitione beneficium consummaret. Quo sacerdos cum se carere firmiter asseruisset, lupus qui parumper abscesserat iterum accessit, ostendens ei perulam, librum manuum et aliquot hostias consecratas continentem; quae more patriae presbyter itinerans a collo suspensa deferbat. Tandem sacerdos... terrore tamen magis quam ratione compulsus, communicavit."

Had the Corpus Christi manuscript been held in special veneration—from its having been connected, for instance, with any pre-eminent Saint—its custodians would have probably had it enshrined in an ornamented metal casket, similar to that of the old Irish Missal formerly at Stowe, or that of the ancient Psalter styled the "Cathach," described in the Introduction to my work on the *Facsimiles of the National Manuscripts of Ireland*, and in the Fourth Report of the Royal Commission on Historical Manuscripts, 1874.

In addition to the Stowe Missal, in England, there are two old Irish Missals extant in Scotland. The first of these is known as the "Drummond Missal," from its having been preserved at Drummond Castle, in Perthshire. An edition of it was nearly completed by the late Rev. G. A. Forbes, of Burnt Island, and it will, I trust, before long be issued by the Rev. Walter Bell. The other, now preserved at Edinburgh, was formerly attributed erroneously to St. Columbanus. It is now more appropriately designated the "Rosslyn Missal," from having been for some time in the possession of the Sinclairs of Rosslyn, in Scotland.

The "Drummond Missal" contains a Mass for "the King" different from that in the Corpus Christi MS., the Mass "Pro Rege" in which corresponds substantially with that in the present Roman Missal. The prayers for the festivals of St. Patrick and St. Brigit, and the Litanies, are not to be found in the "Drummond Missal." A Collect for St. Patrick, similar to that in the Corpus Christi Missal, is contained in the Rosslyn MS. The "Drummond" Missal contains a calendar, the absence of which from the Corpus Christi and Rosslyn Missals is so much to be regretted. In examining the liturgical details of these MSS., some valuable illustrations may be derived from tractates, in the old Irish language, on the Mass and its ceremonies, which were transcribed in the fourteenth century into a MS. at present in Dublin, styled *Leabhar mór Duna Doighré*, otherwise known as *Leabhar Breac*, which is now accessible in its entirety in a recently-published lithographic facsimile.

JOHN T. GILBERT.

FRENCH LAW.

Boisviperé: March 15, 1878.

I did not reply to Mr. Saintsbury's letter at once because I waited for an opportunity to consult an experienced French lawyer. When he understood the case he only laughed, and said, "Mais votre critique anglaise n'est pas bien fort; il vous a cherché là une mauvaise chicane." The error is merely technical. If the jury formally returned a verdict of extenuating circumstances, then some punishment would be applied; but in such a case it would probably be a minimum. The jury, however, in consideration of extenuating circumstances—such as the facts that the woman was a mere instrument in her husband's hands and shrank from denouncing him, and that by her care she saved the life of the victim—would probably return a verdict of "non coupable," which is simply an acquittal. I intended to convey that the woman was acquitted in consequence of the above considerations, and not because she was innocent in the sense of having had nothing to do with the matter. I

quite admit that there was a technical error in the expression I used, but that is all.

Not satisfied with one opinion, I consulted another lawyer, who also laughed and used a phrase which I beg pardon for reproducing exactly. He said, "Votre critique anglaise cherche des poux dans la paille." The woman in such a case, he said, would most probably escape punishment from a consideration of the circumstances, which was what I intended to express. Supposing, he said, that "extenuating circumstances" were the verdict formally returned, the punishment would be very slight for a woman acting as Migeon's wife had acted in the story.

Both lawyers declared that it would never have occurred to a French critic to *chercher chicane* about so trifling a matter, and one of them affirmed that he had never seen a French play, in which legal matters were introduced at all, which did not contain far wider deviations from the strict letter of the law. The acquittal of Migeon's wife, in consideration of the circumstances, was, they say, exactly what would have taken place had the case been a real one.

Mr. Saintsbury himself admits that the testamentary arrangements in my book are possible. I will not allude to the other contents of his letter farther than to say that the declining intellect of the Archbishop seems to me preferable to the sharpness of Gil Blas.

THE AUTHOR OF *Marmorne*.

London: March 19, 1878.

I should have no comment to make on the above letter if I did not think it as well that the dust of French lawyers, straw, unsavoury insects, &c., which Mr. Segrave raises to cover his retreat should not be allowed to obscure the real point at issue. I may therefore be permitted to remind your readers that my sole allusion to legal matters was a casual statement that the author of *Marmorne* "did not seem very much at home in French law." Mr. Segrave confesses to a technical error in French law. Now a man does not usually make a technical error in a subject in which he is very much at home. My remark, therefore, is fully justified.

GEORGE SAINTSBURY.

"AMHIAOI.

St. John's College, Oxford: March 16, 1878.

A unique Greek MS., temporarily in my possession, written A.D. 1214, and containing an account of a monastery founded by Neophytus in Cyprus a few years before, gives a list of the books in the Library at that date. Among them are—

(a) ἑτερον δωδεκάλογον τὸ πρόχειρον τοῦ ἐγκλείστου, ἐν ᾧ τεσσαρακονταετίας, καὶ πεντηκονταετίας, καὶ φυσιολογίας ἀναφορά.

(β) ἄλλο πάλιν τὸ καλούμενον τελεταῖον (f. 29 b.).

Neophytus thus describes the commencement of his own education when he became a monk at the age of eighteen:—

τὰς ἐν ταῖς σούταις καλουμένας ἀμπέλους καλλιέργειν ἐπέτράπη· καὶ πέντε χρόνους ἐν αὐταῖς διακονίσας καὶ τὰ πρῶτα τῶν γραμμάτων στοιχεῖα γνωρίσας, κ.τ.λ. (f. 12 b.).

Can any of your readers throw light on these passages? Is ἀμπέλοι a local name for "pot-hooks" or for letters elaborately flourished like the tendrils of a vine? F. E. WARREN.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, March 25.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.
5 P.M. London Institution: "The Old Age of a Planet," by R. A. Proctor.
7 P.M. Actuaries: "Principles to be observed in the Valuation of Life-Assurance Companies," by A. H. Bailey.
8 P.M. Society of Arts (Cantor Lecture): "Application of Photography to the Production of Printing Surfaces and Pictures in Pigment," by T. Bolas.
8.30 P.M. Geographical: "On Lake Nyassa and my Journey from its Northern End, via Ugogo, to Zanzibar," by H. B. Cotterill.

TUESDAY, March 26.—8 P.M. Anthropological Institute: "On the Original Range of the Papuan Race," by F. A. Allen; "On some Ancient Rock Paintings in New Zealand," by Dr. J. von Haast.

8 P.M. Civil Engineers.
WEDNESDAY, March 27.—8 P.M. Literature: "On the Literary Career of a Shakspeare-Forgery," by Dr. C. M. Ingleby.

8 P.M. Society of Arts: "State Aid to Music at Home and Abroad," by Alan S. Cole.

THURSDAY, March 28.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.

7 P.M. London Institution.

8 P.M. Society of Arts: "Electric Lighting," by Dr. Paget Higgs.

8.30 P.M. Royal. Antiquaries.

FRIDAY, March 29.—8 P.M. Society of Arts: "Depreciation of the Value of Silver," by Col. J. T. Smith.

9 P.M. Royal Institution: "On the Chemical Actions of Light and their Electrical Relations," by Prof. Dewar.

SATURDAY, March 30.—3 P.M. Royal Institution: "Natural History of the Ancients," by the Rev. W. Houghton.

3 P.M. Physical: "Byrne's Pneumatic Battery," by W. H. Proce.

8 P.M. Chemical: Anniversary.

SCIENCE.

A Treatise on Photography. By W. de Wiveleslie Abney, F.R.S. (London: Longmans & Co., 1878.)

It is strange that an art so recent as photography should not have an unclouded history, yet if the question were put "Who invented photography?" few would be able to answer satisfactorily. Some would mention Daguerre, and others refer to Fox Talbot, who died but the other day at Lacock Abbey; while the names of Sir John Herschel, Scott-Archer, or of those earlier investigators Scheele, Wedgwood, Davy, &c., might possibly be quoted. But if photography means the formation of an image in the *camera obscura*, and the recording of such image upon a sensitive plate, so that the picture may afterwards be taken out of the camera and put before a spectator, then it is none of the illustrious names above mentioned that can claim to be that of the first photographer, an honour which undoubtedly belongs to Joseph Nicéphore Niépce.

Few are aware of the fact that this French philosopher succeeded in securing a picture printed by light in the camera so early as 1816, and it is only within the past few years that the information has been before the world. M. Victor Fouque, a gentleman well known both in literary and scientific circles, has done good work in establishing this fact by letters and documents of unmis-takeable genuineness, and he is supported moreover by testimony on this side of the Channel, whither Nicéphore Niépce came in 1827. A view of Kew Church taken in that year (Nicéphore and his brother had lodgings in the neighbourhood) is in all probability the first photograph from nature taken in this country, a historical picture, we believe, still among the art treasures of our British Museum.

Nicéphore Niépce employed two mediums in the production of his camera pictures—salts of silver and bitumen of Judea. His pictures secured by the first-named were doubtless of a volatile nature, and did not remain visible, probably, for more than a few days or weeks. This fact, however, in no way detracts from the merit of their production, for the silver pictures of the present day are, as we know, far from permanent. Nicéphore's brother happened to be in England at the time the former, in his homely laboratory at Châlons-sur-Saône, finally succeeded in holding fast shadows depicted on

the wall of his camera, and the letter in which the taking of this the first camera picture is described to his brother is still extant. It is dated May 28, 1816, and Nicéphore enclosed in it the picture of a pigeon-house standing at the back of his laboratory. Naturally enough the shadows were reversed, and this is how the philosopher explains the photograph to his brother:—

"The pigeon-house is reversed on the picture, the barn, or rather the roof of the barn, being to the left instead of the right. The white mass, which you perceive to the right of the pigeon-house, and which appears somewhat confused, is the reflection upon the paper of the pear tree, which is some distance further off; and the black spot near the summit is an opening between the branches of the trees. The shadow on the right indicates the roof of the bakehouse, which appears somewhat lower than it ought to be, because the camera was placed about five feet above the floor. Finally, those white lines marked above the roof of the barn are the reflection on the film of the branches of some trees in the orchard."

This, then, in Nicéphore Niépce's own words, is the description of the first camera picture. Afterwards, as we have said, in 1824, he adopted bitumen of Judea as his sensitive medium, and by its means produced pictures which are more permanent than many produced to-day. In 1829, as we know, Niépce entered into partnership with Daguerre to perfect photography, and Daguerreotype was published to the world in 1839, two years after Nicéphore's death and contemporaneously with the photogenic process of Mr. Fox Talbot.

Since that time the art has made gigantic strides, and at the present day its applications are as various as they are numerous. To the astronomer and the physicist photography is alike valuable, and many of our recent solar discoveries are due entirely to the camera. In multiplying literary and art productions photography is no less useful, while as a truthful recorder of phenomena its aid is invaluable. Portrait and landscape photography have arrived at such a pitch of perfection that the higher class of such productions are admitted to be works of art, while the possibility of printing them in permanent pigments has added much to the importance of all such work.

Under these circumstances the advent of a thoroughly practical handbook like that of Captain Abney will be very welcome. During the past few years there has been much progress made in what may be termed the science of photography, and especially with regard to astronomical and spectroscopic photography, and Captain Abney is the one of all others in whom confidence may be placed to teach what is new in these matters. Collotype printing, Carbon printing, Phototype and Photo-engraving, names by which the new printing processes are called, are all comparatively novel phases in photography; and in respect to all these the author has his say, while, at the same time, he does not forget the beginner, who is strange to dipping-baths, developers, and fixing agents, and who wants to know first of all what is understood by such things as pyroxiline and collodion. Captain Abney's

Photography is one of the most useful of Messrs. Longmans' series of handbooks.

H. BADEN PRITCHARD.

Der Brief des Julius Africanus an Aristides.

Kritisch untersucht und hergestellt von Friedrich Spitta. (Halle: Waisenhaus, 1877.)

JULIUS AFRICANUS was a contemporary of Origen, and was one of the few of his contemporaries whom Origen did not entirely throw into the shade in learning. He was not only distinguished for learning, but had also considerable critical powers, and rejected the allegorical interpretations that were so much in fashion. His principal work was one upon chronology, of which only a few fragments have come down to us. Besides these, we have a letter to Origen on the history of Susanna (which Africanus called in question) entire, and also considerable fragments of a letter to Aristides on the discrepancies in the genealogies of St. Matthew and St. Luke.

These fragments have been very carefully edited by Herr Spitta in the monograph before us. The largest section is preserved by Eusebius in Book I. of his *Ecclesiastical History*. The rest are recovered from Catenas, in which they appear as extracts from another work of Eusebius, the *Quaestiones Evangelicae ad Stephanum et Mariscam*.

Hence Herr Spitta has had a double task—partly to piece together these various fragments, and partly to revise and edit the text of Eusebius.

There can be no question as to the thoroughness of these labours; the only question would be whether, in the first part at least, they were not perhaps too thorough—whether there was not perhaps an expenditure of ingenuity and acumen somewhat in excess of the data, and beyond the point at which it is possible to reach a quite profitable result. In dealing with reconstructions of this kind one is tempted to say, "It may be so, but the evidence does not quite warrant us in saying that it is so, or in building any further conclusion upon the assumption that it is." However, we should be sorry to pronounce a very definite opinion of any kind on this portion of Herr Spitta's work. It is somewhat intricate and difficult to follow, and requires the stimulus of a special interest in the reader which not very many will be found to possess.

It is otherwise with the second half of the book, which deals with the text of Eusebius. The general tenor of Africanus' remarks on the genealogies being known, it is not of so very much importance what belongs to them and what does not, and at what precise point an hiatus is to be assumed and what may be supposed to have been its extent. But the *History* of Eusebius is a work of quite unique value; it is one that every theologian reads, and the reconstruction of its text is a problem of great interest. It is clearly an advantage to have even a small portion of it discussed so thoroughly as it is by Herr Spitta.

Herr Spitta has been enabled to contribute a new element of great weight to the discussion in the shape of a Syriac version of Euseb. *Hist. Eccles.* i., 7., furnished to him by Prof. Wright, of Cambridge,

through the good offices of Professors de Lagarde and Zahn. This is taken from two Syriac MSS., one dated A.D. 462, at St. Petersburg, and the other of the sixth century, at London. The dates of these MSS. alone would be enough to show their great importance. Herr Spitta assigns to them a place second only to the other translation, that of Rufinus, which belongs to the very century in which Eusebius wrote.

The distinctive feature in Herr Spitta's work is the use he has made of these translations. In this we feel sure that he is upon the right track. Where it can be distinctly seen what reading the translator had before him, this must surely have a stronger attestation—dating as it does from less, or very little more, than a century after the book translated—than can be afforded by any of the Greek MSS., the earliest of which do not go back beyond the tenth century. No doubt it is often impossible to ascertain clearly what reading the translator had before him. Rufinus especially allowed himself great liberties. But the tendency among editors has been, we believe, to make too much rather than too little of these drawbacks. Even Heinichen hesitated to treat the Latin version as an independent authority, and only used it to confirm the evidence of the Greek MSS. Herr Spitta in the present treatise (about which the only thing that we regret is that it covers so little ground) has taken a more decided step in what we fully believe to be the right direction.

The readings that he seems to us to have corrected with the most conspicuous success are *πολυτρόπως* for *πολυπλόκως* in section 20 of his own text; and the omission of the two clauses in section 21. It also seems a happy suggestion that *βιβλος τῶν ἡμερῶν* is a translation of the Hebrew title for the Books of Chronicles. The more elaborate discussions of the difficult readings in sections 20, 24, 25, 27, 28, 29, all contain matter that deserves to be thoroughly well weighed, though perhaps in some cases no very certain conclusion can be arrived at.

We observe that Herr Spitta does not seem to treat the story about Herod's destruction of the Jewish genealogies as a serious blot upon the critical character of Africanus. Indeed, he unites to this the statement which Africanus professes to give as a tradition derived directly from the *Desposyni*, or relatives of our Lord. The rest of Africanus' statement as to the mode of reconciling the two genealogies by the assumption of levirate marriages he makes out to be a theory of that writer himself. There are some difficulties in the way of this, as it involves the excision of a *καὶ* in section 26 of the text, and compels us to take *ἐξήγησις*, in section 30, as equivalent to *ιστορία*; on the other hand, it seems to give a better explanation for *κατ' ἀνάληψιν*, in section 25, and also to give a better connexion to the argument as a whole. On the value of Africanus' solution from a harmonistic point of view Herr Spitta does not pronounce any positive opinion, but seems to regard it favourably. W. SANDAY.

SCIENCE NOTES.

ANTHROPOLOGY.

British Anthropology.—Since the publication of our last budget of Notes on Anthropology, the Anthropological Institute has issued a number of its Journal, which is marked by unusual merit. Without selecting any of the papers for special remark, we may fairly call attention to the Report of the Anthropometric Committee appointed by the British Association for the purpose of obtaining systematic measurements of the inhabitants of the British Isles. This Report has been drawn up by Major-General Lane Fox, and is accompanied by ten chromolithographs illustrating typical colours of human hair. The well-known volume of *Notes and Queries on Anthropology*, compiled a few years ago by another committee of the British Association, contained upwards of fifty colour-types for hair, skin, and eyes, copied from Dr. Broca's standard tables. It has been found, however, that observers usually experience some difficulty in making use of such small patches of colour as are given in that work, the discrepancies in the results of different observers being so marked as to render the returns almost valueless. In the present report, therefore, the number of patterns has been much reduced, while their size has been greatly increased. A small book containing ten coloured patterns, carefully matched with typical specimens of hair, has been issued, and it is to be hoped that the use of these patterns will lead to satisfactory results. We learn that the committee is perplexed by the difficulty of ascertaining, by means of photographs, the various types of physiognomy characteristic of different localities in Britain.

Anthropology at the Paris Exhibition.—It is now almost a year since the anthropologists of Paris had the satisfaction of learning that a ministerial decree dated March 29, 1877, had authorized the formation of an exhibition illustrating anthropological science, in connexion with the great general gathering which is so soon to be held. The organisation of the exhibition was entrusted to the Anthropological Society of Paris, who accordingly appointed a committee to carry out the work. This committee has met regularly every Wednesday, under the presidency of M. Quatrefages, and it is pleasing to learn that the applications which it has made through its secretary, M. G. De Mortillet, have been most generously responded to. An outline of the classification adopted by the committee has also appeared in these columns, and an interesting account of the details may be read in a recent number of M. Cartailhac's well-known *Matériaux*. In spite of political difficulties, and in the face of commercial depression, the exhibition promises to be highly successful, and it will probably represent the most important international movement which has ever been set on foot in favour of anthropology.

The Industrial Arts of the Papuans.—Almost the whole of the last number of the *Archivio per l'Antropologia* is from the pen of the active editor, Dr. Mantegazza. Attention was called in these columns, a few months ago, to the first part of his essay on the Papuans; and the number of the *Archivio* now before us contains the completion of this interesting paper. The present part is devoted to a discussion of the psychology of these people, as deduced from a study of their industrial arts, which may be assumed to reflect their state of culture. That Dr. Mantegazza's Museum at Florence is unusually rich in illustrations of Papuan ethnology is evident from the catalogue appended to this paper, a catalogue which comprises no fewer than 578 specimens. As many of these are duplicates, he is in a position to exchange with owners of other ethnological collections. It is impossible to enumerate the objects described and figured by Mantegazza, including, as they do, a great variety of weapons for war and for the chase, instruments for naviga-

tion and for fishing, dress and personal ornaments, objects of worship, stone implements, &c. The general character of Papuan industry is very much higher than that of the Australian or Tasmanian. One of the most interesting objects described, but not figured, in this paper is a group of figures in wood, closely resembling a specimen from New Zealand, and tempting a suggestion as to possible ethnic relations. Those who are exploring the ethnology of New Guinea will find a rare vein to work upon in Prof. Mantegazza's memoirs.

The Antiquity of Man in America.—American anthropologists have naturally taken a good deal of interest in Dr. Abbott's announcement of his discovery of stone implements in the State of New Jersey, under conditions which seem to point to their glacial age. The discoveries have been fully described in the last *Annual Report* of the Trustees of the Peabody Museum; and the subject has also been discussed by Mr. T. Belt, in an interesting paper contributed to the current number of the *Quarterly Journal of Science*. During a recent visit to New Jersey, Mr. Belt had an opportunity of examining the implement-bearing deposits under the guidance of Dr. Abbott. It is believed that the sands and gravels in which the specimens occur were formed on the retreat of the land-ice of the glacial period, and before the last submergence of the surface. Most of the implements are ruder in type than our palaeolithic flint weapons; and one abundant form has received the name of the "turtle-back" type. A solitary specimen has been obtained with markings very suggestive of glacial scratches; but doubt has been expressed as to whether this stone has really been fashioned by the hand of man. No conclusion, therefore, should be based upon this specimen, although Mr. Belt himself believes it to be worked. He renews an appeal for the thorough examination of the relation which the flint implement yielding deposits in this country bear to the glacial beds, especially at Hoxne, in Suffolk, where he believes it would be easy to settle the question as to the age of the implements, whether glacial or post-glacial.

Geographical Distribution of Lake Dwellings in Europe.—From the *Correspondenz-Blatt* of the German Anthropological Society, we are able to learn what passed at the last general meeting, which was held at Constance, under the presidency of Prof. Virchow. Assembled on the shore of a lake rich in the remains of pile-buildings, it was only natural that much of the opening address should be devoted to the consideration of these structures. Glancing at the relation of the pile-builders to the older cave-dwellers, Prof. Virchow enlarged on the enormous lapse of time which appeared to separate the one from the other, though many of the lake-dwellings are referred, like the caves, to the "Stone age." The Swiss pile-buildings may be brought into geographical relation with similar structures which have been discovered in Bavaria and Württemberg, and, again, in some of the lakes of Austria. All these are linked together by Virchow, and form his great *southern* group. But throughout Middle Germany these structures have not been found; nor, indeed, are there many lakes in which they could well have been built. In North Germany, however, we are able to trace another group, correlative with the southern, and stretching as far east as Livonia. Prof. Virchow described a lake-dwelling which he had lately visited in this extreme eastern limit. Further to the north, the pile-buildings again disappear; none being known throughout Denmark, Sweden, and Finland, though it is well known that their remains have been found in Ireland and even in Wales. With admirable caution Prof. Virchow argues against the inference that all pile-buildings are related in time, or that their inhabitants were connected by community of race; and he thus exposes the shallow dictum:—"Pfählbau ist Pfählbau; Pfählbauzeit ist Pfählbauzeit."

The Lake-Dwellings of Switzerland and other parts of Europe. By Dr. Ferdinand Keller. Translated and Arranged by John Edward Lee, F.S.A., &c. Second Edition, greatly enlarged. In Two Volumes. (Longmans.)—At a time when the Swiss lake-dwellings were but little known in this country, Mr. Lee, the well-known antiquary of Caerleon (now of Torquay), rendered admirable service to English archaeologists by putting before them an adapted translation of Dr. Keller's Reports to the Antiquarian Association of Zürich. More than ten years have passed since his volume appeared, and during this time our knowledge of the old lake-dwellers has been steadily growing. Remains of their curious habitations have indeed been found on the shores of all the shallow lakes of Switzerland, and similar relics have been brought to light in the lakes of other countries. Hence, when Mr. Lee was called upon for a new edition, he found it necessary to considerably enlarge his work. In fact, the text has now grown to nearly twice its original size, while the number of plates has been more than doubled. Dr. Keller has issued his Seventh Report to the Zürich antiquaries, and this, of course, had to be translated. Notices of pile-buildings have also been published by many other observers, in a great variety of publications and in various languages; and wherever these seemed to be of sufficient interest they have been collected and epitomised by the editor. In its present form, therefore, the work presents an almost complete record of what is known about lake-dwellings. Mr. Lee, by his industry and skill in this compilation, has earned the thanks of all archaeologists whose ken is sufficiently wide to stretch back into the prehistoric past.

BOTANY.

In the *Annales des Sciences Naturelles*, Tome iv., Nos. 5 and 6 (Botanique), will be found Prof. Van Tieghem's third *Memoir on the Mucorini*. This time he deals with *Pilobolus*, *Abidia*, *Rhizopus*, *Helicostylum*, *Thamnidium*, *Mortierella*, *Syncephalis*, &c., each of which receives a description in detail of its structure and life-history, illustrated by well-executed plates. The laws governing the formation of zygospores and asexual spores, and their modes of germinating, and the morphological differentiation of the mycelium, are treated of comparatively in the introductory part. The Memoir is preceded by two classifications of fungi, in the first of which the primary division is based on vegetative, and in the second, on reproductive characters. In the first classification the primary division is into *Chitomyces*, in which the thallus is tunicated and immobile (a mycelium), and *Gymnomycetes*, in which it is naked and mobile (a plasmodium). The *Chitomyces* are then subdivided into two groups of orders, according to their possession of sexual, or only non-sexual means of reproduction. The first, or sexual group, includes the *Monoblepharidaceae*, *Saprolegniaceae*, *Peronosporaceae*, *Biotomophthoraceae* and *Mucorini*; and the second, or non-sexual group, the *Uredineae* *Ustilagineae*, *Basidiomycetes*, and *Ascomycetes* (!). The *Gymnomycetes* are similarly divided. The first or sexual group includes the *Ancyliaceae*, *Zygochytiraceae*, and certain *Chytridiaceae* (such as *Polyphagus*); and the second or non-sexual is represented by the *Myxomycetes*. As to the primary division it can only be called awkward since it is very difficult to draw any line of division where the vegetative characters of fungi are involved; but such as it is it might be borne with for the sake of convenience, were the farther divisions on sexual grounds reasonable. It is true that no quite satisfactory account has yet been given of any sexual process occurring in the *Uredineae* or *Basidiomycetes*, and it is but right to exclude them from the sexual group. But there are very few botanists now outside the Paris school who will attempt to deny the existence of sexuality in the *Ascomycetes*. It will be said that there are subdivisions of the *Ascomycetes* in

which this has not yet been conclusively proved, but that would not affect the question of their inclusion from Van Tieghem's point of view, for we find afterwards that he includes "certain Chytridiaceae (Polyphagus)" in which sexuality has been proved to exist, and leaves out the others. We must assume then that M. Van Tieghem denies the existence of sexuality in any Ascomycete, and therefore also the accuracy of the researches of De Bary, Janczewsky, Stahl, and many others, including the most eminent mycologists, whose experiments and observations have been repeated and verified so often that there are now few who do not accept the results as most securely established facts. But the accuracy of these M. Van Tieghem denies, without stating here any grounds whatever for his denial, and we must suppose that he has nothing new to tell us in this relation. As to the exclusion of the *Myxomycetes* from the sexual group of the *Gymnomycetes* there is little to be said for or against it. There is no doubt that the phenomena of their life-history are such as to support views in favour of their sexuality, but, on the other hand, M. Van Tieghem would perhaps have been scarcely justified in placing them in the sexual group in the present state of our knowledge. A second classification is then given in which sexuality or non-sexuality is made the primary basis of classification. The first division, including all those orders in which sexuality is known (according to Van Tieghem's lights), is called *Oomycetes*, and the second or non-sexual division *Sporomycetes*. The vegetative characters govern the subdivision, and we ultimately come to the same special grouping of orders as in the first classification. Apart from M. Van Tieghem's notions as to the inclusion or exclusion of orders, the second system of classification must be called very reasonable, since there is no doubt that a classification of fungi in which the mode of reproduction is preferred to vegetative characters is, from the nature of the subjects, far more practicable.

In the *Naturforscher* (No. 5, 1878) Dr. Frisch gives an account of some experiments he has made on the action of low temperatures on Bacteria. He subjected putrefactive fluid Bacteria in decaying organic matter to 87°-5 (C.) and allowed the temperature to rise during two hours and a half to 0° with the result that the Bacteria grew rapidly when transferred to a nutritive fluid.

MR. WORTHINGTON SMITH figures and describes in the *Gardeners' Chronicle* (March 9) specimens of *Agaricus furfuraceus* which assumed the habit of *Morchella*. There is no doubt that these plants, which were first thought to be morels, are true specimens of *Agaricus furfuraceus*, for Mr. Smith mentions that many intermediate forms were found together. There have recently been found many specimens of *Agaricus* with the habit of other species, and they have generally been accounted for by the supposition of "protective resemblance," but unfortunately for this theory, most of the cases have been of poisonous species taking the habit of edible ones. In this case, as Mr. Smith points out, there would be little advantage to *Agaricus furfuraceus* in assuming the habit of the much sought after *Morchella*; there would certainly be as little to an unskilful collector.

MR. B. D. JACKSON has privately issued a facsimile reprint of Turner's *Libellus de re Herbaria Novus*, originally published in 1538. The reprint is very accurately and clearly executed, and a life of Turner, with his will, &c., and a list of his works, is given along with it. Mr. Jackson (30, Stockwell Road, S.W.) has still several copies to dispose of at the price of 10s. We understand that it is his intention to form a Turner Printing Club, with the object of re-issuing, in facsimile, with notes, early and very rare publications in Natural History. A small subscription (half-a-guinea) is proposed, but the project cannot be carried out unless wide support is secured.

In the *Botanische Zeitung* (Nos. 5 and 6, February) will be found a paper by Count Solms-Laubach, "Ueber monocotyle Embryonen mit scheitelbürtigem Vegetationspunkt," and in *Linnaea* (Band viii., Heft 1, 1878) there is a monograph of the *Pandanaeae* by the same author.

THE Prussian Government has bought the Herbarium of the late Alexander Braun for 21,000 marks, and the Italian Government has acquired the Cryptogamic Herbarium of De Notaris for the Botanic Garden of Rome.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, March 6.)

H. W. BATES, Esq., F.L.S., F.Z.S., President, in the Chair.—Mr. F. Moore, at the request of Sir W. H. Gregory, late Governor of Ceylon, exhibited a large series of drawings, executed by native artists, of the transformations of the Lepidoptera of that island. These drawings were made under the direction of Dr. Thwaites, and represented for the first time the life-history of many species.—Mr. McLachlan exhibited some entomological parts of the great Russian work, Fedtschenko's *Travels in Turkestan*.—Mr. H. Goss exhibited a small collection of fossil insects obtained by Mr. Gardner from the Bournemouth leaf-beds (Middle Eocene). The collection comprised numerous elytra of Coleoptera, wings of Neuroptera, &c.—Mr. J. Mansel Weale read some "Notes on South-African Insects." These referred to variation in *Pieris Severina* and *Pieris Maesetina*; on the secretion of formic acid in *Termes trivertius*, and the probable localisation of the same in a cephalic process, and also to the Larvae of some Hesperidae in relation to the subject of protective resemblance.—Mr. Edw. Saunders read a paper entitled "Remarks on the Hairs of some of our British Hymenoptera." From a microscopical examination the author found that the presence of branched or plumose hairs is characteristic of the Anthophila, while the hairs of the Fossorae, of Heterogyna, and the Diptera are all simple or in some cases twisted.—Mr. A. G. Butler communicated a paper on "The Natural Affinities of the Lepidopterous Family Aegeriidae." From an examination of structural characters Mr. Butler considered that these insects presented no resemblance to the Sphingidae, with which they had hitherto been allied, but were more related to the Pyrales and the Gelechiidae. The President, in favour of this view, remarked that the whole of the Aegeriidae had been made to depart from their congeners in appearance through the action of mimicry.—The Secretary read a paper by Mr. A. H. Swinton on "The Biology of Insects as determined by the Emotions." The paper dealt chiefly with cases of simple muscular contractions and secretions.—Mr. Peter Cameron communicated a paper "On Some New Genera and Species of Tenthredinidae."

ROYAL SOCIETY.—(Thursday, March 7.)

F. A. ABEL, Esq., C.B., in the Chair. The following papers were read:—"On the Photometry of the Magneto-Electric Light," by Captain Abney; "Experimental Researches on the Temperature of the Head," by Dr. J. S. Lombard; "Addition to Memoir on the Transformation of Elliptic Functions," by Prof. Cayley.

LINNEAN SOCIETY.—(Thursday, March 7.)

DR. GWYN JEFFREYS, F.R.S., V.-P., in the Chair. Mr. Thomas Christy exhibited a series of fruits, among which were Chinese quinces, chayottes, and a remarkable citron, known in China as the "Claw of Buddha."—Prof. Ray Lankester also brought forward and made remarks on a collection of fossil walrus tusks (*Tricheodon Huxleyi*!) from the Suffolk Crag, sent him for examination by Mr. J. E. Taylor, of the Ipswich Museum.—Examples of a variety of *Helix virgata* were likewise shown by Mr. Rich.—"On Nudibranchiate Mollusca from the Eastern Seas," by Dr. C. Collingwood, was the first paper read. He remarks that residents searching carefully within limited areas have more chance of obtaining new and interesting forms than have zoologists of equipped expeditions who only pay hurried visits to tropical coasts. Season

and other influences have much to do with abundance and paucity of species in given localities. He gives curious instances of specimens of nudibranchs isolated in a dish of sea water spontaneously and with uncommon neatness amputating the region of their own mouth. With other information the author proceeds to describe sixteen new forms, illustrating the same with coloured drawings from nature.—Mr. Thomas Meehan's paper "On the Laws Governing the Production of Seed in *Wistaria sinensis*" was communicated by the Rev. G. Henslow, in the absence of the author. The latter alludes to the fact that the *Wistaria* when supported grows amazingly, but is seedless: on the contrary, the self-supporting so-called "Tree *Wistarias*" produce seeds abundantly. These cases illustrate the difference between vegetative and reproductive force; they are not antagonistic but supplement each other. While *Wistaria* flowers freely without seeding; it has been supposed this arises from the bees not cross-fertilising. Mr. Meehan submits data, however, in which he thinks that the question lies rather in the harmonious relation between the two above nutritive powers than with insect pollinisation.—The Rev. M. J. Berkeley, in an "Enumeration of the Fungi collected during the Arctic Expedition of 1875-6," mentions that twenty-six species were obtained, all determined save two. Seven are new species, and seventeen already known widely distributed forms. *Agaricus Feildeni* and *Urnula Hartii* are unusually interesting.—A paper "On the development of *Filaria sanguinis hominis* and on the Mosquito considered as a Nurse," by Dr. P. Manson, was read by Dr. Cobbold. Discussing general questions, he then proceeds to show that the female Mosquito after gorging with human blood repairs to stagnant water and semitorpidly digests the blood. Eggs are deposited which float on the water and become the familiar "jumpers" of pools. The *Filaria* thus enter the human system along with the drinking water. Dr. Manson got a Chinaman whose blood was previously ascertained to abound with *Filariae* to sleep in a "mosquito house." In the morning the gorged insects were captured and duly examined under the microscope. A drop of blood from the Mosquito was thus found to contain 120 *Filariae*, though a drop from a prick in the man's finger yielded only some thirty. The embryo once taken into the human body by fluid medium pierces the tissues of the alimentary canal. Development and fecundation proceed apace, and finally the *Filariae* met with in the human blood are discharged in successive and countless swarms—the genetic cycle being thus completed.—Dr. Cobbold on his own behalf further contributed a paper "On the life history of *Filaria Bancrofti*, as explained by the discoveries of Wucherer, Lewis, Bancroft, Manson, Sorsino and others."

CHEMICAL SOCIETY.—(Thursday, March 7.)

DR. GILBERT, V.-P., in the Chair. The following papers were read:—"On some new Derivatives of Anisole," by W. H. Perkin. The author has obtained orthovinylanisole, boiling at 195-200° C.; sp. gr. at 15°, 1.0095; orthoallylanisole, boiling at 222-223° C.; sp. gr. at 15°, .9972; and orthobutenylanisole, boiling at 232-234° C.; sp. gr. at 15°, .9817. The author compares the physical properties of the ortho- and para-compounds; the former boil about 10° lower, have a slightly higher specific gravity, and crystallise with much greater difficulty.—"Note on the Action of Ammonia on Anthrapurpurin," by W. H. Perkin. The author has investigated the colouring matters produced by the action of heat on an ammoniacal solution of anthrapurpurin in sealed tubes at 100° and 180° C. At the former temperature an unstable substance was obtained, dying alumina mordants purple, and weak iron mordants indigo-blue. At 180° a new substance, anthrapurpuramide, was formed which does not dye mordants.—"On certain Polyiodides," by G. S. Johnson. The author attempted, without success, to prepare a compound, having the composition AgRI₃, or a similar substance having thallium in place of silver; various compounds of silver and potassium, thallium and potassium, and especially a very complicated substance containing lead, acetic acid, and potassium and iodine, were formed and analysed. The latter substance crystallises in square prisms; of the six faces two have a dark purple, and four a greenish-golden reflection.—"On an Improved Form of Wash-bottle," by T. Bayley. The object of this contrivance is to prevent the reflux of steam or other gases, such as ammonia, into the mouth of the operator, without losing the advantages

come, and he decided in consequence that it would be better to begin printing at once, as matter came in, relying upon the lists of subjects, and on the copious indexes furnished with each volume, to bind the whole work together, and form a key to the vast assemblage of works and names.

The object of the Inventory is twofold. In the first place the interests of the student are considered:—"L'Inventaire que nous projetons," says M. de Chennevières, "une fois fait et bien fait sera publié sous la surveillance et sous la responsabilité de la Commission, et mis ensuite à la portée de tous. Dès lors, quiconque aura souci de s'instruire pourra aller ici ou là en connaissance de cause." The precautions taken, as cited above, ensure the fullness and accuracy of the information furnished. The Inventory will, however, serve another purpose—it will prevent, it is hoped, the disappearance if not the destruction of the objects catalogued. Intentional destruction is a matter of rare occurrence, and takes place on a great scale only under exceptional conditions. The active fanaticism of men frenzied by religious or political zeal has, indeed, inflicted heavy losses on France; but it may be questioned whether the wars of religion and 1789 combined have as much to answer for as ignorant indifference or cupidity. Do not let us forget, says M. Guiffrey in a recent work on the Royal Tombs at St. Denis—do not let us forget that if the Terror scattered to the winds the bones of the princes interred at St. Denis, it preserved at least as "utile à l'histoire de l'art" the stone effigies which had been, by the most enlightened men of the Monarchy, condemned to perish. When we talk of the acts of 1793, when we talk of the Commune, do not let us forget the cold-blooded destruction of the Chapel of the Valois by the orders of the Regent, and the singular "restorations" perpetrated, in the very spirit of a modern English ecclesiastical architect, by Louis XVIII. The transactions to which M. Guiffrey has devoted his latest researches show us the clergy themselves, who should have been the jealous guardians of the monuments committed to their care, beautifying their church by getting rid of the stalls and pavement of the choir (both of which are said to have dated from the thirteenth century), and eagerly seeking the authorisation of the Government for the removal of the royal tombs, which in their opinion disfigured the Church of St. Denis. The fall of Louis XVI. alone prevented the execution of the proposed improvements; and long before that event took place Notre Dame had suffered irretrievably from similar causes. Yet, hideous as were the "improvements" inflicted by the eighteenth century, it may be questioned whether it had not been wiser for us to let them alone, as not all the taste and learning of the accomplished architects to whom has fallen the rehandling of Notre Dame has succeeded in animating their work. No work can be made to look alive in which we miss the *raison d'être*. From this point of view we may, indeed, ask ourselves whether the "mutilations and adaptations" of the eighteenth century are not more intelligent

than the restorations of the nineteenth. They had for their end a living object: they were meant to bring the appearance of the building into harmony with the life of the day—that is to say, into accordance with the fashions and tastes prevailing among those who then worshipped in it. This attempt involved no violation of the conditions of life. Fertility is the essential function of true life, whether of mind or body, and the architects and decorators of the eighteenth century were at least producing after their kind. That which they did we may judge. They destroyed too often the expression of a life which was noble and beautiful, to replace it by the expression of a life which was neither: but their work was an expression of life; it was production; it involved the action of creative energy called into being to fulfil necessities of its day. Can we say as much of that which the next century will inherit from us? Are the restorations which have occupied so much of our energy prompted by the needs of our time, of our lives? Have they rendered our buildings more useful to us, or their character more in accordance with that of our own habitations and costume? Take Notre Dame or La Sainte Chapelle, take English cathedrals, or, in the Universities, take for example the senseless acts by which the quadrangle of Christchurch at Oxford has recently been disfigured. Everywhere we see zealous antiquarian mimicry; but mimicry, however learned, is not production.

There are, however, another class of dangers which involve losses as serious as those which spring from intentional destruction, or adaptation, or restoration. To these are superadded those which come of mere love of novelty, and to this cause are probably due many of the mysterious disappearances which now and then take place. The same impulse which renders the cottager eager to exchange his Oriental porcelain for new stone-ware, gay with coloured flowers, has too often prompted the guardians of the sanctuary to part with treasures which are in their eyes *laid*—that is, shabby—thus procuring to themselves the means for fresher and more showy decorations. About two years ago, I believe, several flagrant cases of sales of this character were brought under official notice, and a warning circular went forth from the Ministry of the Interior. Now any transactions of the kind will be rendered almost impossible by the mere existence of the General Inventory; and how much they are to be dreaded those alone can guess who have examined the riches stored in the *trésors* of provincial churches and cathedrals. Sens, for example, possesses not only jewels of great archaeological interest, fine ivories, and many enamels, but tapestries of great antiquity, and of the rarest beauty and condition. At Sens these precious things are appreciated, proudly shown, and carefully preserved; but in towns of less importance, in sacristies where no curious visitors form an active police, and in local museums the contents of which are imperfectly catalogued, there are hidden objects whose existence is barely known, and whose disappearance may take place without attracting attention until it is too late to track or to recover. This side of

the task to be fulfilled by the Commission of 1874—the task of searching out the obscurer corners of the country—is no less important, if less brilliant and less grateful, work than that of setting before us the obvious wealth of Paris as a splendid whole. Of this its members are aware, and the greater part of the next volume—which contains the Hôtel Soubise, and which it is hoped will soon be in our hands—is devoted to the contents of various provincial museums hitherto uncatalogued and consequently unknown.

In conclusion it may be well to mention that it has been stated by the reviewer of the volume now before us in a leading daily paper that the wood-carvings of the choir of Notre Dame have "disappeared." This is not the case. These wood-carvings, known under the name of "*Vœu de Louis XIII.*," were the part which was last completed of the works undertaken in Notre Dame in fulfilment of the vow made by the king to the Virgin on February 10, 1638, when it was formally announced that Anne of Austria was with child. The obligation of carrying out the project devolved on his successor, and it was finally realised in 1699 under the direction of Hardouin Mansard. The stalls of the choir, and the fittings to which they were attached, were wrought from the designs of Du Goulon, sculptor to Louis XIV., by Marteau and Nel. Their great beauty and admirable state of preservation secured them mercy at the hands of the architect who has recently "restored" the nave of Notre Dame, and the position only of the two pulpits—placed formerly at the far end of the stalls on either side of the high-altar—has been changed. They are now at the entrance.

E. F. S. PATTISON.

THE DUDLEY GALLERY.

(Second Notice.)

WE must deal somewhat briefly with that section of the Dudley Gallery which we were unable to include in our original review. Among the artists not already discussed, Messrs. Cabianca, Arthur Severn, Jackson, and Penstone, Mrs. Stillman, and Miss Greenaway, claim to be spoken of with consideration.

The Venetian view by Signor Cabianca, *Under the Bridge of the Baretieri*, is perhaps the most brilliant performance in the gallery: vivid in light and shade, and in tint, done with the directness of a gifted and highly practised hand, and exceedingly like what every visitor to Venice recollects—the gliding of the barge under one of the low bridges in the narrower canals, with bright and flickering sunlight, and gurgle of water. Mr. Arthur Severn's largest picture is *Cromer after Sunset*—an effect of blue and red in sky and sea which produces a general impression on the eye not unlike that of shot silk. The successive ridges of surf roll in on the flat beach, losing their white in the all-pervading hues of reflection, and in texture (it may be admitted) rather too woolly: five fishing-boats are near the shore, below the pale crescent moon; and a dog wades forward to bay after his reeding master. This is, on the whole, a striking and well-observed scene; yet hardly equal to another by the same artist, *Sunlight Effect over the Jura, Lake of Geneva*, in which the sense of transitoriness in the atmospheric lustre, without momentary shifting, is well given. Mr. Jackson is a manifest disciple of Mr. Burne Jones. *Under the Trees of Paradise* has, along with much mannerism and immaturity, a certain poetic abstraction which may deepen into intensity, and which will induce

us to look out for the artist in future exhibitions. The groups are saved souls of children and adults, accompanied by angels: one boy and an angel are walking on the surface of a rivulet. Of joy, cheerfulness, or even happiness, there is not a gleam on any countenance: all look wofully forlorn—sunk into the depression of permanent repose. The forms are elongated and the draperies crinkled: throughout we see the votary of a style. Mr. Penstone takes us back to Nature in his painting of a stray lamb—*The Wanderer, near White-horse Hill, Berks*: the meek little creature, unknowing what to do next, stands uncomplainingly in the centre of a group of white boulders, which simulate a sort of natural pound: the shepherd has now found his lamb, and will soon restore it to the flock. The simple and seemingly quality of design in this work, and its grave gentleness of feeling, merit high commendation, qualified nevertheless on account of the want of softness or harmony in the colour—a defect on which we have before had to remark in Mr. Penstone's productions. No such blemish affects Mrs. Stillman's picture—*Through the Gipsies' Hollow, Bonchurch, Isle of Wight*—which is full at once of shadow and of colour, deep and rich, with gleams of light here and there. The personages are four girls and a boy, gathering May-bloom and primroses: the details can hardly be appreciated, at the height at which the work is hung. Miss Greenaway makes a rather too deadest at children, not far removed from infancy, of one particular mould of face—noticeable in special for protrusive and immobile eyes, and for a perennial pout of the lips. She pets her babies, and her own notion of a baby-face, somewhat too obviously and insistently. There is, nevertheless, a good deal to praise in her *Procession of Children*, decoratively treated; still more in the small examples, *Derby and Joan*, and *Miss Patty*, which will captivate many maternal and other hearts. The first of these two is, indeed, so quaintly felicitous in its way as to be almost a masterpiece.

Rahab and the Spies is a well-meant and quasi-earnest attempt by Mr. Oliford in a serious mode of art; but it has neither intellectual core nor physical backbone, and to laud the artist would be merely to compliment him. The *Spring* of Mr. H. R. Page might to some extent be named along with Mr. Jackson's picture, already spoken of, as a specimen of preposse style; it is, however, more bold and resolute, and shows considerable force of intention and of handiwork. *La Maison aux Chats Blancs* is a nice example by Mrs. Bridell-Fox: one white pussy is engaged at her bowl of milk, another is so much occupied in dozing on a window-sill as to ignore the saucer coaxingly held up towards her by a girl in blue. We may also refer to figure-pieces by Miss Bertha Johnson, and Messrs. McFadden, Arthur Burchett, and Letherbrow.

Among the remaining landscapes there are several works of superior quality: as Mr. Donaldson's *Old Tower on the North River, Great Yarmouth*; Mr. Sowerby's *Summer Thoughts*—rather flat as a whole, but with an uncommon amount of definition of foreground weeds and vegetation, &c.; Mr. Edwin Ellis's *Seashore Memories*; and Mr. Crane's *Bamburgh Castle from the Duddie Hills*. We must, however, be content merely to specify these pictures, and to name along with their authors Messrs. T. J. Watson, Hartland, Coutts, H. M. Cook, W. P. Burton, G. L. Hall, Harry Hine, Charles Richardson, Hoffman, and J. A. Fitzgould, and Mrs. Rodichon. Flower and foliage painting is capably represented by Blanche Hansbury, Mrs. Boyle, Mary Butler, and Caroline Norman; while an owl and two crayfish, by Rose Stanton and J. Aston, may stand for the fauna of the Dudley Gallery.

W. M. ROSSKILL.

ART SALES.

A SALE of Ancient Drawings (one of the largest that has occurred for some time) took place at Messrs. Sotheby's on Friday in last week. The collection had been formed by Mr. Barron Grahame, F.S.A., of Morphee, Scotland, chiefly many years since, and contained at least a few interesting examples of eminent masters among a number of sheets which to the wary collector would not fall under the category of desirable possessions. For several of the least remarkable drawings high prices were given, while certain noteworthy examples passed unregarded among a crowd of insignificant companions. The high prices, or what in view of the general contents of the sale, may be considered the high prices, were, it is conjectured by some, due to the Grosvenor Gallery Exhibition having done a little to revive among buyers a taste for the designs and studies of old masters or those which purport to be such. A landscape drawing, chalk, tinted with colour, and assigned to Albert Cuyp, fetched 8*l.* 10*s.*; cattle and peasants, by Berghem, 7*l.*; a mixed lot consisting of two or three examples assigned to Carlo Dolce and two small drawings ascribed to Albert Dürer, fetched 21*l.* 10*s.* (Noseda); little lots of landscape drawings by Rembrandt, of the authenticity of at least one or two of which there could be no doubt, fell for 12*l.* 10*s.* and 15*l.* 15*s.*: a coloured drawing of *Nymphs and Satyrs*, attributed to Rubens, fetched 10*l.* 10*s.*; a very finished example of a comparatively little-known artist, H. Steenwyck—an *Interior of the Jesuits' Church at Antwerp*, sold for 5*l.* 7*s.* 6*d.* The examples of some others of the Dutch or Flemish Masters, such as Van de Velde and Ostade, were without importance. Two lots of drawings assigned *en masse* to Watteau, fell for 10*l.* 10*s.* and 16*l.* 10*s.* respectively (Hogarth). Each contained some delightful little sketches and studies undoubtedly by the master of Eighteenth-Century design in France: one of a woman spinning, with studies of hands on the same sheet, in the best manner of Watteau; another of a boatman, another of an elderly man leaning towards the just indicated head of a woman, and one or two studies of the backs of figures.

THE works of art belonging to the late M. Poulet-Malassis, and consisting for the most part of a large collection of the etchings of Felix Bracquemond and of Alphonse Legros, were sold on Saturday last, by Messrs. Sotheby, Wilkinson, and Hodge. The collection of the work of M. Bracquemond proved only second in importance to that in the possession of M. Philippe Burty, which is likely to fall under the hammer during the spring; while that of the work of M. Legros was presumably the largest in existence, M. Malassis being known, in conjunction with M. Thibaudau, as an industrious cataloguer of the etchings of that artist. Bracquemond's etchings are perhaps, as a whole, not as well known in England as they might reasonably be, though that there are some admirers of them among us is shown by the sum of nearly eight pounds having been paid on Saturday for an impression of his very admirable reproduction of the great Holbein in the Louvre—the portrait of Erasmus. It may be doubted whether any of his original work approaches in excellence this most faithful and scholarly rendering of the work of the great early portrait-painter. We append, further, the prices of only two or three favourite prints:—*Portrait of Méryon*, 2*l.* 6*s.* (Noseda); *Le Cimetière*, 5*l.* 5*s.*; *Le Corbeau*, 4*l.* 15*s.*; *Le Parc à Moutons*, 5*l.* 7*s.* 6*d.*; *Les Sarcelles*, a unique impression of the state, 4*l.* 4*s.*; and *Le Lièvre*, 4*l.* 12*s.* 6*d.* (White). Several drawings, in chalk, in bistre, and in pen and ink, by M. Alphonse Legros, were subsequently sold at prices varying from about three to eight or nine guineas. Among the many etchings of this artist we cite but a few, which realised the highest prices. *Portrait de l'Artiste*, 7*l.* 5*s.*; *Grand Portrait de Thomas Carlyle*, second state,

12*l.* (Thibaudau); *Les Chantres Espagnols*, first state, 5*l.* (Thibaudau); second state, 2*l.* 17*s.* (Hogarth); *La Mort du Vagabond*, second state (but better impressions have, we believe, been seen), 3*l.* 10*s.*; *Les Bûcherons*, second state, 4*l.* 6*s.* (Brown); *Les Soules Têtarès*, very rare, 4*l.* 5*s.* (Thibaudau); *Le Savant Endormi*, a unique impression of one of the most imaginative works of the artist, sold for only 2*l.*; and, as an illustration of the chances of sales it may be mentioned that for only a few shillings there was sold a most rare impression of the first plate of the poetical subject of *La Mort et le Bûcheron*: the second plate, which is the one generally known to the public, was only etched after an accident had destroyed the first. We observe that during the same week in which Messrs. Sotheby will sell the Cambridge Rembrandts, and Messrs. Christie the Rembrandts of the late Mr. Seymour, the latter firm will dispose of a collection of rare old line engravings as well as of the most noteworthy assemblage of Turner's paintings and drawings from the Novar collection. The week appointed for these sales—the first in April—promises to be the most important of the season.

NOTES ON ART AND ARCHAEOLOGY.

WE have already mentioned that it was intended to exhibit at the Brazenose Club, Manchester, a very large collection of the works of Mr. J. D. Watson. The exhibition having now been open for a considerable time, the club has prepared for private circulation a *catalogue raisonné* of the pictures on view. This is most carefully done, and Mr. Watson must be deemed a fortunate artist in having secured during his lifetime so excellent a record of his work. The Catalogue is adorned with very pretty though slight illustrations, which sufficiently witness to the generally-attractive nature of this artist's design.

MR. SCOTT is engaged upon an invention which is not of a kind with which his friends are wont to associate his name. He has, we are informed, progressed far with a design representative of the Parisian Boulevard as it may be supposed to have appeared at the hour when the news of the execution of Marie Antoinette was noised abroad among its medley crowd of frequenters.

WE hear that George Cruikshank left behind him, at his house in the Hampstead Road, and in the charge of his wife, a very considerable collection of his works. Among these will be found, not only books and prints, but water-colour drawings, which he had long been reluctant to sell. It is even rumoured that among them are the original designs for the famous illustrations to *Oliver Twist*; and there is said, we hear, to be a series of designs for the Falstaff illustrations published many years later—and these at all events are full of colour. It is said that arrangements are in progress for the early sale of the collection—the books and prints at Sotheby's in April, and the drawings at Christie's during May. The Cruikshank collectors—the number of whom appears to be on the increase—will anticipate these events with considerable eagerness.

WE regret to hear of the very serious illness of Mr. Holman Hunt at Jerusalem.

THE Exhibition of Water-colours opened for this season at Messrs. Agnew's Galleries in Bond Street contains, as usual, some good things; not to speak of the oil-picture by Mr. Millais named *Yes*, which was a principal attraction in the last Royal Academy show, and which now reappears here. Another Millais—a water-colour reduction of his early picture of *Opheelia* drowning, which ranks to this day as one of his most beautiful and touching productions—accompanies the oil-painting. A half-hundred of large and well-treated water-colours by Mr. Walter Stevens, from a wide area of sketching ground—England, Scotland, Ireland, France, Italy, Spain, and Egypt—are

well worth examination; more especially, perhaps, the Irish subjects. We may also name contributions by Turner, Lewis (the *Edfou*, a *Sheik Encampment*, is a far finer example than the large and well-known *Easter-day at Rome*), Warwick Brooks, Barrett, J. Parker, Gilbert, Burne Jones (two comparatively early compositions, *The King's Wedding* and *Pyramus and Thisbe*, both on vellum), E. K. Johnson, William Hunt, Elijah Walton, and Cox.

THE German Athenaeum, 51, Mortimer Street, again held, from March 1 to 14, a display of paintings, including a good proportion of able and interesting works. Mr. Wolf was in great force; showing equal and consummate mastery over elephant, owl, wild boar, osprey, lion, falcon, stag, and hare. Mr. Herkomer contributed several examples: a *Portrait of a Lady* (of advanced age), and a landscape, *Under the Mid-day Sun*, being particularly noticeable. Other puissant exhibitors were Cecil Lawson, Alma-Tadema, Gregory, Lenbach (*Portrait of Dollinger*), and Burne Jones. The total of works exhibited was not much less than a hundred.

If any person—more especially any person who has not been in the lands of the Orient—wishes to experience a sensation of dreamy and luscious delight, and to pass a shred of his day in the presence of beauty, he should visit just now the show-rooms of Messrs. Robinson and Co., the carpet-dealers, 34, Wigmore Street. This firm held in the spring of 1877 a small exhibition of Eastern carpets and decorative work, "chiefly acquired during some years of search in Persia, the Caucasus, and other Oriental countries." They have now got together another collection of like kind, replete with gorgeous, precious, and exquisite articles, but above all memorable for the "Room from Damascus" which serves as the repository of a certain proportion of the objects. A little pamphlet by Mr. Edward Stebbing, *Half-Hour in an Eastern Apartment*, well worth preservation on its own account, constitutes a catalogue to the collection and a manual of information on the subject generally. The room from Damascus is thus mentioned:—

"An opportunity presented itself of acquiring the internal fittings of a room in Damascus, dating, as testified by the inscriptions on the walls, from the year of the Hejira 1174. Under the direction of Mr. Caspar Clarke (whose acquaintance with Persia and other Eastern countries has been of the highest value, and to whom the discovery of the chamber, and the idea of transplanting it to England, are owing), the panelling was successfully removed; and the entire apartment has been reproduced in one of the galleries, where it has been treated in a manner representative of Oriental ways and customs still to be found universal at the present day. The apartment comes from one of the houses of a long thoroughfare in Damascus, at present narrow and irregular, but occupying a site of great historical interest, once the 'street called Straight.' Beneath the window facing the entrance to the chamber there are two carved frames of woodwork, which, though merely replacing portions of the original panelling, have an interest of their own, both as being shutters from the tomb of Saladin, and as affording evidence of the influences of romantic tales upon Eastern imaginations. Anxious to visit the resting-place of Coeur de Lion's famous rival, Mr. Caspar Clarke experienced every obstacle from the incredulity of the Arabs; who could not be persuaded that curiosity, and not the secret knowledge of some hidden treasure, prompted his undertaking. At length, however, recalling to mind Sir Walter Scott's well-known description in the *Talisman*, he told to willing listeners how in the far-off days, when the leech's knowledge and the leech's skill were gifts of the Arab rather than as at present of the Frank, the mighty English monarch, lying stretched within his tent upon a couch of anguish, was saved from imminent death by the generosity and the skill of his rival, who in disguise, despite every danger, attended him in person. Now the right chord was touched: the incident was at once believed, and was soon the common property

of the town. The pilgrim's curiosity was clearly understood, and his zeal rewarded by the gift of the shutters from the generous Saladin's tomb."

We cannot pause over other readable and serviceable details set forth in the catalogue. The collection is treated of under the headings of Carpets, Embroideries, Tiles and Pottery, and Metal-work. Many splendid carpets and other such fabrics, which Messrs. Robinson are about to send to the Paris Exhibition, were also stored on the premises at the date (March 18) of our visit.

THE initial volume of M. Alphonse Legros' projected series of popular Biblical legends, *L'Histoire du Bonhomme Misère*, just published by R. Guérault, Orris Villas, Hammersmith, is a sumptuous book. Elaborately printed, on fine Whatman paper, in brilliant inks and curious types, and with a sort of luxury in the matter of initials, head and tail-pieces, red lines, broad margins, and blank pages, it is bound in fine golden parchment, lettered in black and red, and is very comely and Dutch to look upon. The text of the legend is M. Champfleury's; the preface, a piece of exquisite French, is from "another hand"—an unknown. M. Legros has illustrated the myth with six etchings:—(1) *Saint Pierre et Saint Paul à la Porte de M. Richard*; (2) *L'Entrée chez Misère*; (3) *Le Souper chez Misère*; (4) *Le Voleur de Poires*; (5) *La Mort dans le Potier*; and (6) *Depuis ce temps-là*. Of these, one, the fourth, would seem to be a failure; the others bear all the marks of M. Legros' peculiar talent at its best. Two at least, the third and sixth, as examples of creative art, rank higher than most of his work, which, with all its many fine qualities, is not seldom apt to be somewhat baldly and pedantically realistic. The issue is confined to sixty copies, which are numbered and signed by the artist. The second number will be devoted to the story of *The Wandering Jew*.

AN important addition has just been made to the collection of works by Luca della Robbia in the South Kensington Museum by the reproduction of his marble *Cantoria*, or Singing Gallery, in the Duomo at Florence. This gallery was taken down about two centuries ago, on the occasion of a wedding in the chapel where it stood, and since then its beautiful bas-reliefs, with the groups of musicians and singers in various attitudes that were so highly commended by Vasari, have been exhibited as separate works in the Museum at Florence. Casts have now been taken of all these, as well as of the architectural portion still remaining, and the whole has been reconstructed and set up with fine effect in the north Court of the Museum. The musical groups depicted in the ten panels are seen, even in the cast, to fully deserve all that Vasari has said about them. The grace and freedom of action of the figures as they join in the choral songs, dance, and play upon all kinds of instruments, are indeed admirable, and it is, no doubt, true that "even the very inflation of the throat of the singers can be distinctly perceived" when examined closely, though at the height at which the gallery is now placed, it is not possible to distinguish these minute details. A scaffolding in front also at the present time shades the panels somewhat from view; but this will be taken down in the course of a few days. The cornice, brackets, and other architectural portions of this work, are not so remarkable as the sculptures. They are somewhat similar to those of the other *Cantoria* by Baccio d'Agnolo, which has been for many years in the same court. It is hoped that before long another of these richly-ornamented galleries may be added—the one of which Vasari speaks as having been executed by Donatello, and placed opposite to that of Luca in the cathedral.

ANOTHER interesting work of art lately added to the Museum is a cast of an ancient brass font in the church of St. Bartholomew at Liège, said to have been executed by the Flemish

sculptor Lambert Patras in 1112. Around this font, which is described by Schaepekens in his *Art in Belgium*, are represented, in bold high relief, the baptisms of the different Apostles, with that of Christ in front, around whom the water comes up like a garment, while two angels stand by, offering a towel. The other baptisms take place in small tubs, into which the saint is immersed up to his waist, his head and shoulder appearing above with a very quaint effect. Below these reliefs are twelve half-figures of bulls, symbolising the twelve apostles, standing out in the boldest relief; not cast in the same mould, as they would be now, but all in different positions, and some of them butting furiously. This font has been presented by the Belgian Commission for the interchange of reproductions of works of art.

IN the last two numbers of the *Chronique des Arts*, M. Henry Havard, who, as we have before mentioned, has been for some time occupying himself in searching over old Dutch archives and other records in the hopes of finding traces of various Dutch masters, contributes the result of his researches with relation to Quiring Brekelenkamp, a master concerning whom not even a single well-authenticated date has hitherto been known. M. Havard finds that Brekelenkamp was born, probably at Swammerdam, near Leyden, and that he was established in Leyden in 1648, in the March of which year he was received into the guild of St. Luke. A month after this he was married to a young girl of the name of Carle or Scharle, living in Leyden, and six children, whose baptisms were all registered in the parish church of the Bakkersteeg, were born to him between the years 1649 and 1655. In this last year his first wife died, but in 1656 he remarried with Elizabeth van Beaumont, widow of William Symoutz, three children resulting from this union, the last of whom was born in May, 1668. In this same year the death of Brekelenkamp is briefly noticed in the books of the guild of St. Luke. These facts, although they afford no precise dates for the many charming pictures by this artist that are scattered in various collections, yet make it evident that his artistic activity must have extended over about twenty years, that is from 1648 to 1668.

THE refusal of Germany to take part in the French Universal Exhibition has been relaxed in favour of painters and sculptors. By a recent decree of the Emperor these artists are permitted to contribute a certain number of works, and a commission of control has been appointed for the purpose of examining and approving of those sent in. This tardy participation of Germany has necessitated several alterations in the Fine-Art section of the Exhibition. The galleries destined for national manufactures have had to be given to the German contributors, and a pavilion constructed outside opposite the Indian Palace of the Prince of Wales, for the French Industrial Exhibition.

THE Municipal Council of Athens at one of its last meetings voted the erection of a commemorative column at the entrance of the Acropolis, inscribed with the names of all those who either by their writings, discoveries, or in any other way had manifested active interest in the cause of the Hellenes.

THE STAGE.

HERR NEVILLE MORITZ, the Hungarian tragedian, whose reputation in various continental cities as a Shaksperian actor had awakened rather high expectations, has unfortunately not created in England any great impression in his favour. Of his performance in *Othello* we have already spoken. On Saturday evening he made his first appearance at the Queen's Theatre in the character of Shylock, in the acting version of the play, which transposes and curtails some of the scenes and ends near the

close of the fourth act with the incident of the trial. Herr Moritz's Shylock presents no very glaring defects; it is certainly not deficient in force; but it wants variety, and is not lighted up at any point with those flashes of genius by which a great performer is able to excite the imagination and to stir the feelings of an audience. The "business" of the part, as it is technically called, that is the details, great and small, of interpretative action, which he introduces, are generally familiar on our English stage. Herein at least we find few of those fruits of independent searching of the text which might be looked for in an artist who is represented by zealous friends as having satisfied the requirements of German commentators and students of Shakspeare. The malignity of Herr Moritz's Jews seems to want the steadfast inward strength which can indicate itself in due season without fierce gesticulation or explosions of passion. Like the affection of the Queen in the play scene in *Hamlet*, it "protests too much," and finally leaves the impression of one who may or may not be malicious, cruel, revengeful, and deeply conscious of his own sufferings, and of the wrongs of his race, but is, at all events, determined that nobody shall take him for anything of a more meek or amiable turn. Of the general characteristics of the performance of *The Merchant of Venice* at the Queen's Theatre, little need be said. The part of Portia demands more youth and grace than Mrs. Arthur Stirling—though an actress of pleasing appearance—possesses; but unfortunately, our actresses rarely attain so much excellent art as this lady displays before their first youth has passed. Mrs. Stirling speaks the famous description of mercy with a correctness of emphasis and a general sincerity of intonation that are extremely rare upon our stage.

In the way of elocution of a lighter and more graceful kind, we have, however, an example deserving of notice in the case of Miss Louise Moodie's delivery of a short epilogue or rhymed "tag" to a comedietta by Mr. Grundy, entitled *Man Proposes*, produced at the Duke's Theatre this week. The little piece itself has not much to recommend it. The author seems to have taken for his model the trifle entitled *Uncle's Will*, in which Mr. and Mrs. Kendal occasionally afford so much delight to audiences; but the relations of his lady and gentleman are neither so fresh in conception nor so interesting in themselves as those of Mr. Theyre Smith's hero and heroine, and his dialogue wants the conciseness, the refinement, and the grace that are above all needful in a little piece almost devoid of incident. The few rhymed heroic couplets to which we have referred are yet very cleverly written; and these are spoken by Miss Moodie with the delicate variations of tone and fleeting shades of emphasis that carry all the spirit and meaning of a passage at once to the ears of an audience. We confess that we have not found much charm in Miss Moodie's acting in this little piece. Her manner is somewhat artificial; her explosions of high spirits are not infectious; and she has aggravated these grounds of complaint by assuming a fair wig of much too imposing a degree of bloneness and luxuriance; but her delivery of verse nevertheless affords a peculiar pleasure, for which we must as a rule go to the French stage.

THE indisposition of Mr. Phelps—which it is to be hoped will prove to be only temporary—has deprived audiences at the Aquarium Theatre of the advantage of seeing him in some of his famous characters; but a theatre which is strictly confined to afternoon performances is necessarily better able to reinforce its company than those houses which are only open in the evening. The engagement of Mr. William Farren provides the spirited revival of Sheridan's comedy of *The Rivals*, now performing at this theatre, with a representative of Sir Anthony Absolute who could hardly be conceived to be better qualified for the part. The cast indeed—which includes Miss Litton as Lydia Lan-

guish, Mr. Lionel Brough as Acres, Mrs. Chippendale as Mrs. Malaprop, Mr. Conway as Captain Absolute, and Mr. William Rignold as Sir Lucius O'Trigger, is singularly efficient and complete. These advantages, coupled with the circumstance that *The Rivals*—unlike *The School for Scandal*—has not been revived for some time, sufficiently explains the sort of rage for going in the afternoon to the Aquarium Theatre which seems to have seized upon that staid and decorous portion of the playgoing public who eschew late hours, and decline the conveniences of special midnight trains.

The Scar on the Wrist at the St. James's Theatre will shortly be replaced by a new play from the joint pens of Mr. Tom Taylor and Mr. Paul Meritt.

A PLAY entitled *Joseph Balsamo*, written by M. Alexandre Dumas, and founded upon the celebrated novel by his father of the same name, has been produced at the Odéon with success. It is an elaborate historical drama of the time of Louis XV., in which Marie Antoinette the bride of the Dauphin, afterwards Louis XVI., is a leading personage. History is melodramatically treated; exciting incidents and strong contrasts abound, and altogether the work does not belong to a high class; but the dramatic elements of the play are set forth with a skilful hand. In one scene Mlle. de Tavernay relates the story of her dishonour in a sleep supposed to be induced by magnetic influences. The great spectacle of the play is a representation of the Court of Louis XV. at Versailles, with tabourets of honour placed for favoured ladies and the halberdiers in rich uniforms ranged around.

MUSIC.

CRYSTAL PALACE.—MACFARREN'S "LADY OF THE LAKE."

THE first performance in London of Prof. Macfarren's cantata, the *Lady of the Lake*, attracted a large audience to the Crystal Palace last Saturday. The work was composed for the opening of the new Music Hall in Glasgow, and was first performed in that city last November. The words, which are almost entirely taken from Scott's poem, have been adapted for musical purposes by Mrs. Macfarren; and it will be well, before speaking of the music, to say a few words as to the libretto.

Under no circumstances is it an easy task to arrange a poem which is mainly narrative and descriptive rather than dramatic as a cantata; and in the present case Mrs. Macfarren, skilled writer as she unquestionably is, must have experienced no ordinary difficulties. That these have been in all instances successfully overcome it would be too much to assert; it is doubtful, indeed, whether any manipulation could have converted the poem into a thoroughly satisfactory libretto for music. There is so much incident in Scott's tale which is of real importance in its bearing on the plot, that it was absolutely impossible to introduce the whole, or anything like the whole, into the cantata; consequently Mrs. Macfarren has been driven to such expedients as the insertion of parenthetic notes between the different numbers of the piece, of which the following, occurring between Nos. 14 and 15, is a sample: "Fitz-James pursues his way with caution, till at eventide, toil-worn, he comes unknown upon Roderick on the watch, by his fire." A libretto ought to tell its own story with sufficient completeness to be intelligible to the hearer without further aid; and as in the course of the cantata there are some eight or ten of these notes, explaining the progress of the action, it will be readily seen that a certain effect of patchiness must necessarily result. Here I think the fault rests not with Mrs. Macfarren, but with the subject, the choice of which was doubtless suggested by the fact that the work was commissioned for a Scotch festival. Again, the

treatment of the chorus, which is sometimes narrative, sometimes dramatic, can scarcely be called happy; and for this too, the choice of the subject must bear the blame. The general custom of composers is to set narrative passages as recitative; but in the present case so large a proportion of the text is narrative that Dr. Macfarren could never have adopted this method of treatment without seriously imperilling the success of his work. It is far easier to point out shortcomings than to suggest remedies; and though on the whole, the libretto can hardly be called satisfactory, I freely admit that I do not see what could have been done better with this particular subject, which, in spite of the opportunities it offers to the composer in isolated passages, is not as a whole well suited for adaptation as a cantata.

Passing now from the words to speak of the music to which they are set, it need hardly be said that the cantata is of high musical interest. It may be described in one sentence as pre-eminently intellectual and thoughtful music. Its clearness of form may almost be called logical; one idea seems to follow another naturally and, as it were, of necessity; but the effect it produces is that it sounds like music of the head rather than of the heart. It is always appropriate to the subject, frequently (as in the fine quartet "Kinsman and father" in the first part, or in the scene with Blanche of Devan, and the duet between Fitz-James and Roderick in the second part) highly dramatic. The quartet just mentioned, one of the finest numbers of the work, might be transferred to an opera without a note of alteration. But though the music interests greatly it but seldom warms. Melodic invention is hardly the composer's strong point. It need perhaps scarcely be said that there is no blame implied in this remark. The gift of melody is one which comes to a composer directly from Heaven; and a musician is no more accountable for the degree in which he may or may not possess it, than he is for his height or the colour of his hair. I am not denying Dr. Macfarren the possession of the gift; indeed, if I did, several numbers of the present work would rise up in disproof of the assertion. But in his music the melody is only of secondary interest; the points which rivet the attention and challenge the admiration, are the masterly workmanship, the command of all styles and of all schools—in short a control over the *technique* of composition in all its branches such as very few, if any, of his fellow-countrymen possess. In all these points *The Lady of the Lake* is a model; and it is just because these are the predominant characteristics of his style that the composer's music will appeal in general more to musicians than to the outside public.

It is needless, and it would be hardly intelligible without extracts, to enter on any detailed analysis of the music; but there are two points of interest which ought to be mentioned. The first is the extremely skilful manner in which, in order to give "local colour," Dr. Macfarren has introduced in several places the national Scotch scale, without the fourth and seventh notes, sometimes called the "pentatonic" scale. Many of the genuine Scotch airs are constructed upon this scale; and in the present work the composer has most happily caught the characteristic of this national music, especially in the part-songs, "Not faster yonder rowers' might," and "Hail to the chief who in triumph advances." The other striking feature of the work is the very copious use Dr. Macfarren has made of representative themes—"Leitomotive," to use the German phrase. These are employed nearly as frequently and quite as pertinently as by Wagner in his *Ring des Nibelungen*. In the very able analysis of the cantata, by Mr. Joseph Bennett, which was printed in the book of the words, these various themes are pointed out, both on their first appearance and at their subsequent recurrence. As Dr. Macfarren is probably not familiar with Wagner's latest works, and has most certainly

not formed his style on that of his great German contemporary, the coincidence is curious enough to be worth noting.

Of Saturday's performance it is unfortunately quite impossible to say much that is favourable. The solo parts were sung by Miss Catherine Penna, Madame Patey, and Messrs. Shakespeare, George Fox, and Robert Hilton. Madame Patey in the music of Malcolm Graeme and Blanche of Devan was magnificent; nothing finer could be wished for. Mr. Shakespeare sang with his usual delightful artistic finish; but his voice was not powerful enough for the music in so large a hall; and hence, through no fault of his, many parts failed to produce their full effect. Miss Penna sang conscientiously, as she always does, but the music was far beyond her power; and Messrs. Fox and Hilton were respectable but nothing more. The cantata requires a much stronger cast of soloists to do it justice. The chorus was most unsatisfactory, being alternately coarse and uncertain; and even the orchestra was less perfect than usual. May *The Lady of the Lake* when it is next heard in London receive a more efficient rendering than it did on Saturday!

EBENEZER PROUT.

AN addition to the ranks of acceptable pianists at the Popular Concerts has been made by the engagement of Herr Barth, who, it may be remembered, made his *début* in London at a Philharmonic concert two years since. Neither the work he played on that occasion—Henselt's Concerto—nor the pieces selected by him on Saturday and Monday last were calculated to prove his possession of the highest qualities as an executant. But that he has many of the essential qualifications of a pianist was sufficiently shown. His touch is clear and incisive, his command over the gradations of tone nearly perfect, and his style easy and unconstrained even when vanquishing such difficulties as present themselves in Brahms's Variations and Fugue on a theme of Handel, Op. 24. More than this it would be rash to say until Herr Barth is heard in some work that is recognised as a test of merit in the pianoforte player. A trio in F, Op. 18, by Saint-Saens, was added on Saturday to the very meagre list of novelties given this season. It is a sound, musicianly work, but in nowise remarkable for originality.

AT Mr. Dannreuther's last musical evening, at 12, Orme Square, on Thursday week, Beethoven's great Sonata in C, Op. 102, No. 1, for piano and violoncello, and Schubert's Trio in B flat, Op. 99, were the principal works performed. Mr. Dannreuther was assisted by Messrs. Henry Holmes and Lasserre; and Mlle. Hélène Arnim was the vocalist.

HERR BOSCOVITZ, a pianist who enjoys a great reputation in America, gave the first of a series of seven pianoforte recitals at the Steinway Hall, Lower Seymour Street, on the afternoon of the 14th inst., when he performed a selection from the works of Bach, Handel, Rameau, Chopin, and Liszt, besides a piece of his own. The second recital is announced for next Thursday.

THE last of the fifth series of Herr Franke's concerts took place at the Royal Academy Concert room, on Tuesday evening, when Mozart's quartett in D minor, Brahms's piano quartett in A major, and three sonatas by Scarlatti, were the chief items of the programme. The quartett party consisted of Messrs. Peiniger, Franke, Holländer, and Van Biene, and Mlle. Krebs was the pianist. The sixth series will commence on April 30, when the programme is to consist entirely of works by English composers.

MESSRS. GEORGE BELL AND SONS write:—

"In reference to the review of Mr. Hunt's *Concise History of Music* which appeared in your last number, we must, in justice to its author, state that the work did not contain his final corrections. By a misunderstanding the sheets were printed off before

the corrections reached us. . . . With regard to the series of 'Cambridge School and College Text Books,' of which this work and Mr. Banister's well-known work on music form a part, we wish to take the opportunity of stating that this collective title does not and is not intended to imply any sanction on the part of the University authorities."

THE *Requiem* of Berlioz was announced to be given at the Concerts du Châtelet, Paris, last Sunday, under the direction of M. Edouard Colonne.

It has been already announced that the orchestra of the Vienna Opera, under the direction of Hans Richter, and Gilmore's orchestra from New York, will be heard at Paris during the Exhibition. The *Revue et Gazette Musicale* now states that various other foreign orchestras express the same intention; among these are that of La Scala at Milan, conducted by Faccio, and that of the Popular Concerts at Turin, conducted by Pedrotti.

MORIANI, once celebrated as a tenor singer, has just died in Florence, his native town, at the age of seventy.

RUBINSTEIN's opera *Die Makhtaber* was produced at the Vienna Opera at the end of last month. The work is severely criticised by Dr. Theodor Helm in the *Musikalisches Wochenblatt*.

LITERATURE.

Il Moderno Dissidio tra la Chiesa e l'Italia, considerato per occasione di un Fatto particolare, da C. M. Curci, Sac. (Firenze: Fratelli Bencini, Editori, 1878.)

THE interest elicited in wide circles by the report some months ago that a serious difference in opinion had been declared on grave matters between one who long had held so distinguished a position in the Roman Church as Father Curci, and the ruling authority in that Church, will certainly ensure attention for the pages in which the eminent ex-Jesuit has seen fit to explain to the public the views which brought censure upon him and the circumstances under which this was pronounced. The present publication is what the French term a *pièce justificative*—a vindication of a particular line of action taken with reference to a personal incident. It must be read rather as a pamphlet put forth to rebut imputations than as an exhaustive treatise that offers solutions for the many intricate problems involved in the question what should be the relations between Church and State, in the constitution which the latter appears to be definitely adopting under the influence of ideas which seem destined to continue for an indeterminate period in the ascendant. But though thus narrowed in its direct scope, the volume abounds in passages which, as coming from this particular writer, make of this publication a significant sign of the times—the more so from the coincidence between its appearance and the accession to the Chair of St. Peter of a Pope who, there is apparently ground for believing, has not entertained the same uncompromising views which prompted the proceedings that resulted in Father Curci's having to leave the religious body with which he was so long connected. That for many years he has ranked among the most conspicuous champions of the doctrine supposed to be embodied in the Society of Jesus, and powerfully expressed through the *Civiltà Cattolica*, is known to all. As a preacher and a writer Curci has stood before the public as among the greatest lights the Society could show in Italy. To learn, therefore, from his own admission, that for years he had become more and more estranged from the lines of thought and action vehemently insisted upon by the authoritative organs of the Society as incapable of being departed from without a defection from the duty every true Catholic owes strictly to the Church, and to discover that in every instance his difficulties arose out of conflict in his mind between what was being peremptorily demanded by these exacting

exponents of Catholic requirements and what the irrepressible promptings of his Italian heart felt to be due to the civil authorities in possession of his native land, opens up much matter suggestive of far-reaching consequences. The men of Italian birth in the priesthood are not few, and if in one so long and so closely connected with the school of Ultramontane principles as Curci—one whom personal pride might well be expected to indispose to any public declaration in a sense contrary to his antecedents—the fibre of patriotism nevertheless snapped the fetters which it was sought to impose upon the obligations of citizenship, it might fairly be asked whether the same patriotic impulse may not be vibrating with at least the like force in that numerous section of the Italian clergy which is without any marked personal reason, on the score of consistency, for maintaining a defiant attitude towards the secular authorities that are governing. The irrepressible manifestation of the national sentiment by this distinguished Jesuit is what constitutes the striking feature in the present volume, rather than any strictly scientific value or remarkable novelty that can be found in the propositions advanced.

The first two chapters are preliminary. In them are laid down certain general definitions, first as to the quintessence of what, by the principles of the Church, it is absolutely incumbent to accept as of dogmatic force; and then in elucidation of what is really implied by certain formulas that have acquired a large currency. Curci reduces the former to a small compass. "Under any circumstances, when one holds the Apostles' Creed, and abides firmly by it, nothing else is needed of *absolute necessity*." All revealed truths will be found to be mere reproductions of what is in substance in one or other of its articles. The current formula that most prominently engages Curci's attention is that in respect to legitimate authority, and here he at great length combats the "monstrous union" of Catholicism with the political doctrines advocated by Heller, De Bonald, and especially De Maistre, which set up the divine right of absolutism almost as the corner-stone in the Catholic system. "The divers forms of public government being ordained in the designs of the creating Mind for the civil weal of human societies, that one will be legitimate which fitly disposes each to attain that weal under the circumstances in which it is placed." Hence Curci defines sovereignty to be, according to Christian notions, not an absolute "dominion" but a "ministry"—affirming that people have a rightful voice in its constitution, and protests against the "stupendous calumny which would fasten on the Church that hateful *divine right*." After this preface we come to the subject-matter of the tract, "whether or not the opinion must be held a doctrine of the Church which affirms, as beyond doubt or failure, the more or less speedy restoration of the temporal power, as it was before September 20, 1870, with the necessary accompaniment of a dissolution of the present Italian State." Curci is careful to point out that the question of an independence for the Church, in reference to which there are authoritative decla-

rations, is not impugned in the consideration of the proposition, and then dwells with much force on that "audacious and factious current" which is bent with stubborn determination on driving the authorities of the Church into a position of deadly antagonism to the civil government of Italy, and on confirming them in this attitude by a continuance of visionary assurances. "The capital mistake of our so-called Conservatives rests in their having chosen to consider the late Italian revolutions a merely passing tempest, that would subside like many others, whereas these constituted the complement of a transformation in civil society which began with the Treaty of Westphalia." Curci protests strongly against these Conservative utterances being accepted as binding on Catholics. He will not recognise as authoritative the "vague rumours" or "the confidential communications" said to have emanated from the Vatican, that name not being enumerated among the *Luoghi Teologici* by any canonist, the true channel through which Pontifical declarations can be promulgated being the Congregations and the Episcopate.

Curci contends that the Allocution of June, 1862, is the single Papal utterance that at all relates to the Temporal Power, and it he construes into a merely general proposition—not to be disputed—as to an independence essential to the exercise of Pontifical jurisdiction, and necessarily unconnected with the concrete case created by the events of 1870. Nevertheless the "faction" has striven to ascribe to this Allocution a dogmatic meaning in reference to immediate restoration, and has pointed freely to the supposed concurrence in this view of the Italian Episcopate; whereas Curci opines that the silence so steadily observed by so many Bishops on the topic, despite much influential agitation brought to bear upon them, warrants a different conclusion as to their sentiments. The crowning result of this influence has been an abstention from civic duties by believing Catholics which necessarily has thrown into hostile hands the monopoly of government. "That pernicious formula, perhaps the greatest calamity of our country, *Neither elected nor electors*" Curci denounces in earnest words as the fatal legacy bequeathed to the Church by the ascendancy of ignorant and conceited presumption. The sufferings of the Church are ascribed "not to the new institutions in themselves, which, with all their blots, might serve for good as well as they do for evil," but wholly to that "generation of idiots and cowards who, divesting themselves of their privileges, lodge them in the hands of their adversaries to the detriment of morals and of religion, and then presume to style themselves the *Good* and the *Catholics*." Curci demonstrates from history that former Popes, under analogous circumstances of spoliation, never imposed on their subjects the duty of a like attitude, and affirms that no tittle of authoritative ecclesiastical prohibition can be shown forbidding Catholics to fulfil the obligations of citizenship towards a Government, because intruded through an act of forcible ejectment. "If there is, let it be shown," is his confident challenge; while as

for the sentence, "judicat non expedire," freely repeated as having been pronounced in a solemn Decree from a Roman Congregation, in reply to an enquiry on this subject, he gives reasons—and they are weighty—which incline him to look on the statement as a deliberate fabrication.

Among the principal instruments set in motion by the "faction" for influencing opinion, is the establishment of so-called Catholic journals; and Curci is nowhere more strenuous than in his denunciations of the tone and spirit in which these periodicals usurp an air of authority they have no right to claim, preach views that would make their readers traitors to their country, and profusely bespatter all who differ in opinion with vituperations—the term of *Liberal Catholic* being especially used as a stigma of opprobrium.

"It is a fact that at present not one of our great Christian reputations in Italy, whether lay or clerical, has not in some manner been dragged into the dirt or bespattered with it. The double instrument employed for that purpose by this section of the press has been the *Syllabus* and the appellation of *Liberal Catholic*. For what Christian of any renown is there among us (outside the known current) who has not been cast under suspicion of imperfect orthodoxy as to the former, and who has not had fastened on him something of the second as an offensive term."

Of the *Syllabus* Curci's estimate coincides with Dr. Newman's. "It is nothing but a Catalogue or an Index of proscribed propositions, gathered from different documents." Dr. Newman's definition is—"The word *Syllabus* means a collection; the French translators call it a *résumé*. . . . The *Syllabus* is not an official act." The practical consequence of the action pursued by these influences is stated to be an increasing separation in Italy from the Church. "The generation contemporary with the Italian Revolution, or rather the cultivated lay section which, with a small exception, wrought it, was altogether and thoroughly Christian." Curci is of opinion that "at the present day the Italians in their entirety are very satisfied at having an independent and united country," and points in evidence to the absence of active discontent, notwithstanding greatly heavier taxation. Unfortunately the Pope, worked upon by the vehement appeals of fanatics, who made of "restoration a thirteenth article of faith," would not recognise facts, and so did not avail himself of the opportunities offered to "ensure the arrangements which would have been deemed the best for the Church and Italy." The "fatal legacy of misfortunes bequeathed by these noisy champions will not vanish when they have disappeared from the scene," for the feelings of the country are inevitably being estranged by a doctrine which invariably puts forward the dismemberment of Italy through the triumph of foreign arms. The young generation is being more and more repelled by religious influences presenting themselves with such distasteful adjuncts. Curci reduces to infinitesimal dimensions the action of so-called Catholic Associations. To youth, buoyant with spirit and eager for public career, "you offer a Catholicism arranged *ad usum Delphini*, which has for its chief obligations to take no part in the political life of the country—to

stand aside in a small conventicle which awaits the dissolution of Italian unity, with restoration of the temporal power as it was. . . . You offer them as daily bread one of those hideous monstrosities called Catholic journals. . . . I mentioned just now evils which the attempt might effect; unfortunately the attempt has been made, since some time, and the result is exactly what I said—the studious youth have deserted, and are continually deserting, the Church."

The story of the circumstances that led up to expulsion from the Order is told fully in the seventh chapter. They are too long to be given here, and no epitome would adequately represent Curci's case. His statements are distinctly meant to convey that he has been the victim of influences in whose hands Pius IX. was a mere puppet. A point of importance is that the incident which was made the plea for censure at the end of last year occurred as long ago as June, 1875, without it at the time having given rise to reproof. The incident in question was a strictly private communication in writing addressed by Curci to the Pope, explanatory of his views in regard to the policy demanded by the interests of the Church. It is interesting to learn that already, after the battle of Castelfidardo, he had addressed to Pius IX. a memorial in proof that "the false policy of Antonelli would drive on to the final destruction of the temporal power," without this step having then brought on him sovereign displeasure. Even as late as February, 1877, Pius IX. sent Curci his blessing, and assured him of his "ancient favour," in reply to an humble message on the first symptoms of a disposition on the part of certain ecclesiastical authorities to subject him to disciplinary proceedings. The injunction which it was finally sought to impose on Curci went not merely the length of requiring him to abstain from public expression of his opinions on these points of policy (this he was quite prepared to do), but also of refraining to entertain them in private. The account given of the communications received by him from various ecclesiastical authorities, and of the discrepancies between several of their statements, is a curious contribution to the knowledge of the peculiar current which directed and guided the action of the Church in the latter days of Pius IX.

The inference drawn in the last chapter is that society is going through one of those great organic changes which permanently modify its system and impose the necessity of an alteration in the forms of its constitution. The alteration now in course of operation is held to be of a nature that must involve, on the part of the Church, a different position from that which it has hitherto held generally as an establishment. That this fact has not been recognised by the Church authorities is considered by Curci to have been the cause of serious mischief. The essential has been grievously lost sight of in the heat of passion to clutch what was transitory and of merely accidental value. While divine dispensations operating through the medium of secular revolutions were conducting the Church "to a novel external condition, better suited to societies more than half apostatised," the officious representatives of the Church

clamoured frantically for a state of things irretrievably lost. These zealots were blind to the fact that the conditions they wish so much pertinacity proclaimed as indispensable to the proper observance of religion were precisely those under which the hurricane broke on the Church establishment without encountering anything to resist its force. Instead of raising Papal legions which on the day of conflict proved a phantom army, Curci would have had the Church speak in the following strain to the lay community:—"What is done is done, and there is no means to undo it. Let its authors account for it to God! Keep your Italy! keep your power and your treasures! Whenever God chooses to give back to the Church what has been taken from it, He will not want our advice; nor does it seem that for the present He has any wish for our co-operation—every practicable avenue being closed. Keep, therefore, the whole: all we want are your souls, to lead them to Christ."

In Curci's judgment the irresistible tendency of modern society manifestly involves that the Church will have to forego all exceptional privileges, and that its ministers will have to depend for their influence on "the spontaneous reverence of the people for the spotlessness of their lives." That the Church can flourish without intimate association with the State is shown by the prosperous condition of religious bodies in Belgium. Curci also points, in corroboration, to the significant difference in the estimation shown for the priesthood in Tuscany, where the Leopoldine laws sharply circumscribed the position of the clergy, and in the former Papal dominions and the Neapolitan provinces, where those conditions of ecclesiastical privilege prevailed towards the restoration of which, according to the Jesuits, it behoves every genuine Catholic to devote all his energies.

The concluding pages of Father Curci's tract are mournful in tone. The Catholic priest sorrows over the woes done to the Church. The Italian patriot grieves over actions which divorce his country from that Church. That the two might have gone hand in hand toward great destinies is his belief; but now he is no longer hopeful.

"It will be said that this is a dream; if it be a question of the present day, I am not disposed to deny it; but history, a stricter judge than ourselves, will say to our confusion that there was a moment when that dream might have been turned into reality."

And then Curci adds these words—which, now that the event plainly hinted at has actually occurred, acquire a special interest:—

"But then arises naturally this thought: if on the occurrence of a certain unavoidable event that cannot be far off, a change were made in the direction, so as to remove the difference and to convert it into concord, could it then be possible to try something of the kind? The conclusions drawn from what has been stated may supply an answer to the question, and that answer, so far as I am able to see, is sadly and inevitably in the negative."

Must this pessimist prognostication be taken as absolute? Is it really beyond the power of any Pope—be he Leo XIII. or another—any more to effect an understanding with Italy? Such speculative questions are not reducible to demonstration. This much, however, may be said, that if the opinions

entertained by Father Curci are the expression of what has been tacitly held to a considerable extent among the portion of the Italian priesthood educated in the strict school of Jesuit doctrine, then the impediments from within the Church which a Pope disposed towards conciliation would have to overcome are likely to prove less stubborn than might have been anticipated.

W. C. CARTWRIGHT.

The Complete Poetical Works of Percy Bysshe Shelley. The Text carefully revised, with Notes and a Memoir, by William Michael Rossetti. Three Volumes. (London: E. Moxon & Sons, 1878.)

It is less than ten years since an ingenious critic brought forward the persistent neglect of Shelley and Keats by the public as a reason why popularity should be entirely disregarded in estimating the value of a literary product. But it would be difficult for us now to allow that any very heinous neglect has been shown to Shelley, of whom this is at least the fourth edition produced within a decade, and on whom editor after editor lavishes the zeal and erudition that bishops in embryo were wont to expend on Greek tragedians. Keats, it is true, though he seems to sell, lacks as yet an editor; in the last issue I find the same old blunders, Psyche still owning a "soft-couched ear" and the lurking alexandrine not yet expelled from the *Ode to a Nightingale*. But the study of Shelley has become a prominent branch of English bibliography; party spirit runs high in its discussions, and, as in the cult of other classics, the worshippers contrive to extract a great deal of excitement out of their fascinating employment. We may perhaps hope to see the foundation of a Shelley Society, from which, if poets and critics do not gain very much, at least bibliographers may; nor can any one grudge the simple pleasures of controversy to those who so effectually lighten our labours in reading the careless poets. When we reflect how many gentlemen are profitably employed for year after year in clearing up the grammar and punctuation of the great dead, we are apt to consider the carelessness of the illustrious as no small part of the debt that posterity owes them.

In 1870 Mr. Rossetti originally published the edition of which this is the reprint. We should not have considered that the latter called for detailed comment if another very carefully prepared issue of Shelley had not in the meantime professed to supersede the former. Of Mr. Forman's four-volume edition of 1876-77 Mr. Rossetti takes full cognisance; indeed, with a candour that is very characteristic of him, he is careful to pay his predecessor a handsome compliment. In a variety of details Mr. Rossetti has modified his original text, especially in the matter of innovation, in which the general consensus of critical opinion condemned his too great readiness to alter without MS. authority. It has been eminently to the advantage of good scholarship, as opposed to mannerism and prejudice, that two editors so different in aim as Mr. Rossetti and Mr. Forman, agreeing, indeed, in almost nothing but their reverent love for Shelley, should

have had the opportunity of jealously revising each the work of the other. It appears to me that the result is now so admirable in either case that we need not quarrel with one editor or the other because each has a manifest foible. Mr. Forman's weak point is punctuation; he will oscillate an hour between a comma and a semicolon, and the erroneous use of a colon and a dash is almost more than he can bear even from Shelley. Mr. Rossetti, on the other hand, has a soul above stops; but his foible is grammar. His passion for the doubtfully-correct and certainly hideous second person singular of the verb amounts to infatuation. Shelley, like a great many poets and the majority of Englishmen, disliked the grating sound of the clustering consonants, and when it was particularly harsh he dropped the *st*.

"Thou too, O Comet! beautiful and fierce,
Who drew the heart of this frail universe,"

he wrote; whereupon Mr. Rossetti hastens to insert the horrid word *dreust*. But as Mr. Skeat tried in a most luminous paper to impress the needlessness of this alteration upon him, and yet he is still unpersuaded, we must suppose him obdurate on the point, and pass on, merely recording another protest against the Procrustean practice. For my own part I must continue to prefer Shelley wrong to Shelley improved.

These matters are so small, and belong so purely to bibliography, that one almost apologises for mentioning them. The aim of the editor throughout these volumes has been reverential to his author, candid to his critics, patient in investigating every shred of authority, and generous to every helper in the one labour of love. The result is, in short, admirable; and there seems no other word to say about it except to help would-be purchasers by a parallel statement of the excellences of Mr. Forman's and Mr. Rossetti's work. The former, then, is printed more handsomely and with a bolder type, but the latter is less bulky, being in three volumes instead of four. The new edition has the advantage of a full and interesting memoir; the earlier one, however, has ample bibliographical notes, facsimile title-pages, and an index of first lines. The portrait in each is almost equally bad; in Mr. Forman's the look of insanity given by the dilated pupils of the eyes is, perhaps, more marked, but Mr. Rossetti's is more completely maudlin. When is an engraving or etching of the extremely interesting portrait-bust by Mrs. Leigh Hunt, now in the possession of Mr. W. B. Scott, to be given to the public? In the arrangement of the poems Mr. Rossetti retains the old order, and commences with "Queen Mab;" Mr. Forman had the whim to begin with "Alastor." Mr. Rossetti returns to "The Revolt of Islam," and notices "Laon and Cythna" only in his notes, although he interpolates into the former passages of the latter. On the whole it might not be unfair, while warmly commending both editions as admirable contributions to English literature, to say that Mr. Forman's will be more appreciated by students and specialists, but Mr. Rossetti's by the general reader.

Political Economy. A Primer. By W. Stanley Jevons. (London: Macmillan & Co., 1878.)

Political Economy; its Meaning, Method, Limit, and Nature. By Albert S. Bolles. (New York, 1878.)

The Economy of Consumption. By Robert Scott Moffat. (London: C. Kegan Paul & Co., 1878.)

To write a Primer of Political Economy is one of the hardest tasks that could be set to an author acquainted with the differences at present existing among economists themselves, with respect not only to doctrine but to method, to say nothing of the mingled apathy and scepticism of a great part of both the philosophical and the commercial world. The very conception of a Primer seems to involve the assumption that the main principles of the subject can be set forth in a form from which there can be little or no dissent on the part of competent judges. Anything like a controversial treatise, or pure scientific enquiry, or novel speculation, is foreign to the purpose. The author must speak with authority, avoiding doubtful and unsettled questions, and if disputed points must be touched, putting forward his own views with clearness and confidence. Such is the course which Mr. Jevons has adopted, save on one subject, where we shall find him trespassing on forbidden ground. It is not the business of a writer of an elementary manual to sow doubt in the minds of beginners, and Mr. Jevons is quite justified in making no allusion to the two opposite economic schools to which Mr. Bolles, Professor of Political Economy in the University of Boston, in the lecture referred to above, distinguishes as inductive and deductive; schools which the author of the *Economy of Consumption* confounds altogether when he speaks of "orthodox" political economy as "historical." Mr. Bolles himself, while leaning to the inductive and historical method, hardly brings out with sufficient clearness the essential distinction between the two schools. Both, it is true, profess, as he says, to set out with induction, and both make use of deduction. One, however, assumes that the work of induction was finished almost as soon as begun, and, in Mr. Senior's words, that political economy rests on "a few general propositions, the result of consciousness or observation," even those acquired by observation being "nearly self-evident." The other, on the contrary, holds that the economic phenomena discoverable in the history and present state of different nations have never been adequately examined; that some of the most important problems in economic philosophy have hardly been raised, much less solved; and that several doctrines for which the title of laws of political economy is claimed by the deductive school, are empty abstractions, others hasty assumptions or inaccurate generalisations.

An interesting and instructive subject to which Mr. Jevons refers illustrates the distinction between the two schools. "The most important law of political economy is," he says, "the law of variety" in human

wants, adding that "there is a natural order in which our wants follow each other as regards importance." "We can lay down roughly a law of succession of events somewhat in this order—air, food, clothing, lodging, literature, articles of adornment and amusement." Mr. Jevons here touches on one of the most fruitful enquiries in the field of economic research, but it is one on which no light is thrown by abstract and *a priori* political economy. Adam Smith, indeed, who never forgot the facts of history and life altogether, though speaking generally of "the desire of every man to better his own condition" as the principle governing the movements of the economic world, also alludes to a natural succession of human wants for food, clothing, lodging, furniture, ornament, and equipage. Mr. Senior, too, catching the idea from Adam Smith, had a glimpse that "the general desire of wealth" which he calls "the first elementary proposition of political economy," is after all only a name for a variety of desires, in which law and order or succession are traceable. But it could be shown that the wants determining the employments and productions of mankind differ in different societies and states of civilisation, and that one of the principal paths of economic investigation has been left hitherto almost unexplored, although some remarks in Mr. Mill's treatise show that it had not escaped the attention of his profound and penetrating mind.

Mr. Jevons and Mr. Moffat have few economic principles in common, and their works differ as much in quality as in quantity; yet both where they differ and where they agree, they may be read together with advantage. Had Mr. Moffat studied Mr. Mill's *Political Economy* as a whole, instead of picking out sentences here and there for attack, he might have spared himself and his readers many pages of tedious controversy. Capital, for instance, he insists, is not the result of mere abstinence from unproductive consumption or parsimony, but also of labour and production. Mr. Mill has said the same thing in the clearest terms in his chapter on the increase of capital. But abstinence, saving, and similar terms, are sometimes used by Mr. Mill, as by Mr. Senior and Mr. Jevons, for brevity, in an active sense, to include work for remote results. Economy of speech and the poverty of language sometimes render such ellipses necessary. It is nevertheless illogical and inconvenient to include under the term capital forces so different, and producing revenue governed by such different laws, as the powers of the labourer and natural agents like land; and we recommend to Mr. Moffat's attention some remarks in Mr. Jevons's *Primer* on that point. Mr. Jevons himself, however, seems to us to fall into some inaccuracy in saying that "the capital invested in any work may be said to consist of wages or what is bought with wages;" and that "when we go far enough back, we always find that the capital invested consists of the maintenance of labour." The question here involved has many important ramifications, and lies at the root of several controversies, among others one which Mr. Moffat revives by assailing Mr. Mill's proposition that the purchase of commodities by the rich is not

equivalent to the payment of their price in wages to labourers; or, to use Mr. Mill's own formula, that a demand for commodities is not a demand for labour. Mr. Jevons here takes up a position between Mr. Mill and his opponents, but nearer the latter. "Demand for commodities," he says, "comes nearly though not quite to the same thing as demand for labour. There is the profit of the capitalist to be considered as well." The element of profit in fact forms a large part of the price of many commodities, and Mr. Jevons further on (*Primer*, p. 64) lets in another element, namely rent. There is, therefore, Mr. Jevons must admit, some laxity in saying as he does that "it does not much matter whether we speak of demand for goods or demand for the labour which is necessary to make the goods." Mr. Jevons puts the case of the purchase of barometers. People who buy them "do not pay the workman for making them. The capitalist advances the wages for a few weeks or months." It really matters very much to the capitalists selling the articles, to the builder and owner of their shops, and to the ground landlord, to get their profit and rent out of the price of the barometers sold in the Strand. The capitalist sometimes advances the wages and other outgoings not for "a few weeks or months" only, but for years before the sale of part of his stock, and his profit forms a proportionate part of their price. Nor are rent and profit the only elements besides wages in the price of commodities. The food of animals, the seed and dressing of the ground, the coal, oil, material, &c., used in factories, do not go to the labourer. There would have been less outcry about enclosures in the sixteenth century had the demand for wool to be exchanged abroad for luxuries for the landlord fed men instead of sheep. If, indeed, all the funds spent by the upper and middle classes on commodities for their own use were virtually spent on the working classes, the latter would enjoy the whole aggregate national income. The actual proportion of the price of commodities to be set down to wages has been a subject of statistical investigation in several countries, and the results show that labourers get a much smaller share than is generally supposed. At every stage of the process of production, from the growth of the raw material to the manufactured article, labour no doubt gets a part; but capitalists, landlords, government, national creditors, animals, and even inanimate agents (as, for instance, when coal is consumed by machinery), also receive their parts. There is a curious connexion between the fallacy of the German social democrat, that everything is produced by labour, and therefore the labourers should get all the produce, and the doctrine which assumes so many forms in this country, that all the expenditure of the rich on commodities is spent upon labour. Labour, in fact, is not the only productive agent, and the other agents, down to the animals and the machines, require a share of the produce, or its price, for their own recompence or maintenance.

Mr. Jevons is silent in his *Primer* respecting the doctrine of a "wages-fund," but we

know from another work that his silence does not imply assent; and it is satisfactory to find that equally misleading phrase, "the average rate of wages," conspicuous by its absence in the *Primer*. It is, we think, to be regretted that he has not also discarded the term "real wages." Distinguishing between money wages and real wages, he says that

"what a labourer really works for is the bread, clothes, beer, tobacco, and other things which he consumes; these form his real wages. If he gets more of these, it does not matter whether he gets more or less money wages. On the other hand, everything that makes goods cheaper increases the real wages of workmen, because they can get more of the goods in exchange for the same money wages."

The truth is that the term "real wages" is appropriate only to the relatively early industrial stage at which the labourer is fed, clothed, and lodged by his employer, and forms part of his household. The quantity and quality of the commodities received by the former then depends on a single exchange between labour and capital. At a more advanced stage the labourer's real income depends also on a whole set of other exchanges, governed by distinct conditions. Two workmen may earn the same money wages, yet the real income of the one may be rising while that of the other is falling, because they spend their money on different articles. Mr. Jevons is quite right in teaching the working classes to look to the cheapness of commodities, and therefore to the productiveness of their own labour, as materially influencing their condition. Nevertheless we cannot admit that "a real increase of wages to the people at large is to be obtained only by making things cheaply." The price of cloth, corn, and all the necessities and common comforts of life might be low, and yet through over-population, or a demand on the part of other classes for other things rather than labour, the working classes might be on the verge of destitution, and many of them actually starving. Mr. Senior, looking only to the amount of food, argued that absenteeism could not be injurious to a country like England, which does not export raw produce. He overlooked the fact that labourers will not get food, clothing, or anything else, unless they can pay for it; and that the greater part of the food in the country, not consumed by other classes, may go not to working men, but to horses, dogs, and other animals.

Mr. Jevons and Mr. Moffat both hold that it may be good policy on the part of workmen to combine to limit the hours of work, but that they ought not to combine to control the rate of wages. It cannot, indeed, be denied that sometimes only employers can know what is the highest rate the state of their business will afford, while the men are often mistaken about it. But it does not follow that the employers are willing to give the maximum; and if they could take the men one by one, offering the alternative between a bare subsistence or nothing, they might keep the rate at a minimum, as the farmers in many southern parishes did for more than half a century before agricultural unions were formed. Mr. Jevons pronounces the notion of some working men, that em-

ployers dealing with labourers singly may give what wages they like, "altogether a mistake. No capitalists can for more than a year or two make enormous profits, because if they do, other capitalists are sure to hear of it and to try to do likewise;" so that the competition for labour will increase and its price will rise. But profits vary in different years, and if the labourers get no better pay in the "year or two" when employers are perhaps doubling their capital, they may always get only the rate obtainable in years of low profit. Neither does it always follow that low wages cause high profits, and thus attract fresh capital into the business, for employers may be slack and unimproving, as English farmers were a few years ago in several counties, in a great measure on account of the low price of labour. But the equality of profits is a mere fiction of economic theory. The present state of trade refutes the assumption on which it rests. Instead of accurately knowing the relative profits of all the different trades in the country, capitalists are often surprisingly ignorant of the conditions and prospects of their own trade. They knew nothing of what was before them three years ago, and they know nothing more of what is before them three years hence.

Mr. Moffat urges that what he calls "a time policy" on the part of labourers—that is to say, union on their part to limit the hours of work without interfering with the rate of wages—will "at once and finally abolish strikes." "If the demand by labourers to fix the hours of labour be resisted, the resistance will lead, not to a strike, but to a lock-out." Surely it comes to the same thing in the end. Suppose the men refuse to work longer than nine hours a day, and the employers offer only a shilling—let us say—for the nine hours, will it help the labourers to say that, if they refuse these terms, it is not a strike but a lock-out? Mr. Moffat actually conceives that his "time policy" will prevent over-population.

"It is impossible that a country in which the hours of labour are moderate can be oppressed with population. . . . With the increase of leisure a higher standard of taste and social refinement will gradually extend itself among the working classes, and will raise the scale of domestic comfort demanded by them as a condition of marriage."

The clergy have plenty of leisure, yet they are commonly as imprudent about marriage and large families as the hardest-worked labourers. A labourer, too, often reasonably looks on children as worth more than their keep by their earnings. It is other people's children, not his own, that make life so hard for him and his.

Mr. Jevons leans to the method of the deductive school in political economy; and those who think it inadequate have no right to complain if one of its ablest expositors chooses to write an elementary treatise. But he does give just cause for complaint when he imports into it, as one of the truths of political economy, a mere speculation to which few economists of any school of the least note have avowed their adhesion, as he has done in his chapter on "Credit Cycles."

His own language is enough to show the purely conjectural character of his doctrine on this subject:—

"There is a kind of tide in business which usually takes about ten years to rise and fall. The cause of this tide is not well understood; but there can be no doubt that in some years men become confident and hopeful. . . . This state of things, however, cannot go on very long; . . . discredit spreads; . . . there is a falling-in of prices, credit, and enterprise, called a crisis. . . . It would be a very useful thing if we were able to foretell when a crisis was coming; but it is evidently impossible to predict such matters with certainty. All kinds of events—wars, revolutions, new discoveries, treaties of commerce, bad or good harvests, &c.—may occur to decrease or increase the activity of trade. Nevertheless, it is wonderful how often a great commercial crisis has happened about ten years after the previous one. During the last century there were crises in or near the years 1753, 1763, 1773, and 1793. In this century there have been crises in the years 1815, 1825, 1836-9, 1847, 1857, 1866; and there would probably have been a crisis in 1876 or 1877 had it not been for an exceptional collapse in America in 1873. . . . Sometimes the cycle lasts only nine or even eight years, instead of ten; minor bubbles or crises sometimes happen in the course of the cycle to disturb its regularity."

By Mr. Jevons's own admission, the alleged cycles have no known cause or law; and the most different events, wars, bad harvests, revolutions, treaties of commerce, which are not themselves periodical, determine the close of the "cycle." But, in fact, it is only by picking and choosing "crises," and lengthening and shortening "cycles" with Procrustean tyranny, that even a superficial appearance of decennial periodicity can be made out. Sir Robert Peel, in his speech on the Currency Bill of 1844, said there had been four crises in the twenty years previous, namely, in 1825, 1832, 1837, and 1839. Some years later Mr. Tooke insisted that there had been only four true years of crises in the sixty years preceding, namely, 1792-3, 1810-11, 1825, and 1847. On the other hand, in 1847 there were, according to him, two distinct panics, one in the spring caused chiefly by the bad harvest of 1846, and one in the autumn caused chiefly by the fall of prices consequent on the better harvest of 1847. According to other authorities there were crises in all the following years, 1793, 1795, 1810, 1811, 1816, 1825, 1836, 1837, 1839, 1840, and 1847. Mr. Jevons says:—

"It seems probable that commercial crises are connected with a periodical variation of weather affecting all parts of the earth, and probably arising from increased waves of heat received from the sun at average intervals of ten years and a fraction. A greater supply of heat increases the harvests, makes capital more abundant, and helps to create the hopefulness out of which a bubble arises. A falling off in the sun's heat makes bad harvests, and deranges man's enterprises. This is likely to break the bubble."

This is an interesting speculation, but unfortunately for it there is complete historical proof that good and bad harvests in England follow no regular periods. The fifty years from 1715 to 1765 were characterised by a remarkable exemption from seasons of scarcity compared with the fifty years before and the fifty years after. And Mr. Tooke has shown that the chief cause of the high range of prices from 1793 to 1814 was the frequency

of bad harvests; while from 1818 to 1837 there were only five deficient seasons. Mr. Jevons himself too allows that many other causes besides bad harvests, to which it is impossible to attribute periodicity, may bring on a crisis.

Mr. Moffat's chapters on competition deserve study, but we cannot commend his work as a whole, and if any economic fallacy could now surprise us, we should be astonished at some that it contains. The arrogance and discourtesy of his language towards eminent authors from whom he differs shows an absence of judgment and discretion, to speak of nothing else, ill fitting him for the task he undertakes, "not merely to discuss theoretical doctrines, but to establish a sound practical basis for a healthy development of industry." He accuses Mr. Fawcett of "incapacity to comprehend the principles of political economy or of human nature." To Mr. Mill he is equally disrespectful. The manner, indeed, in which that illustrious philosopher has been depreciated since his death by a crowd of obscure writers can only be accounted for by a profound conviction on their part of the truth of the proverb that a living dog is better than a dead lion.

Mr. Bolles's interesting lecture is disfigured by some ugly and misleading misprints, but one cannot wonder that a writer who is at once the editor of a daily and a weekly paper, a Professor of Political Economy, and preparing for publication an Industrial History of the United States, should have small leisure to correct the press.

T. E. CLIFFE LESLIE.

Pensées of Joubert. Selected and Translated, with the Original Appended, by Henry Attwell. (London: Macmillan & Co., 1877.)

MR. MATTHEW ARNOLD once remarked that Joubert was almost unknown in England. That statement, thanks very much to Mr. Arnold himself, is now no longer true. But it is still true that Joubert is an author very much more quoted than read, and it may be shrewdly suspected that when he is read it is very often for the purpose of quotation. In these days it is exceedingly rare for anything to be read the reader whereof cannot meanwhile run, and the reader of Joubert can only run at his peril. He may take in the outside—the mere epigrammatic sparkle of the thought—but he will assuredly miss much, if not all, of its inside, unless he is prepared to give it a long and leisurely digestion. Were it for nothing else, these *Pensées* would be a useful alternative for the general English reader, and in supplying some of them in a form which the merely English reader can take, Mr. Attwell would have done a good work. But the goodness of the work becomes still greater when one considers the enormous intrinsic value of the material thus made available. It is quite a safe assertion respecting Joubert that he hardly ever goes wrong when he speaks with the requisite knowledge, and that without the requisite knowledge he very rarely speaks at all. Even where his knowledge is not fully adequate a sort of instinct guides him aright,

in the same way as it was said of Goldsmith that with hardly any knowledge he has written a better History of Rome than nine-tenths of his learned competitors, simply because, though he knew Romans little, he knew men well. Joubert, for instance, was, it appears, ignorant of our own language, which, with Greek, must always be an almost indispensable equipment to anyone who shall speak of poetry with authority. During the whole period of his life there was no sound theory of poetry in France, and only towards his death were there any symptoms of sound practice. Yet his aphorisms on poetry are among the most adequate as well as the soundest sayings on the subject which have ever been committed to writing.

Of the nearly two thousand *Pensées* of the original, Mr. Attwell has selected for translation rather more than four hundred. His translations are on the whole very successful, though, as was unavoidable, he has made a few mistakes. We do not speak of instances where there may be a doubt as to the best version. For instance, Mr. Attwell keeps the literal order in rendering

"La tendresse est le repos de la passion"

by

"Tenderness is the repose of passion."

We should prefer

"Tenderness is passion in repose."

But this is a matter of taste. It is not so with the following. Mr. Attwell has (*Pensée* 119) :—

"Evil-speaking is malignity's balm."

Now, having read this, and at the moment not having the original in mind, we confess that we could make neither head nor tail of the meaning, which as the words stood appeared to suggest some Achilles'-spear faculty on the part of the ill-natured. We turned to the French, which is clear enough :—

"La médisance est le soulagement de la malignité."

That is to say :—

"Evil speaking is the way in which ill-nature relieves itself."

There are, however, but few errors of this sort, and the general rendering is good and adequate. Mr. Attwell, in a note, has expressed the difficulty he feels in finding an equivalent for Joubert's "*Liberté*." With an Englishman's usual fetish-worship of the words liberty and freedom he does not like to use either of these sacred expressions, and yet one of these is what Joubert meant and nothing else. This is not the place to enter into a discussion of Joubert's Toryism, for which Mr. Arnold has already done vicarious penance to the insulted majesty of English politics; but it may be said briefly that it was a Toryism as decided as anything could be, pushed back to its very simplest terms, and resting on certain primary convictions and tastes, which may be held or denied but cannot be argued about.

We will give a few specimens of Mr. Attwell's setting of his gems :—

"Nothing which does not transport is poetry. The lyre is a winged instrument."

"The poet's subject should present to his genius a kind of fantastic resort" ["region of fantasy" we should prefer] "which he can expand or contract at pleasure. Places that are too real, and

persons that are too historical, imprison his mind and cramp its movements."

"A serious urbanity is the characteristic of the academic style. It alone is suited to a literary man addressing lettered readers."

"A work of art must not have the appearance of a reality, but of an idea."

"History needs distance, perspective; facts and events that are too well attested cease in some sort to be malleable."

"Taste is the literary conscience of the soul."

These are but a few specimens taken from one or two only of the headings; but they will all the better serve to show the substance of the book to those who are as yet unacquainted with it. Certain we are that few people who are by nature fitted to appreciate such work will read this book without a desire to extend their knowledge of the original; and this we are sure Mr. Attwell will pardon us for saying seems to us the greatest merit of the translation. It is extremely well got-up, and the inclusion of the French should make it a desirable book to many who do not need the English version. It is preceded by a short but sufficient Life of Joubert, and by some extracts of criticism taken from the last French edition. Lives of authors are not always very necessary or helpful to the due appreciation of their works, but this cannot be said of the brief history of a man who had, in Madame de Châtenay's words, "*l'air d'une âme qui a rencontré par hasard un corps et qui s'en tire comme elle peut*," and the excellence of whose work was almost equally in consequence and in spite of his physical ailments. Perhaps Mr. Attwell will some day give us a further selection, for there is nothing in the original which does not deserve the labour richly, and there are few literary exercises more attractive to the performer than the translation of these maxims, which require as much care as poetry, but are free from the hopeless task of combining the demands of faithfulness and poetical excellence. Whether he does this or not we wish his present sample a wide circulation. Some benevolent and sagacious person might very well distribute a few hundred copies of Joubert yearly to sixth-form boys after the fashion of Sir Henry Peek's School Board Bibles. Lord Chesterfield would have made a similar suggestion, substituting *La Bruyère*, but the present age needs Joubert rather than his literary ancestor.

GEORGE SAINTSBURY.

The Life of John Milton, narrated in Connexion with the Political, Ecclesiastical, and Literary History of his Time. By David Masson. Vols. IV. and V. (London: Macmillan & Co., 1878.)

PROF. MASSON has so accustomed us to connect his name with the results of untiring industry that the reader of his last two volumes may perhaps be inclined to take the hard work which he has gone through as if it were not something altogether unusual. Yet it has only been through a process of minute and laborious investigation that the author has been able to set before us, week by week and almost day by day, a narrative of the actions, and often of the thoughts, of the subject of his biography, a narrative which to many will appear to enter so far

into detail as to obscure the main lines of character, but which, at all events, furnishes the student with the means of reconstructing the picture for himself.

Milton's career has, indeed, been too long before the world to enable any writer, however painstaking, to discover anything which will much modify our opinion of him. Prof. Masson's chief discovery (iv., 327) is evidence—which, however, with praiseworthy caution he refrains from pronouncing entirely conclusive—that Milton was a writer of leading articles in Needham's *Mercurius Politicus*. Besides this, the main interest of the volumes, so far as the biography is concerned, lies in the story of Milton's relations with Cromwell—relations which began in the highest admiration, but which, without ever being entirely broken off, were certainly becoming strained before the end of Cromwell's career. Milton, in short, was the idealist of the Commonwealth, the Rupert of the intellectual battle, plunging on in his headlong career, careless how his followers were quitting themselves behind him. It is possible that in later years his physical blindness may have made him more insensible than before to the practical needs and hesitations of the world around him, but the fault was one which was inherent in his nature and too closely allied to his higher virtues to be easily separable from them. Cromwell, on the other hand, was on the field of political struggle exactly what he was on the field of battle, ever ready to draw rein at the necessary moment in the midst of the fiercest charge, ever ready to take into account all the circumstances of the fight around him, as well as the immediate obstacles which he was facing at the moment. Hence the growing conservatism of his ecclesiastical policy, and his efforts to recover his base of operations in an established Church, while Milton was advancing in pursuit of an ideal system in which State support to religion would be entirely unknown.

A mind like Milton's would be certain to be tolerably indifferent to the persons to whom he gave his adherence except so far as they were likely to help him to realise the ideas which he cherished, and there is therefore no cause for astonishment in the discovery that when the Rump Parliament was restored by the army after the expulsion of Richard Cromwell, Milton, expecting far more for his darling project than he had been at all likely to obtain from either Protectorate, forgot the lower character of its members in their higher, and hailed them as "next under God the authors and best patrons of civil liberty that ever these Islands brought forth," "the care and tuition of whose peace and safety," he goes on to say, "after a short but scandalous night of interruption, is now again, by a new dawning of God's miraculous Providence amongst us, revolved upon your shoulders."

Undoubtedly, these are strong words, and it therefore is worth while to ask whether Prof. Masson's explanation of them is sufficient.

"Is not," he asks (v., 606), "the Address also a recantation of Oliverianism? To some extent it must be so interpreted. It seems utterly im-

possible, indeed, that the phrase 'a short but scandalous night of interruption' was intended to apply to the entire six years of the Cromwellian Dictatorship and Protectorship. That had not been a 'short' interruption, for it had exceeded in length the whole duration of the Commonwealth it had interrupted, and it would be the most marvellous inconsistency on record if Milton could ever have brought himself to call it 'scandalous.'

Prof. Masson, in short, interprets the scandalous night as "the fortnight or so of Wallingford-House usurpation which broke up Richard's Parliament and Protectorate."

The best interpreter of Milton, however, is Milton himself; and it is clear that at this date he permitted himself to speak of the Oliverian time as a mere interruption of good order. His feeling about the members of the Rump is clearly expressed in his congratulations on its having been brought

"to confess in public their backsliding from the good old cause, and to show the fruits of their repentance in the righteousness of their restoring the old famous parliament, which they had without just authority dissolved." (*Letter concerning the Ruptures of the Commonwealth.*)

Or, again:—

"It is true that when the monarchy was dissolved, the form of a commonwealth should have forthwith been framed, and the practice thereof immediately begun; . . . we had been then by this time firmly rooted, past fear of commotions or mutations, and now flourishing; this care of timely settling a new government instead of the old too much neglected hath been our mischief. Yet the cause thereof may be ascribed with most reason to the frequent disturbances, interruptions, and dissolutions, which the Parliament hath had, partly from the impatient or disaffected people, partly from some ambitious leaders in the army; much contrary, I believe, to the mind and approbation of the army itself and their other commanders, once undeceived, or in their own power." (*The Ready Way to Establish a Free Commonwealth.*)

If these words do not, in part at least, apply to Cromwell, it is hard to say what they mean. Yet it would be most unfair to infer that Milton was a time-server. He was simply an unpractical political idealist, caring for persons and forms of government only so far as they seemed likely to effect the object which he had in view.

A reviewer is tempted to dwell the longer upon the biographical portion of Prof. Masson's work, because the historical portion is very far from being equal to the demands of the reader. We get, indeed, some lists of persons and sketches of events, which, though they make very little show, must have cost the compiler an immense amount of pains, and which will save an equal amount of pains to those who follow in his footsteps. Here and there, too, we have such admirable pages as those in which the history of the campaign in Scotland which preceded the battle of Worcester is made clearly intelligible. But, it must be said with regret, Prof. Masson neither cares for the history of this country as a whole, nor does he know how to tell it as it should be told. The period which he has attempted to cover in these two volumes, reaching from the execution of one king to the restoration of another, is one of the noblest themes which an historian can have. Of Cromwell's greatness Prof. Masson is fully cognisant. Why cannot he enter into the causes of the limitations of his greatness?

Why are the Protector's opponents to be treated as if they were not worth taking account of? Why, for instance, is Ashley Cooper and his championship of Parliamentary institutions to be passed over with so brief a notice? Why is Jeremy Taylor and his plea for the Liberty of Prophesying to be almost contemptuously flung aside? The movements which these men embodied grew to be the victorious causes of the next generation, and were powerful for good or for evil when the names of Milton and Cromwell were regarded with execration. The historian may justly claim to have his preferences, but he may make no exclusions. He must take account of all the forces by which society is influenced, and this is precisely what Prof. Masson deliberately refuses to do. He can only speak disdainfully when he refers to (iv., 306) "the so-called 'interregnum,' that period of mainly Republican management which English scholarship and the lazy general mind, saturated as they are with the Clarendonian tradition, have agreed to regard as historically unrespectable." As if there were not those who are neither lazy nor Clarendonian, who see that these years, with all their greatness, were interpolational as well as interregnal, and who, without bating one jot of their admiration of Cromwell's character, cannot blind themselves to the truth which has been once more enunciated by Mr. Lecky in his recent work:—

"The more the qualities of the man are exalted, the more significant are the lessons of his life. Despising the national sentiment of loyalty, he and his party dethroned and beheaded the king. Despising the ecclesiastical sentiment, they destroyed the Church. Despising the deep reverence for the constitution, they subverted the Parliament. Despising the oldest and most cherished customs of the people, they sought to mould the whole social life of England in the die of an austere Puritanism. They seemed for a time to have succeeded, but the result soon appeared. . . . The hated memory of the Commonwealth was for more than a century appealed to by every statesman who desired to prevent reform or discredit liberty, and the name of Cromwell gathered round it an intensity of hatred approached by no other in the history of England" (*History of England in the Eighteenth Century*, i., 120).

This is the plain state of the case, and to write the history of the period without keeping it full in view is to refuse to do more than to write so much of the history as may concern a special set of men.

It may perhaps be thought too exacting to ask for a wider basis of evidence than even Prof. Masson's industry has accumulated. But it is certain that a historian who omits to use the despatches of foreign ambassadors except so far as they are to be found in print deliberately cuts himself off from sources of information which he can ill spare. What a light, for instance, is thrown by the letters of the Venetian Pauluzzi—which lie waiting for examination at the Public Record Office—upon the state of feeling between the army and the Parliament just before its dissolution by Cromwell. On April 17, for instance, Pauluzzi writes as follows:—

"Lately there has been a great conflict in words between General Cromwell and a principal Par-

liamentarian. When the former said something about the renewal of the Parliament, the latter replied that there was no time better than the present for changing the General of the army, so that hard and fierce words were exchanged between them, to which an end was put by the greater number of those present."

One would like to know whether the principal Parliamentarian was, as he may well have been, Sir Harry Vane. At all events, such scenes as these help us to understand the course of events far better than we shall ever do from the greater part of the utterly unimportant matter which Prof. Masson has so sedulously chronicled.

One other extract must be given as illustrative of the manner in which Prof. Masson fills his volume with entries which are useful just as the entries in a calendar of State Papers are useful. At p. 377 of vol. iv., he gives us about five pages of biographical matter relating to all the foreign ambassadors residing in London at a particular date. Among these the following paragraph occurs:—

"ITALIAN STATES:—Since the 15th of May, 1651, the recognised agent in London for the *Grand Duke of Tuscany* had been AMERIGO SALVETTI, living in Great St. Bartholomew's; and there was occasional business between him and the Council of State, with new letters from the Grand Duke himself, through the rest of that year, and the whole of 1652."

"What on earth does this matter?" will probably be the cry of the weary and uninitiated reader. To the reader who has been behind the scenes, there will come a feeling of bewilderment that this is all that is to be said of the writer of those weekly news-letters which, not since 1651, but since 1616, pour such a flood of light upon the details of English affairs. As an ambassador Salvetti was not distinguished. But the prospect of having to pick up the thread of affairs without the jottings of the indispensable Salvetti to help one, is indeed dismal, and it is at least a comfort to be assured that he was still to be heard of in 1652.

After all, however, it is impossible to close the volumes without warm thanks to Prof. Masson for the work which he has accomplished. If he has not written a history of England, or even in the highest sense a biography of Milton, he has prepared invaluable stores for others to use. Steadiness of purpose, honesty of aim, and stern abhorrence of the very appearance of falsehood, are not such common things that we can afford to be indifferent to their appearance because they are not accompanied by other qualities which we should also value. May we in conclusion express a wish that the final volume may end with the fullest and most accurate of all possible indexes. This is a work which more than most needs such assistance to reveal its treasures. A merely tolerable index would be hardly of any use at all. That an index should be merely tolerable "*non Di, non homines*:"—unfortunately experience forbids us to add "*non concessere columnae*." SAMUEL R. GARDINER.

Hilda; among the Broken Gods is the title of a new poem by the author of *Olrig Grange*. It will be issued immediately by Mr. Maclellan, publisher to the University of Glasgow.

NEW NOVELS.

Guilty or Not Guilty? By Major-General W. G. Hamley, late of the Royal Engineers. (Edinburgh and London: William Blackwood & Sons, 1878.)

Cousin Deborah's Whim. By Mary E. Shipley, Author of "Gabrielle Vaughan," &c., &c. In Three Volumes. (London: Samuel Tinsley & Co., 1878.)

Regent Rosalind. By the Author of "The Wynnes," "Work-a-Day Briars," &c. (London: Samuel Tinsley & Co., 1878.)

Winnie Travers. By Anna Lisle (Annabella Crawford), Author of "Self and Self-Sacrifice," "Quicksands." (London: Groombridge & Sons, 1878.)

THE first volume on our list has for its author the brother of the writer of *Lady Lee's Widowhood*. His story may present some claims to originality, both with regard to what it tells and what it leaves untold, and is not without considerable traces of cleverness; but it must be confessed it is somewhat unpleasant in character. It deals for the most part with vulgar and odious people, who have barely the merit of interesting the reader, while those who are meant to be virtuous and respectable members of society are inanely weak and silly. In some respects the first chapter, "Gossip about the crime," is the best in the volume. The pictures of the respectable grocer toiling up the hill on a summer's evening, "sensible of the heat," hat in hand, frequently wiping his brow; and his subsequent talk with his pastor, whose pleasant homely wife is perhaps the brightest bit of colour in the book, are natural and interesting. Their talk is of a confession by one of their sect of a murder for which a man has been already executed. The history of that crime is told in the narrative which follows. What becomes of the real criminal who rushes from church into the presence of the Secretary of State and obtains a reprieve for the condemned man which arrives too late to be of use, we are not told, nor in truth do we very much care. The only satisfaction we have is that the man who was hanged by mistake certainly deserved his fate, though not for that particular crime. Three more unpleasant youths than those whose school life is sketched in the earlier chapters, it has not been our fortune to meet. It may be that there are people in this world as weak and silly as Mrs. Maine and her daughter Patty, but it is hardly conceivable that a shrewd elderly man of business like Mr. Bateman, whose young wife has just given him a letter from her discarded and disreputable lover, full of endearing terms towards her and insults towards himself, should insist on going to meet the rascal with a present of the money for which he impudently asks. The stories told by Mr. Stubbs at the Gritvale Corporation dinner are not bad as after-dinner narratives, and look very much as if they had been heard by the author. As the living voice and surroundings are, however, necessarily absent, they fall somewhat flat and are too evidently pitchforked into the novel, which notwithstanding its faults is readable, and that is more than can be said of the others of our "batch."

The authoress of *Cousin Deborah's Whim* has apparently most conscientiously and consistently devoted considerable time and pains to its composition. For a few hours each day—Sunday probably excepted—she appears to have set herself to the task of constructing a plot, making up conversations, and describing croquet parties and pic-nics. There is no spontaneity about her performance, and if it was a task for her to write it, of which it bears some traces, it is no less a task for the reader to wander through it. *Cousin Deborah's Whim* is to adopt the orphan child of a collier, who grows up into a very terrible young woman, and who surely is the incarnation of all the ill-tempered and forward brats the authoress has ever met. On the first occasion on which *Cousin Deborah* finds fault with her, she shuts herself up in her room, and in the early morning lets herself out of a window and sets off to London. Arriving there, she does not become a waif or "go to the bad" as such a naughty girl might be expected to do, but develops all of a sudden into a governess, with wonderful powers of command and keeping order among children only a little less objectionable than herself. She goes from situation to situation, and the story is little more than a record of dreary conversations and equally dreary incidents. Finally she receives an "offer," a word of which the authoress is fond, which is, however, instantly withdrawn on her confession of her origin. An aunt, drunken and debauched, appears on the scene, and *Thyrza's*—for such is her name—whim, in turn, is to go and live with this disreputable pedlar, who speedily drinks herself to death. How she in the end comes to make some slight atonement to *Cousin Deborah*, who is the best character in the book, will be discovered by the patient reader in the sequel.

In *Regent Rosalind* we reach a yet lower depth, for in it there is no redeeming character such as *Cousin Deborah*. There are people who derive amusement and edification from seeing the beasts fed at the Zoological Gardens, and there may be readers who like to see the characters in a story "feed." If there are such, let us commend them to *Regent Rosalind*, for there feeding goes on in all places, and after diverse manners, from morning to night. Almost every chapter commences by recording a conversation round the breakfast table. As we turn over the leaves, we seem to hear a perpetual ringing of some meal bell. There is a pervading odour of ham and egg about the book. Silly speeches are constantly being made, as "he carved the fillet of veal before him;" as "he carved the ham;" as "he helped himself to mustard." Frequent demands are made for "some more meat, please;" "some more potato, will you?" Polite offers are numerous: "Let me give you some butter, sir;" "May I hand you a cup of tea or coffee?" The personages of the story spend their time in bringing up empty cups and handing cake and fruit. One young lady is found lying on the floor in a state of exhaustion from want of her supper. Even in the love-making an allusion to tea cannot be dispensed with: "whereat Mr. Becker-

stiffe stole his arm around her and kissed her; and to think it was not yet eight-and-forty hours since he had most ceremoniously handed her that cup of tea." Resentment is caused in the breast of a husband because some neighbours have not asked his wife to more than "tea and croquet." Young ladies who are troubled with "aching sides" will be glad to hear of an infallible remedy—a "cosy comfy coze" with another young lady upon a sofa. All this is simply weak and silly, but surely it reaches something worse when a silly, gushing girl is allowed to speak thus:—

"*Via crucis, via Lucis,*" she murmured, she scarcely knew why; 'I am glad his gift is this—no silly ring or locket; *this* I can wear, and out of sight. Oh, surely, when *Christ Himself* deigns to call the Church His Bride, married life must be the better life even for us sinful men and women."

Let us hope that the writer of *Regent Rosalind* will take the advice which one of her characters gives to another in regard to that beverage, tea, which plays such an important part in this remarkable story, when she exclaims, "Now do leave dispensing that wishy-washy mixture."

The greater part of *Winnie Travers* appears to be intended for young people. A large portion of it consists in the narration of the vagaries and tricks, not always of the most polite order, of a brother and sister, and the chronicle of their rebellions against the authority of an elderly maiden aunt. Among the practical jokes with which these young people amuse themselves and torment other people are the concealing of the aunt's "front" in the ladle which the curate innocently dips into the soup, and the serving up to breakfast a live kitten which the aunt supposed had been drowned. If overdone, the first part of this story is clever and bright, though the curate's proposal to the child-niece and subsequent marriage with the aunt is surely improbable and absurd. *Winnie* goes through rather a sad process of taming, settles down as a very proper young lady, and finally becomes the rector's wife. W. W. TULLOCH.

NOTES AND NEWS.

WE are glad to hear that Mr. W. R. S. Ralston is convalescent after his severe illness in Paris, and has now returned to London.

MR. THEO. MARZIALS has lately been made a member of the Παναρσός, the leading literary society of Athens, whose periodical publications are throwing much light on the philology of ancient, mediæval, and modern Greece.

MR. J. A. FROUDE and Mr. E. A. Bond, Keeper of the MSS. in the British Museum, have been elected honorary members of the Royal Society of Literature.

IN Mr. Blanchard Jerrold's *Biography of George Cruikshank*, an original drawing, *The Gin Fiend*, by the author's friend, Gustave Doré, will appear as a frontispiece to the second, or Temperance, epoch of the great caricaturist's life.

MR. ARTHUR ARNOLD's paper on "The Business Aspect of Disestablishment" in the *Nineteenth Century* contains the first tabular estimate of the capital value of, and the claims upon, the property of the Church. Mr. Arnold estimates the surplus at the disposal of Parliament at more than 120,000,000l.

THE Society for Promoting Christian Knowledge has in the press *Sinai*, by Major Palmer, R.E., forming one of the "Ancient History from the Monuments" Series. The Society has also in hand the following volumes of the series:—*The Fathers, for English Readers; The Apostolic Fathers*, by the Rev. H. S. Holland; *St. Augustine*, by the Rev. Prebendary Clark; *St. Jerome*, by the Rev. E. L. Cutts; and *St. Ambrose*, by the Rev. Dr. R. Thornton. Other volumes of the series are in preparation. The Society is likewise preparing for the "Non-Christian Religious Systems" Series a volume on *Confucianism and Taoism*, by Prof. Douglas, and another on *Modern Judaism*, by the Rev. Dr. Edersheim. A volume by Sir William Muir on the *Koran* is in the press.

PROF. TIELE's inaugural address on "The Contributions of Assyrian Research to the Science of Religion," already noticed in the ACADEMY, has just been translated into German by Dr. Friederici, and published at Leipzig. Nowhere can there be found a more impartial and lucid account of the results actually obtained by Assyrian research, more especially as regards the comparative history of religion; Dr. Tiele avoids the Scylla of prejudiced incredulity on the one side, and the Charybdis of rash and premature conclusions on the other, and we could much wish to see his lecture in an English dress.

THE City Library of Bern has just acquired from Grossrath Bürki, partly as a present and partly at a nominal price, a number of valuable MSS. and books. Among the former are eighteen volumes of the correspondence of the Schultheiss Franz Ludwig von Erlach and General Johann Ludwig von Erlach, a true mine of historical documents, which is said to throw quite a new light upon the different parties to the Thirty Years' War.

DR. NEUBAUER, in his forthcoming edition of the Chaldee text of Tobit will, we understand, supply corroborative matter for Dr. Pusey's defence (*Fifty-third Chapter of Isaiah*, Introduction) of the trustworthiness of the quotations from Hebrew sources in Raymond Martini's great work, the *Pugio Fidei*. One important part in his argument will be drawn from Bodleian MSS. A recent work on the Psalms, by Messrs. Jennings and Lowe, accuses Martini of gross imposture and forgery of Hebrew texts. The accusation is based on mistake, and so far fully refuted that Martini stands on as good a footing as ever. Dr. Neubauer's work will be published before Easter for the Delegates of the Clarendon Press.

MESSRS. BEMROSE have in the press *An Elder Sister*: a short sketch of Anne Mackenzie and her brother, the Missionary Bishop, by Frances Awdry; *Anecdotes, Reminiscences, and Conversations of and with the late George Stephenson*, by Thomas Summerside; *A Guide to Ordination in the Church of England*, with full Instructions to Candidates for Holy Orders, by the Rev. T. W. Wood; *Cottages: How to Plan and Build Them*, by William Herbert.

MR. MACLEHOSE will publish, in a few days, *Outlines of Physiology in its Relations to Man*, by Dr. J. G. Mackendrick, and *Creed and Conduct*, a volume of sermons, by the Rev. Dr. R. H. Story, of Rosneath.

A NEW novel, by Mrs. John Kent Spender, will be shortly issued by Messrs. Hurst and Blackett. It bears the title of *Both in the Wrong*.

At the last meeting of the Committee of the Index Society, it was announced that an Amalgamated Index to the series of Household Books and Accounts of Privy Purse Expenses had been put in hand. Those who are acquainted with the mass of interesting matter contained in these valuable works will understand how great a boon such an index will be to historical students. Indexes of the topographical literature of Great

Britain and of books relating to various games of cards are being proceeded with. A letter was read from Mr. Melvil Dewey, the editor of the *Library Journal*, which contained the announcement that a committee of the American Library Association had been engaged for some time in drawing up a code of index rules, and a wish was expressed that some agreement should be come to with the Index Society on the various points.

MISS BETHAM-EDWARDS is engaged upon a popular manual on the *Eucalyptus globulus*, which will summarise her contributions to the *Pall Mall Gazette* and other papers on the subject, and contain much new information and many illustrations.

MESSRS. REEVES AND TURNER are about to publish *The Life and Times of Jemmy Catnach*, edited by Charles Hindley, with numerous woodcuts, forty-two of which are by Bewick.

THOSE who are not members of the Senate of the University of Cambridge, or connected by correspondence, classical intercourse, or otherwise with such, will miss a treat in the apt and terse Latinity of the letter of thanks to his Grace the Chancellor of the University read by the Public Orator at Clare College Lodge on January 22 last, and now published by order of the Vice-Chancellor. Its purpose and burden was acknowledgment of the Chancellor's gift of a "complete apparatus of scientific instruments for the Cavendish Library," and the short extract we cull from the Public Orator's neat and elegant letter will show how readily even such scientific and abstruse matters as the "Cyclops Forge" and "Helmholtz's Double Siren" accommodate themselves to classical description and allusion, in practised hands. "Iuvat speculum illam nitidam contemplari in Arcton positam et Cynosuræ soli observandæ destinatam: lubet ipsas fornaces quæ Cyclopum nominantur invisere, nisi forte quis musicæ magis deditus inter tua subællia malit morari,

ὄφρα κε τερπόμενος ὅπ' ἀκούῃ Σειρήνων."

As we observed some time ago, these Academic compliments deserve collection and commemoration.

THE current number of the *China Review* opens with the first of four lectures on Imperial Confucianism, delivered at Oxford during the Easter and Michaelmas Terms of 1877 by Dr. Legge, the Professor of Chinese at that University. Dr. Legge takes as his text the Sixteen Maxims in which the Emperor Kanghe set forth "the guiding principles by which his subjects should form their characters, order their conduct in the family, among their kindred, and in society at large." These Maxims have been the theme of many treatises, notably one by the son of the Imperial author, and of these Dr. Legge has made use to illustrate his own views on the subject. Mr. Giles follows Dr. Legge with the translation of an amusing satirical chapter from the *Chinghwa yuen*, entitled "A Visit to the Country of Gentlemen." There are several other portions of this work which are well worth translating, and we hope that Mr. Giles will persevere in the path upon which he has thus entered. Mr. Chalmers continues his analysis of the rhymes of the Book of Odes compiled by Confucius, in which he furnishes a valuable contribution to the study of the ancient sounds of the language. "Brief Sketches from the Life of Kung-ming;" the translation of the "Tang kou chi;" the "Geographical Notes on the Province of Kiang-si;" and "Translations of Chinese School Books," are all further continued. The number concludes as usual with literary and scientific notes and queries.

IN the *Revista Contemporanea* for January 30 and February 15, Lopez de la Vega gives an interesting account of the life and writings of the learned Benedictine, Fray Martin Sarmiento. A list is given of his numerous works, most of

which still remain in MS., as the worthy Father had a morbid horror of publication. It is a pity that the present locality of these MSS. is not more clearly indicated. Owing to dispersion by sale and pillage, in no country is such a statement more necessary than in Spain, and by no writers is it more neglected than by Spanish authors. Ticknor highly valued Sarmiento, and in vol. i., p. 201 note (first edition, 1849) of his great work, mentions that he had then in his possession a MS. of Sarmiento on "Amadis de Gaula." One of these hitherto inedited works, "A Study on the Gallician Language, and on Spanish Palæography," is subjoined to the present articles. It is marked by a robust and refreshing common-sense, and may be read with profit notwithstanding the recent advances in philological science. Girding at those who build up linguistic genealogies on insufficient grounds, he says:—"In time there will not be wanting somebody to derive the Spanish language from some lost American tongue because some two dozen words of that language will be found in (American) Spanish." He speaks, too, of the number of the so-called Keltiberian coins, which "andan en manos de todos" and are "tan desconocidas, como comunas." Had the spurious manufacture of these coins begun before Sarmiento's time—1695–1772? He mentions, too, forged documents and MSS. which are still the dread and bugbear of the student of Spanish archaeology. Other articles in these numbers are, "An Exposition of Herbert Spencer's System of Rational Education," by De Asis Pacheco; "An Account of the actor and improvisatore, Mariano Fernandez," by Eusebio Blasco; and "A Scientific Dialogue on Coral," by F. de la Vega.

THOSE who are interested in Catalan literature will find a good account of the present literary movement in Catalonia in *La Academia* of February 15. The number for the 28th contains a notice of the late Amador de los Rios, by Signor F. M. Tubino.

OBITUARY.

LORD RAVENSWORTH, who died on the 19th instant, will be best remembered as the translator of the *Odes of Horace* into English lyric verse (1858), and of the last six books of the *Aeneid* into blank verse (1872). In early life he published a small volume of poetry in honour of the life and works of Sir Walter Scott. His volume of Latin Poems (1865), partly original and partly versions of popular English poems by Scott, Campbell, and Tennyson, was dedicated to Lord Derby, an old friend of kindred tastes, and prompted by the publications of that statesman, Lord Lyttelton, and Mr. Gladstone. Lord Ravensworth printed several of the speeches which he delivered on the hustings and in the House of Lords, and issued in 1868 a pamphlet on the Irish Church question.

MR. HENRY DUNN, for many years the secretary of the British and Foreign School Society, died at Brighton on the 16th instant. *Guatemala, or the United Provinces of Central America* in 1827–28, contained the fruit of his observation during twelve months' residence in that republic. On several occasions Mr. Dunn defended against the attacks of Dean Close and others the system of education patronised by the society with which he was connected. After his retirement from active life he published many eloquent treatises, full of denunciations of the religious beliefs current in England at the present time and of aspirations for the churches of the future. In 1848 he wrote a volume of sketches describing the labours of those devoted Friends, Joseph Lancaster and William Allen. The purport of his *Brief Notes on Matthew Arnold's Literature and Dogma* (1873) is shown in its suggestive half-title of "Facts, not Fairy Tales."

NOTES OF TRAVEL.

THE fourth part of *Petermann's Mittheilungen* has for its leading paper an examination of the "Ethnography of European Turkey during the Fourteenth and Fifteenth Centuries," or during the period of the Turkish Invasion, by Prof. G. Hertzberg. The paper is illustrated by maps from the new edition of Spruner's great Historical Atlas, which is being completed by Dr. Theodor Menke. Herr Knipping communicates the results of his survey of the district which lies between Ozaka, Kioto, and Omimesanjo, in Japan; and Prof. Nordenskiöld completes his account of the progress of maritime discovery along the Siberian coasts, in relation to his expedition which is to leave Sweden for these seas in July. Dr. Emin Effendi, chief surgeon of the Egyptian staff in the Equatorial provinces, has sent Dr. Petermann a route map of his second journey from Magungo, on the Mwutan (Albert Nyanza) by Kirota and Masindi, to Mrooli (July to August, 1877). After Sir Samuel Baker's expedition to Masindi it was generally believed that Kabrega, the ruler of Unyoro, was unapproachable. Dr. Emin Effendi, however, remained with him alone for a month. In November the traveller intended to leave Mruli for Uganda and Karague, thence, if possible, to reach Lake Akenyara, the Mfumbiro Mountains, and Ruanda.

FROM No. 450 of *Les Missions Catholiques* (Lyon) we learn that the Society of Missionaries of Algeria has just been charged by the Holy See with the task of founding two large mission stations in Equatorial Africa; the one to have its centre on Lake Tanganyika, the other on the Victoria or Albert Lake. Twelve missionaries are about to set out for this purpose, and have received the powers of *préfets apostoliques*. One party, which is to be under the charge of the P. R. Livinhac, of the diocese of Rodez, will found the mission on the Victoria; the other, under P. R. Pascal, of the diocese of Viviers, that on the Tanganyika. A similar mission is to be sent to the country of the Muata Yanvo, further in the interior.

THE latest Bulletin of the American Geographical Society (No. 5) brings an important paper by Dr. S. Merrill, on "Modern Researches in Palestine." Dr. Merrill has been connected with the American Palestine Exploration Society as its archaeologist for three years past, two years of which he has spent in the field. He treats here chiefly of the Jordan Valley, the possibility of its being irrigated, its hot sulphur springs, its remarkable *tels* or mounds, the question of the site of the "Cities of the Plain;" and summarises the facts illustrating the fertility and populousness of the country east of the Jordan in ancient times.

We have just received the fifty-fourth *Ergänzungsheft* of *Petermann's Mittheilungen*, which is devoted to an essay on the Ethnography of European Russia, by the editor, based on the work of A. F. Rittich, and illustrated by two splendid large-scale ethnographic maps of Russia, incomparably the finest that have ever been prepared in elucidation of this subject.

MR. ANDREW GOLDIE, who has been for some time engaged in making botanical and other collections in New Guinea, has explored in the course of his investigations some parts of the island hitherto unvisited by Europeans. He started from Port Moresby, and in the course of his journey he made the discovery of the presence of gold in a river which eventually runs into Redscar Bay. Mr. Goldie travelled along the bank of the upper part of this river, to which he has given his own name, for about forty miles, and the distance from its mouth to the point which he reached he estimates at over 100 miles. On November 20 he found it very hard work to make any progress owing to the dense bush, and he reluctantly abandoned the attempt.

He succeeded, however, in getting a view of the country in front of him, and he thinks that, if he could have gone a day's journey further, he would have come upon a flat, open country. Mr. Goldie passed through four tribes of natives in the course of his journey inland, and he describes them as being all in terror of one another. He has collected 1,000 skins of birds, among which there are 124 distinct species, some being quite new; he has also been fortunate enough to obtain twenty-three birds of Paradise, *Paradisæa Ragiana* species. Mr. Goldie considers that in his recent explorations he has travelled fully 400 miles, though the furthest point reached was about fifty miles distant in a straight line from the coast. He was to start on a cruise down the south-east coast at the end of December, and expected to return to Port Moresby in May.

LIEUT. WAUTIER, who took part in the Mexican Expedition, has been appointed by the Belgian Committee of the International African Association to succeed Captain Crespel, whose death at Zanzibar we recently recorded. Preparatory to starting for the East Coast of Africa, Lieut. Wautier has paid a visit to Berlin to consult Dr. Nachtigal.

CAPTAIN T. O. S. SPEEDY, who is now at Suez, intends to start shortly on a journey along the borders of Western Abyssinia and Egypt, in the region to the south of the Blue Nile. He proposes after that to visit the Kaffa and Enarea districts, and also the Galla tribes in the neighbourhood of the River Gojâb.

DR. GERHARD ROHLFS is said to be contemplating a journey of exploration in Eastern Africa, chiefly in the region of the Soudan.

LIEUT. W. J. GILL, R.E., who has recently returned to England, has consented to give an account of his adventurous journey through south-western China into Burmah at an early meeting of the Royal Geographical Society.

Stanford's Stereographical Map of the British Isles. Scale: $\frac{1}{730,431}$. (London: Edward Stanford.)

This map, as its name implies, represents the physical features in relief, the map having the advantages without the disadvantages of a model; the name is perhaps a little unfortunate, as by common consent the word "Stereographic" has been appropriated to a particular projection on which maps are frequently drawn, and the publisher might have adopted the new word "Physiographical," which would have suited the map almost equally well. In another edition the shading on the group of hills at the head of the Dee Valley might be a little reduced with advantage, as they appear to us to be somewhat too dark. But having said this, we can only add words of praise for the care and taste bestowed on this production. The great advantage of this map over others is the way in which the plains, as well as the rolling country and hills, are presented to the eye. The lowlands and river valleys can be traced with great ease, and the relative height of the hills, as well as the continuity of such peculiar but not very pronounced features as the Chilterns and Cotswolds, is readily appreciated. To the student of British history this map is invaluable; for instance, in the period of the successive settlements and extensions of our Teutonic forefathers, this map enables us to understand how the Jutes, landing at the Isle of Thanet, moved naturally up the valley of the Thames along the northern side of the Weald; how the Saxons, who landed at or near Southampton, would spread out over the Winchester plain; how the Angles, who landed on the east coast, finding themselves confined by the marshes and the fen country on the one hand, and the forests of Epping and Hainault on the other, should remain an isolated people; how the Angles, who entered the Humber, should make themselves two bands, the one ascending the plain of York, the other

the valley of the Trent; this latter finally making its way into the Severn valley, and completing the Anglo-Saxon settlement of England. It is certainly the best physical map of the British Isles that we have seen, and may fairly rank as a work of art.

AN UNKNOWN POEM BY MANZONI.

THE publishing firm of P. Carrara, of Milan, have just issued a poem of Alessandro Manzoni's that has been unknown up to the present time. The poem is printed from the original MS. of the author, which is in the possession of the Brera Library. It deals with the triumph of freedom over tyranny and religion. The last number of the *Rivista Europea* treats of this interesting treasure-trove. It says that the poem is a juvenile work in the strictest sense of the word, for it was written in Manzoni's fifteenth year, as attested by a note made by himself, later on, upon the MS. Manzoni presented the poem to his youthful friend Pagani, and it is his nephew, Signor Francesco Rovetta, of Brescia, who has presented it to the Brera. Manzoni's note runs thus:—

"These verses, I, Alessandro Manzoni, wrote in the fifteenth year of my life, not without self-satisfaction and poetical assumptions which I now abnegate on reading them again with riper experience and a more practised eye; but as I find in them no untruth, no vain praise, and nothing unworthy of me, I acknowledge the general tendency of the work as mine. I see in it partly the folly of a youthful mind, but partly the individual stamp of a sincere and manly character."

Now this work is in some respects directly contrary to Manzoni's later enunciations, and it is this that gives his own express acknowledgment of the verses their especial value as an insight into the mental development of the author of *I Promessi Sposi*. The *Trionfo della Libertà* borrows its form from the *Divina Commedia*; it is written in *terza-rima*, and treats of its subject as an allegorised vision in which Peace, Justice, Patriotism, Tyranny and Religion are personified. The phrases and the spirit of the French Revolution pervade the work. It is fierce in its denunciation of priests and Pope. The shade of Brutus is evoked to apostrophise Rome in burning phrase:—

"Ah! della libertà l'ampia ruina
Tutto si trasse nella notte eterna,
Ed or serva sei fatta di reina;
Che il celibe Levita ti governa
Con le venali chiavi ond' ei si vanta
Chiuder la porta e disserrar superna.
E i Druidi porporati, o casta, o santa
Turba di lupi mansueti in mostra
Che della spoglia dell'agnel s'ammanta!
E il popol reverente a lor si prostra
In vile atto sommessso, e quasi Dii
Gli adora e cole: oh sua vergogna e nostra!"

It is interesting to contrast this utterance with Manzoni's first printed work, the *Inni Sacri*, in which breathes the sincere religious spirit that afterwards distinguished his famous romance.

THE HEEL OF ITALY.

Napoli: March 12, 1878.

Having during a recent journey through the Heel of Italy visited Otranto, a few notes on that ancient city may be acceptable to readers of the ACADEMY, as the place is very rarely seen by English travellers. Otranto, the Hydruntum of the Romans, although still holding rank as an archiepiscopal city, is at the present time little more than a fishing village. The Aragonese "Castle of Otranto" is a picturesque building with the almost omnipresent arms of Charles V. over the principal entrance. The view from the ramparts across the blue strait to the snow-capped mountains of Albania is exquisite in the extreme. Some slight traffic is occasionally

carried on by small craft between Otranto and Valona on the opposite coast. Very small remains of the ancient Greek or Roman city are still in existence, but I noticed a few ancient columns lying about in corners, and two Roman inscriptions to the Emperors Marcus Aurelius and Verus are built into the walls of a house in the principal street. The city in fact has never recovered the capture of the place by the Turks in A.D. 1480, when the greater part of the inhabitants were massacred and the rest carried off into slavery. The cathedral which crowns the highest part of the city was much injured during the siege and after it, and besides some ancient pillars and a handsome rose window in the western front, it contains little of architectural interest. The pavement, however, which suffered much damage from the hoofs of the Turkish horses which were stabled in the church, is, perhaps, the most extraordinary and curious in the world. The design is that of a vast tree, whose trunk issues from a point close to the west door, and thence extends its branches over the nave, aisles, choir, and side choir chapels. Among the branches various subjects are represented, with occasional inscriptions to explain their meaning. In front of the west door an inscription in two lines commemorates the donor and the artist, who was probably a Greek.

EX IONATH DONIS PER DEXTERAM PANTALEONIS
HOC OPVS INSIGNE EST SVPERANS IMPENDIA DIGNA.

A second inscription half way up the nave repeats the information that the work was done by Pantaleon at the command of Jonathan, Archbishop of Hydruntum, and a third still higher up states the date: ANNO AB INCARNATIONE DNI NRI IHV XPI MCLXV. The mosaic is, therefore, more than seven hundred years old. At the foot of the tree are several figures, some naked and some clothed, blowing trumpets; with them are two elephants. Higher up among the branches are REX ALEXANDER seated; the erection of the Tower of Babel, with the people on ladders; various monsters, one human with two heads, and another, a beast with four; fish bestridden by boys; and groups of artificers engaged in different kinds of handiwork, such as sawing wood. In the choir are the symbols of the months, with characteristic groups within circles; Adam; Eve with the serpent; and a two-horned beast. Glass is introduced in the mosaics of the choir, and around some of the circles are apparently in some instances inscriptions in imitative Arabic, as well as others in Latin. In the choir aisles are represented the Patriarchs. The high altar is of white marble with interlacing patterns sculptured upon it. Many of the pillars are evidently torn from ancient Greek and Roman temples, and they are surmounted by antique and early Gothic capitals. The roof of the nave, although late, is fine and curious. In the chapel at the end of the south choir-aisle the bones of eight hundred persons martyred by the Turks are preserved in presses, and under the altar the stone is kept upon which they were beheaded. It is interesting to observe how in all ages of their history the Turks have kept up their character as shedders of blood. The cathedral tower is detached from the church, and its lower story is of bevelled masonry.

The whole of the interesting but seldom-visited tract of country lying between the Gulf of Taranto and the Adriatic consists of a slightly-elevated tableland of limestone, which often crops up to the surface. Olives and carobs are the characteristic trees, and many of them are of great age. Much wine is produced. In order to get rid of the surface stones conical buildings of Cyclopean appearance are constructed in the fields. Many of these contain a chamber to protect the husbandmen from the heat. Water is very scarce, so much so that the water in which vegetables have been boiled is often passed round from house to house until the whole has been evaporated. The stone, in its texture and pale yellow colour, resembles that of Malta, and

the architecture of the two places is singularly alike. Oria, the Greek Oria, which lies in this district, has a singularly grand appearance from a distance, its castle, churches, and convents crowning a hill which overlooks a vast expanse of cultivated but arid rocky plain. Near it I observed and ascended, what is rarely seen in Italy, a large tumulus. It occupies a position to the right of the road leading from Manduria. I saw in Oria a beautiful leaf formed of gold plate, one of forty found in a Greek tomb. Lecce, the capital of the district, is a large and fine city, abounding in excellent architecture of the later Renaissance period. It well deserves a visit.

CORRESPONDENCE.

GREEK MS. AT OXFORD.

London: March 24, 1878.

The first item mentioned by Mr. Warren as occurring in the MS. now in his hands appears to be simply a treatise on the monastic life. I should translate thus:—"A second set of twelve rules, or Handbook [*al. progress*] of a cloistered monk, wherein is the canon of forty years' and of fifty years' profession, and also of . . . ?" I suspect an error of the copyist in *φυσολογίας*, which is a non-existent word, so far as I know, in Middle and Lower Greek, as well as in the classical language. The reference to the terms of forty and fifty years, as I apprehend, points to some such usage of Eastern monachism as that which gave the *sempecta*, or monk of fifty years' profession, special privileges in the Benedictine abbeys of the West. But I have not the Basilian Rule at hand for verification, and Helyot does not touch the point.

R. F. LITTLEDALE.

THE DISCOVERIES AT MYKENAE.

Queen's College, Oxford: March 26, 1878.

Dr. Schliemann has pointed out to me that my reference to the gold objects discovered in Ithaka by Mr. Lee (ACADEMY, March 2) is likely to be misunderstood. I ought to have explained that they belong to the Roman period, and in spite of the admiration Mr. Hughes lavishes upon them, were, of course, not comparable with the prodigious number of gold ornaments already excavated at Mykenae. My object in mentioning them was to illustrate the fact that gold objects "found in Greek graves of all ages" fully justify the name of "Treasury" given to tombs whether at Mykenae or elsewhere.

A. H. SAYCE.

PRONOMINAL IDEOGRAPHS.

London: March 26, 1878.

Those who have devoted themselves to the study of the growth of language, and especially of the written expression of it, know that in the early stages one of the most difficult problems was the expression of pronominal relationships.

The majority of the systems of early writing known all bear every indication of having originated in pictorial writing. The hieroglyphic writing of Egypt bears the most marked traces of such an origin; and this stage must have been at a very remote period in the history of Egypt, for in the inscriptions of the earliest dynasties we find not only a phonetic syllabary in use, but even a fully developed alphabetic system, showing centuries of philological growth in Egyptian.

The cumbrous system of the Celestial Empire had its origin in pure pictography, and this at a very remote period. Mexico and Peru had pictographic writing, and a system of apparently the same class, but in what stage of development we do not as yet know, was in vogue in the Hittite kingdom in Western Asia, as shown by the so-called Hamathite inscriptions.

With picture-writing the limit of grammatical expression is soon reached; the sentences can be only of the most brief nature, and the growth of a language is much hampered by the employment of such a poor machinery of expression.

In so primitive a nursery of the human race as Babylonia, it is very natural that we should expect to find some traces of the pictography which gave rise to the cuneiform writing; and in this we are not disappointed. In a paper which I read recently before the Anthropological Institute, I pointed out how large an insight we gained into the social life of prehistoric Babylonia by the study of what may well be called palaeographical photographs. But the system in vogue in Babylonia affords some very interesting facts with regard to the growth and expression of pronominal relationships. The most natural mode of expressing the first personal pronoun would be by the pictorial representation of the human figure. If we take such a pictorial sentence as "man + hand," the later being used in the metaphorical sense of "to give," we find at once a difficulty arising in our minds as to whether it reads "I give," or "man gives," that is "he gives." And when we come to examine the form of the first personal pronoun in Babylonian writing we find that a similar confusion arose. The sign used for the first personal pronoun in Babylonian (Akkadian) is , of which the phonetic value is MU; but with phonetics we do not deal now; why should this particular group be used? If we trace the form back to the hieratic or middle writing we find it is , which does not afford much clue, but the pictorial form is much more marked, namely , which is evidently a rude representation of the human form.

It may be here noticed that the character is placed horizontally; and from the early forms of this and other characters, I am nearly certain that there was a period when the picture-writing of Babylonia was written either horizontally or vertically, as is the Egyptian.

We now pass to the pronoun of the third person singular. Here we find in phonetic stage three forms IN, AN, or UN, this latter one being evidently the earliest, and the one to which the picture-form was applied. The court script form of this character is , which has the ideographic value of "man" in Assyrian; but if we trace the character back we find the hieratic form is , which contains the most marked traces of its pictorial origin in , where again we have the human form. Thus we see that the same pictorial sign gave rise to the pronoun-ideographs of the first and second per-

sons, showing very clearly the confusion of ideas which would arise in the simple sentence quoted above.

We find associated round the character Δ such ideas as "name," "record," "to give," as well as "I," all well suited to its pictographic origin.

The plurals of these two persons, first and third, were naturally expressed by collective ideographs, and need not be referred to.

The expression of the second personal pronoun was one which would not come into use until the language had made some considerable literary progress, but still, the sign selected for the expression of this person gives us some insight into the mental workings which prompted the idea of the pronominal relationship of the second person.

We find the sign Δ used for the second person; but this ideograph, of which the phonetic value is ZU, has also the ideas of "to teach," "to inform," "to know," and "knowledge" attached to it; so we can see that in employing this sign as the expression of the second person singular "thou," the primitive grammarians recognised the relationship of "speaker, and spoken to," and expressed it well by the idea of "informer and informed one."

The plural second person was expressed by the combination of the singular form and the collective third person plural—that is thou + they = ye. The relative "who" or "which" was expressed by "man." So we have *man temple man built*, really "who the temple he built."

No other known system of writing is in any way so full of material by which the student can study the early workings of the human mind in the work of grammatical composition, and it is curious to notice to what an extent the early Babylonians seem to have been able to carry the use of ideographs. W. ST. C. BOSCAWEN.

P.S.—It must be borne in mind that I am dealing simply with the ideographic and pictorial expressions, not with the philology of the words signifying the pronoun.

DUNCKER'S "HISTORY OF ANTIQUITY."

Ball. Coll., March 17, 1878.

In the spelling of Assyrian names, I am, of course, entirely at Prof. Sayce's mercy, and I can only say that I shall take careful note of his corrections. But,

1. If Prof. Sayce did not intend to make me the author of the mistake about *Kaldai*, why did he mention it in that part of the review which is concerned with the translation and the faulty representation of *German* letters?

2. I protest very strongly against the assertion that "it is of little consequence whether the author and translator are conjointly responsible for such mistakes, or the translator only." Such a canon will not bear examination.

3. I have not said that *Chufu* was a Greek word. I said that the *kh* of Egyptian words is represented in Greek by *chi*, and that, for this reason, it was permissible to keep the letter *ch* in Egyptian words, as well as Greek, to avoid using *kh* and *ch* side by side. This may be a bad argument, but it does not involve the absurdity which Prof. Sayce finds there. I may further say that Prof. Duncker, while using *kh* for Assyrian names, uses *ch* for Egyptian, and no German pronounces *ich* as *ikh*.

4. As to consistency in Greek names, where will you find it? Grote, who took some pains in the matter, writes *Thaas* and *Cyprus*, *Corinthians* and *Korkyraeans*, *Kimón* and *Thucydides*, *Kyréné* and *Cyrrus*, *Kyréné* and *Krété*. I also find that Prof. Sayce writes *Akhilles* and *Colchis*. And suppose that I write *Kelaenae*, what is gained?

5. Professor Sayce says: "To make the confusion worse, Mr. Abbott sometimes writes a single *h* instead of *ch*." I have not done so. Where Duncker has *h* I write *h*; where he has *ch* I write

ch; and where he has *kh* I write *kh*, as I might be expected to do. In spelling *Edorankhus* with *kh* I followed Duncker (in ed. 4). E. ABBOTT.

Queen's College, Oxford:
March 20, 1877.

I am sure the readers of the ACADEMY must have had enough of what will seem to them a somewhat pedantic discussion on spelling reform; though the correct spelling of Oriental names is not so indifferent a matter as it may appear, since two or more personages have before now been made out of one in consequence of the name being differently spelt by English and continental scholars. (1) If Mr. Abbott will read over the passage to which he refers, he will see that I ascribe the mis-spelling *Kaldai*, not to a "faulty representation of *German* letters," but to the fact that an Orientalist was not consulted. I conceive that it is the duty of a translator to verify his author's references, and to see that he does not reproduce a mere misprint. I also conceive that when a translation is revised by the author, the responsibility for avoidable errors is shared between him and the translator. But so far as the public is concerned "it is of little consequence whether" they are both "conjointly responsible for such mistakes, or the translator only." So much for No. 2. As for (3) Prof. Duncker was quite right in using *ch* in German in the cases in dispute, since the German *ch* is pronounced in the way required; but I contend that the German *ch* does not represent the English *ch*, and that a translator, therefore, was bound to look out for some combination of letters which by common consent does so. *Kh* is frequently so used in English, and, though a mere make-shift, might have been employed, especially since English students of Egyptian have been in the habit of writing *Khufu*, *Khafra*. (4) Grote's rule was to keep *c* in familiar names whenever the substitution of *k* would cause a change of pronunciation. But I purposely selected words from Mr. Abbott's translation which were not familiar. The answer to (5) must be the same as the answer to (2).

A. H. SAYCE.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, April 1.—2 P.M. Royal Institution: General Monthly Meeting.

5 P.M. London Institution: "The Seed and Germination," by Prof. R. Bentley.

5 P.M. Musical Association: "On the Motion of Air in Organ Pipes," by Dr. W. H. Stone; "On a Suggested Improvement in Staff Notation for Vocal Music," by A. Hill.

5 P.M. British Architects.

8 P.M. Victoria Institute: "Modern Geologies exemplified in their Bearings on the Antiquity of Man," by Prof. Birks.

8 P.M. British Architects.

TUESDAY, April 2.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.

8 P.M. Civil Engineers: "The Huéla Pier of the Rio Tinto Railway," by T. Gibson.

8.30 P.M. Zoological: "Contribution to the Ornithology of the Philippines," VII., by the Marquis of Tweeddale; "New Lepidoptera of the group *Bombycites* in the British Museum," by A. G. Butler; "Description de la nouvelle espèce de Casoar (Casuarus Edwardsi)," by E. Oustalet.

8 P.M. Photographic: "Dry-plate Photography," by Mr. England.

8.30 P.M. Biblical Archaeology: "Memoir of the late H. Fox Talbot," by R. Cull; "Assyrian and Babylonian Names for Copper and Brass," by Prof. F. Lenormant; "Translation of an Egyptian Contract of Marriage," by E. Revillout; "On an Inscription of Psametik II. in the Museum of Palermo," by Gertrude Austin.

WEDNESDAY, April 3.—8 P.M. Microscopical: "On a New Form of Object-glass," by J. W. Stephenson.

8 P.M. Society of Arts: "Our Wealth in Relation to Imports and Exports," by Ernest Seyd.

8 P.M. British Archaeological: "Through Spain to Italica," by T. Morgan; "Reservations in old Leases granted by the Bishops of Hereford," by C. H. Compton.

8 P.M. Geological. Graphic.

THURSDAY, April 4.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.

7 P.M. London Institution: "History of some of our Domesticated Animals," by Prof. Rolleston.

8 P.M. Linnean: "On some minute hymenopterous Insects," by Prof. J. O. Westwood; "The Fungi of Texas," by M. C. Cooke; "Remarks on the peculiar Properties ascribed to a Fungus by the Samoans," by the Rev. T. Powell.

8 P.M. Chemical: "Application of the Microscope to some Special Branches of Chemistry," by H. C. Sorby.

8.30 P.M. Royal. Antiquaries.

FRIDAY, April 5.—4 P.M. Archaeological Institute.

8 P.M. Geologists' Association.

8 P.M. Philological: "On the Spoken Swedish Language," by H. Sweet.

9 P.M. Royal Institution: "Philosophy of the Beautiful," by G. J. Romanes.

SATURDAY, April 6.—3 P.M. Royal Institution: "On the Clavichord of England, Italy, France, and Germany," by Prof. E. Pauer.

SCIENCE.

Anthropology. By Dr. Paul Topinard. With Preface by Prof. Paul Broca. Translated by Robert T. H. Bartley, M.D. (London: Chapman & Hall, 1878.)

It can hardly be matter of surprise that the founders of the "Bibliothèque des Sciences Contemporaines"—the series to which the original of this work belongs—should have thought fit to start their Library with several volumes devoted to the Science of Man. The avowed object of the publishers is, in fact, to offer to the public a series of popular treatises on the leading sciences of the age; and assuredly no science deserves to be more popular at the present day than anthropology. Dealing with man in his entirety, it presents so many sides that he must indeed be hard to please who fails to find in it something suited to his special tastes. So long as the Science of Man was confined to pure ethnology it naturally appealed to a comparatively small circle. But about twenty years ago the science took a new departure: ethnology expanded into anthropology, and its attractions multiplied in proportion as its sphere enlarged. Two events occurring about this time contributed in no small measure to promote this development: the one was the discussion on the antiquity of man excited by M. Boncher de Perthes' discoveries in the valley of the Somme; the other was the appearance of Mr. Darwin's *Origin of Species*.

The development of anthropology as a consolidated science is of so recent a date that such a volume as Dr. Topinard's was much needed to guide the student. It was fit, too, that a work on this subject should come to us from Paris. Paris is, in fact, the seat of a brilliant little school of anthropologists, in which Dr. Broca has, from its very foundation, shone out as the leading light. When, therefore, the French publishers, Messrs. Reinwald and Co., sought an author, they naturally turned to Dr. Broca; and, although the work before us is not written by that distinguished anthropologist, he has, by the contribution of a Preface, sent it forth with the stamp of his authority.

Few scientific workers are more enthusiastic than Dr. Paul Topinard, the author of this volume. He always has some original investigation on hand. Besides contributing largely to the anthropological journals of Paris, he holds the curatorship of the Museum of the Société Anthropologique; and at present he is giving, at the Ecole d'Anthropologie, a course of Monday lectures on the history of the science, on the physical and physiological characters of man, and on anthropometry. Yet, with his hands thus filled, he has found time to write a manual for the "Library of Contemporary Science."

Anthropology is so complex a subject that hardly any writer would be competent

to deal equally well with all its branches. Dr. Topinard has, therefore, acted judiciously in confining himself in the present work to those departments of which he is a master, and has contented himself with the barest references to other branches of the science. Hence the anatomical and physiological parts of anthropology form the staple of this work; while ethnology, prehistoric archaeology, philology, and sociology—though including subjects of surpassing interest—are left to be treated by other writers in companion-volumes. As a consequence of this limitation it is not surprising that in a volume of about 550 pages the author should occasionally drift into technical details, which the student will certainly estimate at their value, but which the general reader is likely to feel oppressive. The work is divided into three parts—the first treating of man considered in his *ensemble*, and in relation to the lower animals; the second describing anatomically the chief modifications of mankind; and the third, which is the briefest, though perhaps the most interesting to the unscientific reader, discussing the origin of man.

Dr. Topinard's volume forms a welcome addition to the anthropologist's library, and will be specially valuable to those who desire to make anthropological measurements. It will be evident, however, from what has been said that it makes no pretence to be a general manual of anthropology. Such a work still remains to be written, though it is pleasing to hear rumours that an elementary text-book is in preparation by a distinguished anthropologist in this country. If a stranger desire to take up the study it is really difficult, in the present state of our literature, to refer him to any single comprehensive work; though we could hardly hesitate to lay our finger on the article "Anthropology" in the current edition of the *Encyclopædia Britannica*, from the accomplished pen of Dr. E. B. Tylor, as the neatest outline of the science which has yet appeared.

With respect to the translation of Dr. Topinard's work, we may remark, without, however, having yet had the advantage of seeing the original, that it appears to have been executed with considerable care and ability. Still, it is evident that here and there the French text has been rather too closely followed; and we would suggest that in another edition, wherever English authors are cited, the references should certainly be made to the original works rather than to French translations. Mr. Darwin's writings, for example, are frequently referred to; but the English reader is hardly prepared to meet them in the unfamiliar shape of *L'Origine des Espèces*, or *La Descendance de l'Homme*, or *Voyage d'un Naturaliste autour du Monde*. To a Frenchman this is convenient: to an Englishman absurd.

F. W. RUDLER.

OBITUARY.

On the 20th inst. died Robert Julius Mayer, of Heilbronn, in Würtemberg, at the age of 63. Although it is now many years since the latest of Mayer's papers was published, his name is not likely to be soon forgotten. "The mechanical equivalent of heat" is an expression which was in-

roduced into science by Mayer, who must always be regarded as standing in the front rank of the founders of the dynamical theory of heat. In 1842, while practising as a physician in the town of Heilbronn, he published a paper in which the relations which subsist between heat and work were defined, and a computation of the mechanical equivalent of heat was given. Mayer's work was not of an experimental nature. He had not the means to make experiments, but he calculated the value of the mechanical equivalent by the help of the best data procurable at the time, on the assumption that when a body is heated by compression, the heat developed is the equivalent of the work expended in compressing the body. Subsequent researches have shown that this assumption is justifiable in the case of air, the substance from the properties of which Mayer's conclusions were drawn. In 1842 the specific heat of air at constant volume, and the ratio of the specific heats at constant volume and constant pressure, were very imperfectly known, and hence it is not surprising that the value Mayer obtained for the mechanical equivalent was very far from the true value. When corrected, however, in accordance with the results of more recent experiments, his calculation does not differ much from the value of the mechanical equivalent obtained by Joule and others by totally different processes. In 1845 appeared Mayer's paper on "Organic Motion and Nutrition," in which he speculates fearlessly and acutely on the agency of the so-called vital force. One of his most noteworthy papers is that which was published in 1848 on "Celestial Dynamics." In this paper he calculated the heat that would be developed by the collision of the earth with a target strong enough to stop its motion, and propounded the hypothesis that the sun's power is maintained by the showering of meteoric matter upon its surface, a view which was afterwards developed by Sir Wm. Thomson. One noticeable point to which attention is called in this paper is the effect of tidal friction in dissipating the energy of a planet's aerial rotation, an effect which was proved by Adams and Delaunay to exist in the case of the earth. Mayer's last paper, "On the Mechanical Equivalent of Heat," was published in 1851. Soon after this time, in consequence of the severe labours and bitter disappointments he had gone through, and the rebuffs he had met with at the hands of his scientific contemporaries, his mind became affected, and though at a later period he partially recovered, he was unable to resume his scientific investigations. It is possible that by some writers undue credit has been assigned to Mayer in connexion with the development of the dynamical theory of heat. If this be so, it is equally indubitable that by others his merits have been unduly depreciated. His labours cannot be gauged by the standard that would be applied to Joule's; for they are of a totally different character. Nevertheless, it must be claimed for Mayer, that in an obscure German town, without the means of making experiments, without the co-operation or even the sympathy of his scientific friends, he independently, and for himself, discovered the important relation which has produced the grandest recent advance of natural science.

We have to record the death of the distinguished chemist, M. A. Lamy, whose researches in organic, but more especially in inorganic, chemistry have contributed not a little to advance science. His earliest investigations have reference to the composition of phycite, the sugar-like ingredient of *Protococcus vulgaris*, which he found to be identical with the erythroglucose of Stenhouse. He will be remembered for his isolation and examination of the properties of thallium; his results were published about the same time that Mr. Crookes announced the discovery of that metal. M. Le Verrier and M. Dumas endeavoured at the time to claim for M. Lamy the discovery of thallium, and the claim was founded on a com-

munication made by M. Lamy to the Société Impériale des Sciences, de l'Agriculture, et des Arts, of Lille, on May 16, 1862. On May 1, 1862, the International Exhibition was opened; and there, in a case arranged some days before, and open to the inspection of scientific men, Mr. Crookes displayed several grains of the new metal and some of its compounds. Moreover, Mr. Crookes announced the discovery of the new element, which at first he thought to be a member of the sulphur group, on March 30, 1861. Mr. Crookes' specimen exhibited at the International Exhibition was a black powder; M. Lamy appears to have hit upon a more abundant source of the newly-discovered element, and on June 18, 1862, exhibited to a jury of chemists in London a beautiful ingot of the new metal. Mr. Crookes' name for the new metal was adopted, and he, it should be stated, was the first to congratulate M. Lamy on his success, and to envy him nothing but his opportunities. In 1864 M. Lamy described thallic alcohol, and in the following year published the results of his investigation of the phosphates of thallium.

SCIENCE NOTES.

PHYSICS.

Thermal Conductivity of Gases.—The differences presented by gases in respect of the conduction of heat through them is usually exhibited to an audience by raising to incandescence a number of exactly similar and equal platinum spirals by means of one and the same electrical current, each spiral being supported in a glass vessel containing one of the gases in question. Prof. Kundt (*Annalen der Physik, neue Folge*, ii., p. 384) has arranged another means of exhibiting the experiment which is in some respects more simple. A glass tube, about eight inches long and half an inch in diameter, is closed at one end and fused into another tube in such a way that half the smaller tube is enveloped by the larger one, the distance between the two being about an eighth of an inch. By means of an aperture which can be afterwards closed, the space between the two tubes can be filled with any gas, at any desired pressure, by means of a mercury pump. A series of exactly equal vessels of the kind described is prepared, each containing a different gas, and a little ether is poured into the inner tube of each. If now all the vessels be plunged simultaneously into hot water, heat will pass from the outer to the inner tube by conduction, as well as by convection and radiation. The ether rises to its boiling-point, and its vapour can be ignited at the top of the inner tube. If the experiment be made in this way with hydrogen, air, and carbonic acid, the flame appears first at the mouth of the hydrogen tube, and last of all at the carbonic acid tube. Similarly it may be shown that the conductivity is independent of the pressure.

Influence of Light on the Electrical Conductivity of Metals.—In the *Annalen der Physik*, vol. ii. (part 12), are several papers on this subject. Dr. L. A. Forssmann, of Stockholm (p. 513), has repeated many of the experiments of Sale, Siemens, and Adams with selenium, and obtained similar results. The paper contains speculations as to the cause of the influence of light on the electrical conductivity of selenium. Dr. Werner Siemens (p. 521) gives reasons for doubting the conclusions of Dr. Börnstein on the variation of conductivity of gold, platinum, &c., due to the action of light. G. Hansemann's paper (p. 550) is on the same subject, and his results agree with those of Dr. Siemens. Dr. Börnstein showed that not selenium only, but other metals—gold, silver, platinum, &c.—also undergo an increase of electrical conductivity when exposed to any illuminating source. He employed two methods—(1) that of Wheatstone's Bridge, (2) the method of damped oscillations—for measuring the resistance. By the first of these the increase of conductivity of metals was found to be only .0125 per cent. The electro-

motive force employed was that of a Leclanché cell. In the second method the currents were the feeble induction currents due to the oscillations of a magnet in a coil of wire, and the increase of conductivity was from 3 to 5 percent. Dr. Börnstein explained this difference by the assumption that the electric current weakens the sensitiveness of the metals to light. Hansemann has investigated the matter afresh, employing both the methods used by Börnstein, but he is unable to confirm the results of the latter. He does not find that the conductivity of gold, silver, platinum or aluminium changes in the smallest degree when exposed to the action of light. Dr. Börnstein has recently announced (*Beiblätter*, i., 577) that the illumination of the junction of two metals in a circuit gives rise to a photo-electric current, similar in character to a thermo-electric current, but in the opposite direction. Here, again, Hansemann has repeated Börnstein's experiments with more sensitive apparatus than was used by the latter, and is unable to detect the smallest trace of the photo-electric force in question.

Reflection of Polarised Light from the Equatorial Surface of a Magnet.—In the *Philosophical Magazine* for May, 1877, Dr. J. Kerr published an account of his experiments on the change in the plane of polarisation when a beam of polarised light is reflected from the polished polar surface of an electro-magnet. Dr. Kerr in continuing his magneto-optic researches has examined the influence on a polarised beam of reflection from the equatorial surface of a magnet. A rectangular bar of iron, seven inches long, forms the armature of an electro-magnet placed upright. One of its vertical faces is highly polished, and forms the reflecting surface in question, the plane of incidence of the light being horizontal. By means of a commutator the polarity of the bar could be reversed at pleasure. The results obtained by Dr. Kerr, whose experimental skill in enquiries of this kind is very considerable, are of a decided though faint character, and are not inconsistent with those obtained by him when examining the polar surface of a magnet by the same process. The experiments were made at incidences varying from 85° to 30° . At angles greater than 85° or less than 30° no positive results were obtained. The law of the optical action of magnetism when the incidences are great may be stated as follows:—Whatever be the angle of incidence, between grazing and principal, the effect of magnetisation of the mirror is to turn the plane of polarisation of the reflected light through a very small angle, in a direction always contrary to that of the hypothetical Ampèrian currents in the magnetised bar. Dr. Kerr made further experiments with the plane of incidence of the polarised light perpendicular instead of parallel to the lines of magnetic force. The incidence varied from near normal to grazing, but in no case was any optical effect of magnetisation observed.

Engraving on Glass by Electricity.—A method of engraving on glass, which appears to be simple of application, is described by M. Planté in the January number of the *Annales de Chimie* (t. xiii., p. 143). A plate of glass is placed horizontally on a table, and a concentrated solution of potassium nitrate poured over its surface so as to form a thin layer. Of the two platinum terminals of a Planté secondary battery of 50 or 60 cells, one is immersed in the layer of liquid which covers the plate, along the edge of the plate; the other terminal is enclosed, except at its extremity, in an insulating sheath. The operator, holding the latter in his hand, touches the glass covered with the saline solution at the points where he wishes to engrave characters or a design. A luminous trail follows the electrode, and, however quickly it moves, the strokes made are neatly engraved on the glass. If the writing or drawing be done slowly, the strokes will be deeply engraved; their breadth will depend on the diameter of the

wire serving as electrode; if it be pointed the strokes can be made extremely fine. Any other source of electricity may be employed instead of the secondary battery, provided the quantity and tension be sufficient—either an ordinary galvanic battery of a sufficient number of cells, or a Gramme machine, or even a magneto-electric machine with currents alternately positive and negative.

The Radiometer as a Thermoscope.—Many of the curious and interesting phenomena of radiant heat are seldom exhibited in public lectures on the subject, inasmuch as the thermopile, which is the only apparatus by which it has been possible to render them evident, is ill adapted for use on such occasions. M. Violle (*Journ. de Physique*, vii., p. 19) recommends the use of the radiometer under these circumstances. With it all the fundamental experiments may be repeated. Passing it along the spectrum, it is easy to show (even with the lime-light) the distribution of heat. The action of coloured glasses, the absorption of heat by water in layers of different thicknesses, and all analogous phenomena, are established without any difficulty. In such experiments an image of the radiometer is obtained by means of a lens upon a screen, and such an arrangement of the radiometer is adopted as will render the turns of the mill easily counted.

Polarisation of Electrodes in a Liquid.—It is well known that when we attempt to pass an electrical current through a liquid from an electromotor too feeble to decompose it, a current is produced whose strength diminishes very rapidly until it becomes extremely feeble. On suppressing the electromotor, a new current is obtained in the opposite direction which also rapidly diminishes. These phenomena present a close analogy to those which a condenser would offer if substituted for the liquid. Regarding the liquid in this light, Herwig (*Annalen der Physik*, ii., p. 566) has investigated, theoretically and experimentally, its capacity and resistance. The capacity was found to be very variable, increasing with the time, both for the current of charge and also for that of discharge. The resistance bore no relation to that which the same liquid would have offered when traversed by a current strong enough to decompose it. From his investigations, Herwig concludes that an electrolyte under these conditions cannot be compared with an electrical condenser.

Temperature of Flames.—M. Rossetti (R. Istituto Veneto di Scienza, 1877; *Journ. de Phys.*, vii., 61) has investigated the temperatures of different parts of an ordinary Bunsen flame by means of a thermo-electric element of iron and platinum. The graduation of the apparatus was effected without difficulty for temperatures below that at which mercury boils. For higher temperatures the author had recourse to a calorimetric method, and in this way constructed a curve of graduation up to 855°C. , which, as it differed little from a straight line, he thought himself justified in prolonging beyond that temperature. In this way he estimated the temperature of the exterior portion of a Bunsen flame at 1350° , diminishing down to 1200° at the limit of the dark central cone, in which, measuring from the bottom upwards, the temperatures ranged from 250° to 650° . It is doubtful, however, whether the indications of the thermo-electric pair could be relied on at such high temperatures.

Determination of the Unit of Electrical Resistance in Absolute Measure.—A tolerably complete account of a very important research on the subject of absolute electrical measurements by Prof. H. F. Weber of Zürich is given in the January, February, and March numbers of the *Philosophical Magazine*. Among other investigations Prof. Weber has determined with great care and by various processes the absolute value of Siemens' unit of resistance, and, consequently, of the British Association unit, or Ohm, since the

relation of these to each other is known. The Ohm was intended to be 10^9 absolute units (centimètre, second), and the Siemens' unit (one metre of pure mercury one square millimètre in section) was found by measurement, by Profs. Clerk Maxwell, Jenkin, and Balfour Stewart, in 1864, to be 0.9536 Ohms. In 1870 Prof. F. Kohlrausch found the value of the Siemens' unit to be 0.9717 Ohms. In each of these researches one method of procedure only was carried out. The elaborate experiments of Prof. H. F. Weber have resulted in the vindication of the numbers obtained by the British physicists. He employed three distinct methods, viz. (1) a method in which the variable currents generated by magneto-electric induction were employed; (2) a method in which the variable currents called forth by sudden voltaic induction were employed; (3) in the third method the heat production of stationary galvanic currents was used. The values obtained for the Siemens' unit by the three processes were respectively 0.9545, 0.9554, 0.9550 Ohms. The mean of these, 0.9550, is only $\frac{1}{4}$ per cent. greater than the result found by the Committee of the British Association. The results of Prof. Weber's experiments leave no doubt that the B. A. unit does really represent the value asserted, viz., 10^9 centimètres per second. Prof. Weber remarks, "When an observer finds the same result in three different ways, and employing three quite different natural laws; when, further, this result but very slightly differs from that of another group of observers who worked according to a fourth, essentially different method, certainly it can be pretty safely maintained that the result so found is correct."

Mechanical Equivalent of Heat.—In the paper of Prof. H. F. Weber above referred to, the mechanical value of the unit of heat is calculated from the results of experiments based on the consideration that in a galvanic circuit, traversed by a constant current, in which evolution of heat is the only action of the flow of electricity, the amount of heat developed is the full equivalent of the work expended in the same time. Both weak currents circulating for a long time, and strong currents circulating for a short time, were employed. The mean obtained from a large number of experiments was 428.15 metre-kilogrammes, temperatures being measured on the air-thermometer. From the relation between the specific heats of atmospheric air the mechanical equivalent is found to be 423.95. In 1849, from friction experiments Joule found the value 424.39, and his more recent experiments confirm this result. Unfortunately, this number cannot be compared with that obtained from the specific heats of air (428.95), since the units of reference are different. An air thermometer was employed in the latter case, whereas Joule's unit of temperature is that of his mercury thermometer. These two temperature units may possibly differ by 1 per cent.

MEETINGS OF SOCIETIES.

ROYAL SOCIETY.—(Thursday, March 14.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On Prof. Houghton's Estimate of Geological Time," by G. H. Darwin; "Some Experiments on Conductive Properties of Ice, made in Discovery Bay in 1875-6," by Dr. R. W. Copping; "On the Function of the Sides of the Vessel in maintaining the state of Super-saturation," by C. Tomlinson, F.R.S.

PHYSICAL SOCIETY.—(Saturday, March 16.)

PROF. W. G. ADAMS, President, in the Chair. The Secretary read a paper by Mr. W. J. Millar, C.E., "On the Transmission of Vocal and other Sounds by Wires." The author was led, mainly by a consideration of the manner in which sounds are conveyed through walls and partitions, to make an extensive series of experiments on this subject, from which he concludes that conversation can be carried on at considerable distances by simply employing stretched wires, provided with suitable vibrating discs. In one

experiment, two copper wires were attached to points on a telegraph wire 150 yards apart, and breathing, singing, &c., were distinctly audible; by stretched wires extending through a house, and provided with mouth and ear-pieces in the several rooms, conversation could be carried on without difficulty. The materials employed for terminals were very varied, and the vibrating disc, whether metal, wood, or india-rubber, &c., was generally formed as a drum-head, the wire being fastened at its centre. The volume of sound appears to be greater with a heavy wire, but in all cases it requires to be stretched. The President referred to the experiments of Wheatstone on the conduction of sound by vibrating bodies, especially long wooden rods. Some years ago M. Cornu, in conjunction with M. Mercadier, made experiments which showed that vibrations can be transmitted along a copper wire, and rendered visible at the distant end on a rotating blackened drum. The free end of the wire was attached to a piece of copperfoil fixed at its base, and provided with a point which left a clear trace on the drum when the distant end was attached to, say, a vibrating tuning fork.—Mr. W. H. Preece described some experiments made, in September of last year, by Mr. A. W. Heaviside and Mr. Nixon, at Newcastle-on-Tyne, on this subject. They find that a No. 4 wire gives the best results. The terminals were wooden discs about $\frac{1}{2}$ -in. thick, and to these the wire was attached end on, but speech could be distinctly heard by laying such a disc on any intermediate point of the wire. When the wire was particularly still speech was audible up to 200 yards.—Mr. G. W. von Tunzelmann then read a paper on "The Production of Thermoelectric Currents in Wires subjected to Mechanical Strain." He has succeeded in reconciling the contradictory conclusions arrived at by Sir W. Thomson and M. Le Roux, for whereas the former only used moderate strains the latter worked near the breaking limit, and the author finds that if the weight be gradually increased the direction of the current changes, and hence these two authorities found the currents to flow in opposite directions. A great number of experiments were made, and from them it is evident that on applying a strain the deflection does not immediately attain a maximum, but it gradually rises for about eight minutes and then gradually falls, attaining a stationary point at the end of about twelve minutes.—Prof. Adams then exhibited a simple arrangement for projecting Lissajous' figures on to the screen which has been made by his assistant, Mr. Furze.—Dr. Guthrie exhibited an experiment to show the behaviour of colloids and crystalloids in relation to electrolysis.

ROYAL ASIATIC SOCIETY.—(Monday, March 18.)

SIR E. COLEBROOKE, Bart., in the Chair.—Mr. Thomas called attention to the well-known Phrygian Inscription of Dogarus, and announced his discovery of various dates on it which had escaped the notice of previous enquirers, demonstrating, as they did, a much higher antiquity for it than had previously been supposed.—Papers were then read, communicated by Capt. J. C. F. S. Forbes and by Mr. H. L. St. Barbe respectively; the first "On the Tibeto-Burman Languages," the second "On the Transliteration of Burmese."

ZOOLOGICAL SOCIETY.—(Tuesday, March 19.)

ARTHUR GROTH, Esq., V.-P., in the Chair. The Secretary exhibited the type specimen of *Dicrurus marginatus* of Blyth, and pointed out its identity with *Muscipira vetula* (Fam. Tyrannidae).—Mr. J. W. Clark exhibited and made remarks on some stuffed specimens of the Sea Lion (*Otaria urina*) of the Prybylov Islands, which had been presented to the Museum of the University of Cambridge by the Alaska Commercial Company.—A communication was read from the Marquis of Tweeddale, containing the sixth of his contributions to the ornithology of the Philippines. The present memoir gave an account of the collections made by Mr. A. H. Everett in the island of Leyte.—Mr. P. L. Selater read a report on the collection of birds made during the voyage of H.M.S. *Challenger*, in the Sandwich Islands, and pointed out the characters of a new species of duck of which it contained specimens, and which he proposed to call *Anas Wyvilliana*.—Communications were read from Mr. W. A. Forbes, containing notes on a small collection of Birds from

the Samoan Islands and the Island of Rotumah, Central Pacific; and from Mr. F. Nicholson, containing a list of the Birds collected by Mr. E. C. Buxton, at Darra Salam, on the Coast of Zanzibar.—Messrs. F. Du Cane Godman and Osbert Salvin gave descriptions of new species of Central American Butterflies of the Family Erycinidae.—Prof. A. H. Garrod read some notes on the visceral anatomy of *Lycaon pictus* and *Nyctereutes procyonides*.—A communication was read from Mr. Andrew Anderson, containing the description of a new Indian *Prinia*, obtained in the Bagesur Valley, North Western Himalayas, which he proposed to name *Prinia poliocephala*.

ROYAL SOCIETY.—(Thursday, March 21.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"Contact Theory of Voltaic Action—Parts I., II., On a Metallic Cell and on Electrolytes of great Resistance," by W. E. Ayrton and J. Perry; "On the Viscosity of Dielectrics," No. 1, by the same; "Recent Experiments on Fog Signals," by Dr. Tyndall.

CHEMICAL SOCIETY.—(Thursday, March 21.)

DR. GLADSTONE, F.R.S., President, in the Chair. The following papers were read:—1. "On Aromatic Nitrosamines," by Dr. O. N. Witt. The author gives an account of his study of some complicated reactions of diphenylnitrosamine. He has found that ordinary ethylic nitrite contains nitric acid, and has therefore used mixtures of pure amyl nitrite and nitric acid for acting on diphenylamine; he has obtained mononitrodiphenylnitrosamine in light-yellow plates, melting at 133.5° C., and two bodies which on the removal of their nitroso-groups yielded two isomeric forms of dinitrodiphenylamine. The final product of the action of strong nitric acid is hexanitrodiphenylamine.—The next paper was "On a New Process for the Volumetric Estimation of Cyanides," by J. B. Hannay. The cyanide is dissolved in water, and the solution rendered alkaline by ammonia. A standard solution of mercuric chloride is run in, with constant stirring, until the liquid is distinctly opalescent. The final reaction is sharply marked and very delicate. The presence of silver does not interfere, so that the process can be used for estimating the cyanide present in a plating bath.—The last paper was, "On certain Bismuth Compounds," Part VII., by M. M. P. Muir. The author has compared the behaviour of bismuthous and phosphorous chlorides in certain reactions; the latter substance acts as a reducing agent in some cases in which the former does not exert any such action. The author has also studied the properties of two oxalates of bismuth and the production of the so-called bismuthates, and made some experiments with bismuthous iodide.—Mr. Williams exhibited a fine sample, 24 oz., of natural salicylic acid, and about one gallon of pure methylic alcohol.

SOCIETY OF ANTIQUARIES.—(Thursday, March 21.)

F. OUVRY, Esq., President, in the Chair.—Mr. John Evans, V.-P., read a paper upon "Edmund of Langley, Duke of York, fifth son of Edward III., and his tomb which stands in the church of King's Langley." The manor of King's Langley, in Hertfordshire, was granted by William the Conqueror to his half-brother, Robert Earl of Cornwall, and seized by King Henry I. from his heir. From this time it continued to be royal property until the Commonwealth period, when it was leased by the Parliament to Sir C. Morrison, and finally came into the possession of the Earl of Essex. It was first used as a royal residence by Henry III., and his three successors frequently sojourned there. A celebrated house of Friars Preachers stood near the palace, to which both Edward II. and Edward III. were benefactors. The corpse of Piers Gaveston was buried in the church of this house, after having been kept for two years at the house of the same order in Oxford; and the tomb which is the subject of this paper also originally stood there, being removed to the parish church after the suppression, probably during the reign of Elizabeth. It was at first placed in the chancel, but in last November was removed to a memorial chapel built in the north aisle expressly to receive it. After giving an account of the life of the duke, Mr. Evans proceeded to describe the tomb, which is a stone altar tomb, six feet six inches long by two feet six inches wide,

covered with a slab of Purbeck marble, which does not belong to it, but has been an altar slab. It is surrounded on three sides by shields bearing the arms of Edward the Confessor, St. Edmund, Wenceslaus Emperor of Germany, France and England, differentiated with various labels for the sons of Edward III. and Henry IV., France and England, impaled with Castile and Leon, for Isabel of Castile, the duke's first wife, and the arms of the Hollands Earls of Kent and Exeter, and Fitzalan Earl of Arundel, relations of Joan Holland, the duke's second wife. As no directions concerning the tomb occur in the duke's will, the tomb was probably erected in his lifetime, and as one shield bears a coat which was only used by King Henry IV. between the death of his father and his own accession, it is most likely that the year 1399 is the date of its construction. On examining the interior of the tomb during its removal, three skeletons were found, one enclosed in a sheet of lead, the others loose, the tomb being filled with loam and gravel, in which were fragments of wood, the remains of coffins. The skeleton in the leaden coffin was that of a lady about thirty years of age, with flaxen hair. This could not be Isabel of Castile, who was about forty when she died; nor Joan Holland, who, after the duke's death, married three other husbands, and died at the age of fifty-one; nor Constance, his daughter, who was buried at Reading. It might, perhaps, be the remains of Anne Mortimer, widow of Richard, Earl of Cambridge, the duke's second son, the grandmother of Edward IV. Another of the skeletons was that of a woman about four feet six inches to four feet eight inches in height, and about thirty-five years of age, which corresponds with what is known of Isabel of Castile. The last skeleton was that of a man of great strength, five feet eight inches in height, and from 55 to 65 years of age. There can be no doubt that this is the skeleton of the duke, who lived to the age of sixty-two. Mr. Evans described the bones, which bore traces of wounds, and remarked on the sloping forehead of the skull, as connected with the weak understanding with which he was credited, though he showed no lack of courage, or indeed of natural shrewdness, during his eventful life.—Mr. Chignall exhibited a very fine specimen of a gold torc, used as an armlet, found near Dover; and Mr. Brent exhibited some gold earrings, Roman fibulae, a copper dagger and other articles from Hungary.

FINE ART.

THE EXCAVATIONS AT OLYMPIA.

WE have already published particulars of the progress of these excavations, from the resumption of work for the present season, at the end of September last, down to November 14. The results of the operations during the fourteen weeks between the latter date and February 21 this year are now made known with some fulness in Dr. Treu's official reports. These results have not been nearly as rich or striking, so far as concerns discoveries of sculpture, as those of the preceding period; but they have yielded architectural and minor remains of the most miscellaneous kind in almost bewildering profusion; and they have above all cleared up many points hitherto obscure in the geography of the Altis, including the situation of the boundary wall of the sacred precinct on at least three of its sides, and that of two of the most important structures within the precinct—the Prytaneion and Philippeion.

First of all, in continuation of that search, which had hitherto been so brilliantly successful, for the pediment sculptures of Alkamenes, the diggings to the west and south-west of the temple of Zeus were carried further; these brought to light, on November 19, a new head of a Centaur belonging to the pediment in question: the teeth of the monster are fastened into the arm of a Lapith who grasps him from behind, and the head is described as surpassing even those already found in the qualities of dramatic realism; it had long horse's ears, which have disappeared, though their setting can be traced. From this point, no new fragments of the same composition, beyond

mere splinters, were discovered. A Roman brick wall has been laid bare, running at a distance of about thirty-five yards from the temple in this (S.W.) direction; and the soil on its hither side, so far as it had been excavated, had yielded a quantity of coins, fragments of bronze statues, and dedicatory objects, the inscription of an Olympic winner, and, among other things, a child's arm in bronze of excellent workmanship.

Very numerous fragments of bronze, as well as of the marble sculptures of the pediment, have also been disengaged from among and underneath the great masses of fallen column and entablature which cumbered the whole ground when excavated to its ancient level in the immediate proximity of the temple itself. Of the former, the most interesting (found December 6), is a very archaic inscription in the dialect of Elis, assigned to the sixth century B.C., and referring to the rights of citizenship conferred on a people otherwise unknown, the Chaladrii.

Besides the search among these massive and corroded ruins, the authorities at Berlin had prescribed, as a part of their winter's work, the taking to pieces and examination of those solid defensive walls (so far as they had been laid bare) which, enclosing a space of about one hundred yards square, and abutting on the south-west and north-east angles of the temple, had been raised by squatters of the Byzantine period before the end of the sixth century A.D. These walls are very substantially constructed, the materials being exclusively collected from the squared masonry, drums of columns, architraves, triglyphs, and colossal lions' heads of the ancient temples of the Altis, together with a vast number of pedestals of its ancient dedicatory statues. Among these last have been recovered two which bear inscriptions recorded by Pausanias (vi., 10, sec. 9, and vi., 9, sec. 2), and which carried the statues respectively of two winners in the boys' boxing-match, Telson and Xenokles; the latter the work of the younger Polykleitos. A pedestal has also been recovered from these walls, upon which seems to have been dedicated a statue of the historian Polybius.

Some curious discoveries were also made during the demolition of the network of small tenements which crowd close to the eastern limb of the defensive wall above-mentioned, and are apparently of later date than the wall itself. Thus on December 22 a heap of objects was found in this quarter, indistinguishably rusted together, which afterwards resolved itself into a great earthen jar, with two smaller jars inside it containing coins of Constantine the Great, Leo I., and Justinian, besides caldrons, flasks, and cans of bronze, an iron instrument like a great spoon; and, close by, a whole set of agricultural instruments in iron—sickles, rakes, mattocks, &c. Many graves of the same late population of agricultural settlers have also come to light, constructed in the simplest manner beneath the floors of their tenements, and hardly ever containing ornamental objects of any kind.

Digging lower than the level of these Byzantine tenements and defences, and lower even than that of the Olympian temples themselves, the soil is found to be full of fragmentary remains, especially of bronze; thus, in the bed of an ancient drain or runlet there were found, within a few yards, a number of broken caldrons, tripods, tablets with inscriptions, and especially (January 15) two griffins' heads in the finest style of archaic bronze-work, the larger of them about fourteen inches long.

The works of which we have spoken are all in the immediate neighbourhood of the temple of Zeus. In like manner have been extended the operations of the previous year at and adjacent to the more northerly temple of Hērē.

It has become apparent that the principal entrance of this temple was situated at its south-eastern angle; on the columns at this angle are the traces where a number of inscriptions were let in; and here, in Roman times, were erected a

fountain, and the pedestals of several statues of the notables of Elis, both men and women; these were probably the figures that had previously been found, in a headless state, built into a wall on the east side of the same temple. The inscription of one of these pedestals proves that it carried the statue of a late descendant of Pheidias, one of those established as hereditary custodians and cleaners (*φαιδριῶται*) of the chryselephantine statue of Zeus in the great temple. On January 15 a female portrait head of fine Roman workmanship was recovered from the late walls, composed entirely of drums from the columns of the Heraeum, which run in a double line along its northern flank.

In digging below the levels of the pedestals, water-conduits, &c., of the mature Greek period, in this part of the sacred precinct, another stratum, so to speak, of discoveries is reached, belonging to ruder times of Hellenic civilisation. These consist especially of innumerable small votive figures of animals in bronze—oxen, cows, horses, goats, hares, birds—sometimes so primitive as to be scarcely recognisable, in other cases of the best style of archaic workmanship. A certain number of similar little figures in the cheaper material of clay are discovered among those of bronze.

The works begun last year at the site of the ancient treasure-chambers at the foot of Mount Kronion have been so far extended that the foundations of all the eleven chambers mentioned by Pausanias have been laid bare; but a small male torso in marble is the only work of art as yet discovered in this place.

In addition to the extensions thus far described of works previously begun, the digging has also been pushed in several new directions. A long trench has been conducted from the central excavations at the temple of Zeus, first in an easterly and afterwards in a southerly direction, towards an octagonal brick building of the Roman period which exists near the Alpheios. In this, on November 16, was found the lower half of a square marble pedestal, of which the sides are sculptured in relief in a good style of post-Alexandrian Greek Art, with two subjects of Herakles and another not recognisable. The same trench reveals a continuation, for a long distance in this direction, of the same system of late Byzantine walls constructed of the jumbled fragments of Greek work; and among these fragments, to a distance of over 100 yards from the east front of the temple of Zeus, have been found more belonging both to the *Nikē* and to the pediment sculptures of Paeonios. At about this point of 100 yards west by south of the temple, begin the remains of a Roman mosaic pavement; and a little nearer the temple run two walls of massive masonry, one of which will no doubt turn out to be the eastern boundary wall of the Altis. Its southern boundary wall seems in like manner to have been struck by a trench radiating to the south-west, at a distance of about 110 yards from the south side of the temple. On the west no similar boundary wall had up to last advices been identified with certainty; but on the north a massive wall of masonry had been struck, which promises to be the boundary of the precinct on that side, and should be near the point where, according to Pausanias, was the entrance gate which lay opposite the Gymnasium and between the Prytaneion and Philippeion. The enclosure of the Prytaneion has been conjecturally recognised in a walled space within the Altis, of considerable dimensions, lying exactly north, south, east, and west, and on its north side extending to within six yards of the presumed boundary wall already mentioned. And further to the west have been discovered, past all possibility of mistake, the two concentric foundation walls of the round colonnaded building dedicated by Philip of Macedon after the victory of Chaeroneia, and called the Philippeion. The architectural members of this structure have been entirely overthrown, but are built almost complete

into the fabric of walls raised about and across the site by later settlers, and from among them have been recovered many of the bases which once carried gold and ivory statues of Philip and the members of his family; besides such incidental objects of art as a draped female statue of the Roman period; a marble statuette of Herakles reposing; many votive animals and other fragments of bronze, including one small female figure, archaic in style and very richly draped; a couching lion sculptured in calcareous stone (found February 16); and two important early inscriptions in bronze.

THE CAMBRIDGE REMBRANDTS.

MODERN facilities of travel have enabled the Cambridge Rembrandts, or such of them as are to be dispersed, to make the "grand tour," like a last-century nobleman, during the past fortnight; and, having been duly inspected by the amateurs of ancient prints in Berlin, Brussels, Frankfurt, and Paris, they have now returned, and are at this moment on public view at the auction-rooms in Wellington Street. The Fitzwilliam authorities are greatly to be commended for their resolve to sell them. Nothing can be more needlessly burdensome to a great public collection than the forced retention of a mass of objects which it does not want, which imposes upon it the responsibility attached necessarily to the possession of things of considerable money value, and which, if once well sold, enable the collection to enrich itself from other quarters. The sale is wholly praiseworthy, and one wishes in some respects that the British Museum were free to follow now and then in the steps of Cambridge, though, of course, such freedom would be dearly purchased if purchased at the cost of losing valuable bequests, many of which, it may be assumed, are only made to a great national institution on the understanding that the contents of such institution are for ever inviolable. At the same time, though we would by no means have power granted to the authorities to sell everything that might be displeasing to them, or that might appear to them superfluous, and though we are sure that they would never seek for any such power—it might be remembered that in the matter of ancient prints there is an easily fixed limit to the wants even of a national collection. For the connoisseur who is wanting to make delicate comparisons, and for the thorough student of the art of the artist, a national museum should contain the best available impression of each state of every plate, but one impression only of each state; and for the chance visitor or occasional student who needs only to have set before him the subject of the work rather than the finest example of it, a national museum should contain, separately arranged, one cheap example of a late state of every plate. Duplicates of the same state are, as a rule, superfluous; and it is these that the Cambridge authorities have been minded to sell, and these that will be sold next Tuesday and Wednesday "by Grace of the Senate of the University."

The collection is very extensive, very valuable, and sufficiently rich in rarities. It bears upon it at the same time, one must have the frankness to say, the marks of its origin or of the circumstances under which it is dispersed. It is the leavings, the rich leavings, the "remainders," as a publisher would put it, of a vast public museum. It is not a collector's collection, and it contrasts in this respect necessarily unfavourably with the superb collection of Sir Abraham Hume sold not quite two years since at Christie's. Sir Abraham Hume appears to have been an ideal collector. His collection was deficient only in insignificant pieces—pieces with small artistic merit. It did not specially abound in rarities, though it contained nearly all the rarities which are at the same time possessions to be desired for their beauty. Its strength was in its splendid representation of the art and genius of Rembrandt

by the most carefully-chosen impressions of the noblest subjects. Judged by this standard the Fitzwilliam collection of duplicates is undeniably found wanting. Subjects which the wealthy private collector would be determined to have represented by the finest possible impressions are represented by impressions for the most part indeed quite untampered with, but not always of the richest or most brilliant. Subjects which no intelligent collector would be content to be without, subjects sometimes not specially difficult of attainment—the *Mère de Rembrandt au voile noir*, for instance, and the smiling portrait of the artist's mother "lightly etched," as Wilson correctly describes it—are wanting to the assemblage. Wanting to it also is such a triumph of impetuous art as the *John Lutma*: such a triumph of delicate portraiture as the *Jan Six*. Nor is the world-famous print of *Christ Healing the Sick* to be found in the collection. Again, here and there a good impression, such as that of the *Ephraim Bonus*, has lost a part of the paper that rightly belongs to it—a loss which the compilers of the catalogue have been at pains expressly to state. But again, here and there, the compilers, with every desire to describe the quality of the impressions guardedly, have perhaps carried their admiration of one impression over to the credit of another. I doubt whether the impression of the superb landscape, the *Cottage with Dutch Hay-barn*, will be found on re-examination "very fine"—at all events as against the two exhibited last year at the Burlington Fine Arts Club—and a margin of an eighth of an inch can only be inadvertently described as a "good margin." (See No. 343—*Rembrandt's Head, and other Sketches*.) But in dealing with so very many lots, it would have been remarkable if there had been absolutely no inaccuracies in description.

What are the good points of the collection, apart from its general qualities of extensiveness and of intact condition? It has, in the first place, several great rarities, such as the *Spanish Gipsy*—an impression of which in the Hume Collection sold for 70*l.*, despite the comparative unattractiveness of the subject—and such as the little *Landscape, with a House and Large Tree by it* (Wilson, 204): one of the few landscapes in which the artist has occupied himself not only with the permanent lines of the country but with passing "effects." It has the greatest of all possible rarities: a subject which, as it is stated, has never, within the amateur's record, appeared at a sale—a sheet of studies (Wilson (253), and No. 238 in the present sale catalogue), which coming to the British Museum with the Orcherode Collection was supposed to be unique. Cambridge, however, had two impressions of it; and one of these the Fitzwilliam naturally and necessarily retains, while the other is offered to whatever public museum or private collector yearns for it the most. A bit of coppice and some palings or planks, very thickly printed, hardly constitute its main attraction. In stray corners of the plate there are two heads of men, with quite the character of the master; and above the coppice there is a back view of a horse, a beast of burden, and certainly one of the most life-like representations of a strongly-built animal in all the work of Rembrandt. At the same time, it cannot be pretended that the artistic interest of the print is of the greatest. If it did not exist, the world, it is wholesome to reflect, could well afford to be without it; but as it does exist, it will engage the rivalry not only of private amateurs but of public institutions, and will reach undoubtedly an extravagant price. Fortunately, in its possession of a fair number of good impressions the collection has more substantial claims to admiration than can be conceded to it by reason of its good luck in including a sheet of studies always before deemed unique.

Among the "portraits of Rembrandt," there seems to be a very good impression of that spirited little plate (Wilson, No. 2) which is sup-

posed to represent the artist in comparatively early life—just the small rounded head, with its cap, and dark moustaches. There are several fine examples of sacred subjects. The little *View of Amsterdam* (No. 248 in the present catalogue) appears fine: and the subject in itself is always admitted to be one of the daintiest specimens of Rembrandt's art. The great *Three Trees* is well represented. A *Peasant carrying Milk-Pails*—one of the smaller landscapes—is represented by a rich impression from the collection of the great early French collector, Mariette. There is a singularly fine impression of the *Goldweaver's Field*, a landscape in which Rembrandt has pushed to the furthest point his great characteristic virtues of abstraction and selection. Among the portraits not certainly identified, there are no less than two good impressions of that delightful half-length of a lad, supposed at one time to be the son of Rembrandt, but now more generally associated with a prince of the House of Orange; and there are also no less than two good impressions of the keen little portrait of a mean-faced woman, hard of life and sour of temper, known to readers of Wilson under the scarcely descriptive title of *Head of an Old Woman etched no lower than the Chin*. The sale of all these things will probably prove that the market in which Rembrandt is "enquired for" is too wide a one to be much affected by English rumours of war or of adversity within these seas. FREDERICK WEDMORE.

ART SALES.

ON Saturday Messrs. Christie, Manson, and Woods sold several small collections which included many valuable works. The collections were the property of the late Mr. Graham White, of the late Mrs. Edward Romilly, and of the late Lady Anne Baird. The most notable picture was one that had belonged to Mr. Graham White, who, it is stated, was the grandson and heir of the late Sir G. H. Smyth, Bart., of Berechurch Hall, Essex; and the picture exhibited at the Royal Academy, 1787, and then half a century ago at the British Institution must have been, when originally painted, among the finest specimens of the handiwork of Reynolds. It is engraved by Bartolozzi, and represents Lady Smyth surrounded by her children; it was sold on Saturday to Mr. Graves for 1,312*l.*, and those of our contemporaries who appear surprised at the price would seem to have allowed the condition of the picture to weigh with them more than its artistic virtues. This very lovely example of Sir Joshua's art was indeed severely damaged, but we venture to opine that had this not been the case it would hardly have fallen for any sum short of twice that which it realised on Saturday. A portrait, said to be by Rembrandt, and to represent *Rembrandt's Wife*, sold for 472*l.* The work was undoubtedly fine, and it may very possibly be Rembrandt's; but the connoisseur's knowledge of the face of Rembrandt's wife is already sufficiently assured to justify him in doubting whether the wife of Rembrandt ever suggested to the painter of this picture the subject here realised. A second work of Sir Joshua Reynolds reached the comparatively insignificant sum which alone seems generally attainable by the President's portraits of men. *The Marquis of Granby*, from the collection of the Duke of Buckingham, at Stowe, and engraved by S. W. Reynolds, fell for 173*l.* (Smart). An important, and to many persons attractive, picture, by Jean Baptiste Greuze, *Madame van Westreman de Trémant*, painted as late in the career of the artist as 1802, reached 304*l.* (Sawyer). We note, in addition, *A Welsh River Scene*, with ruined castle, by R. Wilson, R.A., 152*l.* 5*s.* (King); *The Coronation of the Virgin*, attributed to Murillo, a large upright picture from the Wynn Ellis collection, exhibited at Leeds, 84*l.* (Denison); *Windsor Castle*, attributed to Turner, a small work, 37*l.* 18*s.* By Hogarth, *A Fair*, with a Charlatan

and other figures, from the Redleaf collection, 152*l.* 15*s.* (Denison). By J. Opie, R.A., *The Studious Child*, 26*l.* 5*s.* (Denison). By Hoppner, *A Portrait of Mrs. Berkeley*, 63*l.* (Sedelmeyer). By Bonifaccio, or attributed to that master, *The Raising of Lazarus*, a large gallery picture from the Pesaro collection, 63*l.* (Ellis). By Weenix, *A Horseman*, with a group of peasants with cattle, near a Roman ruin, 52*l.* 10*s.* (Johnson). By, or assigned to, K. du Jardin, *Portrait of a Gentleman*, in a black dress and white collar, 26*l.* 5*s.* (M. Colnaghi). By Mireveldt, *A Portrait of a Gentleman* in a lace collar and white and gold dress, dated 1609, 33*l.* 12*s.* (Lewis); by the same, *Portrait of a Lady*, the companion picture, 44*l.* 2*s.* (Lewis). By Hondikoeter, *Poultry in a Landscape*, 162*l.* 15*s.* (Denison). By W. Marlow, an early painter of our London streets—*London Bridge*, 53*l.* 11*s.* (Gibbs). By the same, *Florence from the Arno*, 79*l.* 16*s.* *View of the Bay of Naples*, by Marlow, 75*l.* 12*s.* (Johnson). By A. Pynacker, *A River Scene*, with figures in a boat, 34*l.* 13*s.* By F. V. Mieris, or attributed to him, *The Sick Lady*, 165*l.* 18*s.* (Lesser). By A. Van der Neer, *A Landscape*, with travelling peasants, twilight effect, 273*l.* (Wertheimer). By D. Teniers, *The Guitar Player* and other figures, a small oval on panel, 10 in. by 12 in., 567*l.* (Lewis). By A. Ouyp, *The Flight into Egypt*, a sunny lake scene, 304*l.* 10*s.* (M. Colnaghi). Among the water colours there was a sufficiently good example of Copley Fielding, *London from the Thames*, 178*l.* (Agnew); by Frederick Taylor, an example of his much sought-for animal pictures and pictures of the chase, *A Boar Hunt*, 110*l.* (Agnew); by T. M. Richardson, a view of *Menaggio*, on the Lake of Como, 105*l.*; by Peter de Wint, an elaborate and finished example, *A View of Lincoln*, 761*l.* (Vokins). The total sum realised at the sale was but little short of 9,000*l.*

NOTES ON ART AND ARCHAEOLOGY.

A PICTURE by the Brescian painter, Gian'Giro-lamo Savoldo, has been acquired for the National Gallery. It represents a young woman in half-length bending forward to the left, and enveloped in a white silk veil, which covers the head and partly shadows the face. She looks out towards the spectator. In the nearer background are ruinous buildings, and a small vase is placed upon a stone before a door-like aperture. The distance recalls the shores of the Venetian Lagoons. The dawn breaks from behind a cloud-bank, and tinges with a dark ruddy glow the bars of cloud that streak the deep blue sky above. Until lately this picture was in the Casa Fenaroli at Brescia, where it had long been known under the title of "La Zingara," and ascribed to Titian. But for many years past its true authorship has been recognised. It fully answers to the description given by Ridolfi of a painting by Savoldo which in his time was in the Casa Averolda at Brescia, and which that author designates as a *Magdalen going to the Sepulchre*; and as it is beyond any reasonable doubt the same work, Ridolfi's appellation has been retained. The present picture, and one in the Museum at Berlin, are obviously variations on the same motif: but they differ in the cast and colour of the drapery, the components of the background, and somewhat in the attitude of the figure. The vase, too, as well as the distant view, are absent in the Berlin example. But the latter has the advantage of bearing Savoldo's rather rare signature.

WE are only able this week to mention the death of Sir G. Gilbert Scott, R.A., which occurred on the 27th inst., at the age of sixty-six.

MESSRS. DOULTON AND Co. got together, and submitted to inspection from March 21 to 23, an important collection of art and other pottery, at their new buildings, Albert Embankment, Lambeth, prior to its removal to the Paris Exhibition.

THE most recent edition of the *Imitation of Christ* (Chapman and Hall)—albeit bound in colours and with a style not, to our thinking, in the best ecclesiastical taste—is yet one of the most attractive editions of this time-honoured masterpiece of reverent thought which has appeared either here or on the Continent. It has several illustrations which are above the average. So remarkable an engraver as Charles Waltner has reproduced in his own art the graceful design of Delaunay suggested by the text, "He that followeth Me shall not walk in darkness;" and Jacquemart—a still more remarkable master of the art of the aquafortist—has rendered with extreme delicacy and suavity a design of Leonardo of the head of Christ. The tender reverie which characterises this study makes it a fitting accompaniment to the perusal of the written meditations of the devout A. Kempis. Nor have such minor adornments of an art volume as head and tail pieces, chosen print and chosen paper, been neglected by the publishers of the present issue.

WE have received from Messrs. Colnaghi and Co. their new mezzotint, engraved by Mr. Atkinson from a portrait of Lord Beaconsfield painted not long ago by Prof. H. von Angeli, and the property, we believe, of Her Majesty. No fault need be found with the engraving, but the picture itself would appear to be not specially attractive. A great painter, or any keen student of men, would have found in the veteran statesman a subject of higher artistic interest than the learned Professor has been able to discover in him.

MR. LANGTON BARNARD has completed a portrait of Miss Kate Pattison for the Royal Academy. The lady stands in a garden, with a dark gray wall behind her partially covered with ivy. A distant view to the right through the iron gate is a noteworthy feature of the picture.

A NEW illustrated magazine of art, in which the Fine Arts in all their branches will be fully represented by pen and pencil, will shortly be commenced by Messrs. Cassell, Petter and Galpin. *The Magazine of Art* will contain notices of all contemporary art matters, notes on current exhibitions of pictures and other works of art, together with essays on various artistic subjects by eminent writers, and will be illustrated throughout.

THE *Basler Nachrichten* says that M. Doret, of Vevay, is now exhibiting in his *atelier* the monument which is to be erected in Venice over the grave of his famous compatriot, the Neuchâtel painter, Leopold Robert. It is said that the monument of Leopold Robert is now standing in the very same workshop in which the cradle of Alexander Calame used to rest in the beginning of this century. The latter painter was the son of a stonemason, who according to legend, must have sometimes brought his infant to his workplace.

IT is complained that a number of serious injuries have been done to the old glass paintings of the Cathedral of Lausanne by the carelessness of the workmen engaged upon the restoration of the building. A window illustrated with the arms of the different towns of the Vaud has received the greatest damage.

THE Queen has been pleased to accept a copy of Mr. J. Dafforne's illustrated volume, *The Albert Memorial: its History, Description, &c.*, recently published.

THE death is announced of the distinguished archaeologist M. Emmanuel Roulez, Rector of the University of Ghent, who was born at Nivelles in 1806. He contributed many papers to the *Mémoires* and *Bulletins* of the Belgian Academy, to the *Messageur des Sciences Historiques*, and the *Annali* of the Archaeological Institute of Rome, as well as to various French and German Reviews. He also translated several German works, including Schöll's *Manual of the History of Greek Literature*, and published a *Cours d'Antiquités romaines* (Brussels, 1849). He was a

corresponding member of the Academy of Inscriptions.

IT appears from a note communicated to the *Zeitschrift für bildende Kunst* by R. Bergau, the biographer of Veit Stoss, in Dohme's publication, *Kunst und Künstler*, that this clever but disreputable Nürnberg artist not only worked in wood and stone and as an engraver and engineer, but that he likewise executed works in metal which he cast himself. This is evident from a commission given to him in 1514 by the Emperor Maximilian for certain brass figures, against the execution of which the Nürnberg metal-founders (*Rothgässer*) protested, as interfering with their rights; but the Rath begged of them "to let it be for this time," as otherwise "they would be showing disfavour to his Majesty." This "unquiet citizen," therefore, who was always giving a paternal Rath a great deal of trouble, not only got permission to cast his figures, but was also at his request accommodated with a foundry for the purpose. It is supposed by Herr Bergau that some of the statues on the tomb of the Emperor Maximilian in the church at Innsbruck were by him.

TWO splendid bronze groups, representing each a panther with the figure of a faun or satyr posed against it, have just been purchased, according to the *XIX^e Siècle*, by M^{me}. Adolphe de Rothschild, out of an old palace in Venice where they have lain ignored until now. These works are so full of power as to be attributed by many critics to Michelangelo; in any case they belong to the highest period of Italian Renaissance, and it is interesting to learn that M^{me}. Rothschild has consented to their being exhibited in one of the *salles* of the French Exhibition in order to afford artists an opportunity of judging their merits. It is stated that M^{me}. Rothschild has paid 350,000 francs for these two bronzes—almost their weight in gold.

SEVERAL rooms that have hitherto been closed in the Museum of Versailles are to be opened to the public from May 1. These rooms contain as many as 1,000 historic portraits, dating from the foundation of the Monarchy to 1790.

IN spite of several efforts that have been made of late years towards improvement in bookbinding, artistic taste does not seem to have developed in this branch of industrial art nearly so quickly as in others. Though far less serviceable, the covers of our books, with a few exceptions, remain just as ugly as those of our fathers and grandfathers, or, indeed, more so, for glaring atrocities in the shape of bright blue, green, mauve, and magenta cloth have taken the place of the dull-grey boards or dun-coloured calf of former time. These cloth-covered volumes of ordinary use are not only objectionable because they regularly come apart if much read, but also because when placed on the bookshelves they often disturb the harmonious effect of the whole room by their startling incongruities of colour. Nor is it much better with more solidly bound volumes. Unless they are so plain as to be simply inoffensive from absence of all attraction, they are generally loaded with gilt ornamentation or patterned over in the worst possible taste. Only now and then do we find anything that aims at beauty or artistic device on the outside of the volumes we read. Such being the case, it is satisfactory to learn that a work entitled *Modern Bookbinding*, having for its object the improvement in workmanship and taste of the binding of books, is now being brought out by the eminent bookbinder in Leipzig, Gustav Fritzsche. The first number of this publication contains six excellent designs for book-covers, all drawn by accomplished artists. These designs show what may be done in the way of rendering the outsides of books attractive, whatever may be their contents. They are protected by pattern-copyright from reproduction; but it is stated that the

permission to use any one of them may be purchased for the sum of forty marks. Designs of all kinds, however, would quickly be forthcoming if only the demand for them were created.

AN illustration is given in *L'Art* of an elaborate piece of decorative sculpture which was contributed by Gustave Doré to the Exhibition of the Place Vendôme. It consists of a tall figure of Night in a star-bespangled robe, standing on a base of clouds and cherubs, and holding a large circle of stars above her head. It is intended as a design for a torch-bearer; and as an ornamental work doubtless has a rich effect. It is not remarkable, however, for originality. It may be supposed that the artist is devoting all his strength in sculpture to the great work symbolising *Youthful Genius Stified by Death*, which, as we have before stated, he is preparing for the forthcoming Universal Exhibition.

IN the *Zeitschrift für bildende Kunst* this month, Herr Otto Benndorf writes upon the Greek clay figures discovered at Tanagra. Herr J. von Falke, in a second article, finishes his study of the metal work and jewellery of the East; Dr. Semper, the recent biographer of Donatello, contributes a learned disquisition on the Church architecture of the Renaissance, or, as he calls it, a "Comparative Study of some of the Ground-plans of the Churches of the Renaissance;" Mr. B. Atkinson reviews at some length Crowe and Cavalcaselle's recent work on *Titian and his Time*, and several more letters are given of the voluminous correspondence between Bonaventura Genelli and Karl Rahl. This correspondence, however important it may be from the point of view of the art-historian, has not much personal interest, and most readers of the *Zeitschrift* will probably be glad when it is ended. An etching by Eissenhardt of Eekhout's portrait of the Dutch geographer Oliver Dapper forms the frontispiece of the number.

THE new number of the *Gazette Archéologique* gives an engraving (plate 2) of the mural painting discovered at Pompei in 1875, representing the death of Laoköon in a manner which, according to the writer in the *Gazette* (M. Fivel), differs materially from that of the well-known marble group in the Vatican. In the picture Laoköon wears the dress of a priest about to offer a sacrifice. Behind him the bull for the sacrifice is alarmed at the new phenomenon. Farther away a group of young men look on in fear and astonishment. Laoköon is on the steps of the altar, and with his left hand is endeavouring to hold away from his throat the head of a huge serpent which coils round his body. One of the sons lies dead before the altar; the other, a little to the side, has sunk on his knee, and is struggling with a smaller serpent. Still, the attitude of Laoköon himself in the picture is essentially the same as that of the marble group, and hence the question has arisen whether both the painter and the sculptor may not have copied from one and the same original, the differences being such as would be required or permitted by the different conditions of the two arts. The painter could afford to render many circumstances of the incident which the sculptor could not give except at a loss. For instance he could give Laoköon his proper robes as a priest, and he does not require to group the two boys close to the father. And yet with these and other differences his work may be such as to show that the artistic conception of the subject with which he started was not his own, but had originated with a sculptor. This seems to be generally admitted, and the only question at issue is whether this original conception was or was not identical with that of the marble group of the Vatican. Either way it could only be a matter of opinion until evidence was forthcoming of some other representation in sculpture proceeding from a different original. M. Fivel believes he has found this in a bronze statuette in the Louvre of which he gives an engraving. It is certainly an

interesting object, and an important addition to the material of this much debated question of the Laoköon. But that its differences are such as to justify its being regarded as a new type of that figure in sculpture, is open to doubt. Among the other plates in this number of the *Gazette*, is a bronze statuette of Silenos Kriophoros in the attitude of the Hermes of Tanagra.

THE STAGE.

RECENT PLAYS.

MR. GILBERT'S withdrawal of his unfortunate play, the *Ne'er-do-Well*, and his resolute determination to amend and render it more acceptable to audiences at the Olympic Theatre, is perhaps a unique example of prompt confession of failure on the part of a dramatist, unaccompanied by the slightest token of discouragement. It is manifest that in this case the author believed in his play, notwithstanding his sense of the justice of the condemnation which it received from the dramatic reviewers and the public; nor is there anything abstractedly impossible or even improbable in the notion that the *Ne'er-do-Well* had failed from defects purely incidental, and easily to be remedied: for the history of the stage abounds in instances of pieces that have broken down on representation for reasons more or less trifling in themselves. But though much of the offence lay in the proceedings of Mr. Gilbert's minor characters, the want of truth and delicacy that was so strongly felt by his audience was deeply seated in the relations of his hero and heroine both with each other and with the little world around them. The spectacle of the reformed vagabond pleading to the woman he passionately loves and who passionately loves him, not on his own behalf, but on that of his young friend, who is in no way worthy of her and in no degree acceptable to her feelings, necessarily shocked the common-sense of the spectator and disturbed his faith in the reality of the scene. It seems hardly possible that the author could have fully considered all that was involved in this strange situation of affairs. That a young gentleman but lately in a degraded, fallen state should be requested by a benevolent employer to make love to a young and comely lady, on behalf of his son, was surely in itself something strange. It wore, at least, the appearance of a rather desperate expedient, and was hardly consistent with the assumption that either father or son possessed much hold upon the young lady's respect or affection. But the benevolent employer is most unnecessarily frank about his motives. He tells his *employé*, Mr. Rollestone, again and again that the reason of his great anxiety is the circumstance that the lady's fortune is absolutely essential to the support of his establishment and to save him from impending ruin. Of course he has no suspicion that his young secretary has long been deeply attached to the lady, or that it was owing to the measures taken by her friends to separate them and forbid them to communicate that Mr. Rollestone had lost heart for the battle of life and sunk into the condition of the ragged, penniless outcast which he appears for a moment in the first act. But Rollestone at all events knows all this. He is perfectly well aware that of all impulsive young men and private secretaries in the world he is the least fitted for the delicate and eccentric duty thus pressed upon him. He is disqualified by the circumstance that he is a young man, and a mere dependant and paid servant of Mr. Seton's; and also by reason of his own feelings, which no amount of self-restraint can be expected to conceal. He is disqualified because he has no reason to believe that the young lady's old regard has undergone any change, as, in fact, it has not. He is disqualified because, whether her affection had survived or died out, it must still be painful to her to listen to him, of all persons, on such a subject; and, lastly, he is disqualified because the lady's own happiness and

well-being, and not the mercenary schemes of a designing relative, ought to have been the object of his first thoughts. And what has Rollestone to plead as his motive for imploring the young lady to bestow her hand upon the wrong man? Nothing, except the fact that he, not she, is under obligations to Mr. Seton and his son.

It strikes one almost as a designed satire upon the strained and unreal sentiment of this position when we find Rollestone in the new third act which Mr. Gilbert has written, rather saucily defying his generous patron, and desiring to know how far the favours he has received justify his employer (or rather late employer, for Rollestone's failure to fulfil his mission faithfully has led to a prompt dismissal), in talking so loudly of obligations conferred. After all the *ne'er-do-well*, or the vagabond, as he is called in the new title of the play, must be assumed to have descended in the social scale rather from lack of the will than of the power to avoid degradation so complete. He is a man of education and abilities; his connexions are good; his worst fault seems to have been a temporary loss of honourable ambition. What then, it may be asked, had Mr. Seton done but offer him employment with a salary which could not be honourably accepted if the services rendered were not equivalent, and if they were no less than equivalent could not possibly confer any very great obligation? To weigh a kind and well-meant offer in this sort of strict balance would no doubt have been mean if Mr. Seton had asked from his secretary only some amount of self-sacrifice; but it would certainly have been justifiable when the act required involved the peace of mind and worldly advantage of Miss Callendar.

Not a few of these and like considerations must have been in the minds of those who were present at the performance of *The Ne'er-do-Well*, while Miss Callendar, with somewhat unwomanly frankness, was unmistakably hinting, then candidly confessing the true state of her affections to the lover who, in the interests of his exacting and mercenary patron, was entreating her "for God's sake" to "let the old time go by," and bestow her hand and fortune upon an ineligible suitor. This scene the author has not been able to dispense with, or even to modify in any appreciable degree. It is the very keystone of his story; and it is for this reason that his scheme of reconstruction really represented from the first a hopeless task. It is a curious circumstance, however, that Mr. Gilbert himself seems to have been so little impressed with the objections to an incident of this kind that in his new third act he has, for the first time, introduced a similar scene. Here it is the lady, Miss Callendar, who following her now happy lover Rollestone's example, pleads to the man she has jilted on behalf of the pretty Jessie O'Hara. She is more successful, it is true, than Rollestone was; but, though her rejected suitor, Gerard Seton, is altogether but a poor-spirited creature, it is hardly to be conceived that he could have felt flattered by the perfect readiness exhibited by Miss Callendar to hand him over for life to another lady.

Against fundamental defects of this kind, one or two clever conceptions of character can avail little. Truth, and adequacy of motive, and consistency of conduct are the first requisites of a play; for the absence of these qualities rarely fails to be discovered, or being discovered to be destructive of the interest that an audience might otherwise feel in its story. Unfortunately it is in these particulars that *The Vagabond*—in a less degree, it is true, than *The Ne'er-do-Well*, but still in a considerable degree—is found wanting.

The opinion that Mr. Irving's Louis XI. will take rank among the most deservedly popular of his impersonations has been even strengthened since the first performance of this play at the Lyceum Theatre. It is a character pre-eminently suited to his genius, which has affinity rather to the weird, the terrible, and the grotesque than to

the tender or pathetic, and which seems never to attain its highest power save when the imagination rather than the feelings of an audience is to be moved. It is this faculty of appealing to the imagination through the actor's own imaginative power, which renders this impersonation distinctly greater than the late Mr. Charles Kean's famous performance of the same part. There are of course the same violent contrasts, and absence of subtlety, and obviousness of purpose in the means employed to produce given effects. All these indeed belong to the portrait as painted by the original author, M. Delavigne, who had no other conception of revealing a complex character than that of building it up as it were from without in a series of antitheses, after a fashion which has been in favour with historians as long as history has been written. Hence there is in his old king really nothing to be discovered; no depths of motive to be sounded; much less is there ground for speculation such as in the case of Shakspeare's personages is so often found extending even beyond the limits of the action of the play. To tell the truth, this is but a shallow piece of workmanship; but it has the advantage of being intelligible to most orders of mind. Its broad and somewhat coarse strokes were found serviceable by Mr. Kean, who nevertheless played the part in a far more uniform key than Mr. Irving does, and did not exercise the peculiar fascination which is felt by Mr. Irving's audiences. There has recently appeared a medical criticism upon Mr. Irving's death-scene, which condemns this part of the performance apparently on the ground that no surgeon would be able to write out the diagnosis of the disease from a study of this scene, or to determine what kind of medicine or purgative stuff is "exhibited" by Mr. Irving's peculiar symptoms. But the actor is quite right in neglecting to attend clinical lectures and confining himself to the actor's business in these matters, which is not to be true, but to seem true, or as nearly true as is consistent with his object of exciting the imagination of the spectator, and suggesting the ideas that are to be conveyed. It is the king's strong will—ininitely stronger than his feeble body and failing faculties—strong enough indeed to seem to keep death itself at bay, while he clutches still at his sceptre, and strives to enjoy to the last the old exercise of power—this it is that Mr. Irving has here to pourtray; and it cannot be denied that the scene moves his audience in an extraordinary degree. In expressive play of feature, which is so needful on this occasion, he is wholly unrivalled. The part, in Mr. Kean's hands, was essentially melodramatic; as played by Mr. Irving it becomes invested with a terrible sort of ideality, and assumes far grander proportions than anything we are accustomed to associate with the name of melodrama.

A writer in the *Saturday Review*, discussing the merits of the recent performances in London of Herr Moritz, the Hungarian tragedian, calls attention to the curious circumstance that dramatic criticism in our newspapers is subject to strange and unaccountable vicissitudes of fashion, inasmuch that the views expressed in one season regarding a particular performer or style of acting will sometimes be found at another season to have undergone a considerable change. There seems to be some amount of truth in this complaint; and it is certain that dramatic reviews in our papers are much too prone to take the form either of indiscriminate condemnation or of no less indiscriminate praise. But Herr Moritz, as this writer justly observes, has not only been generally condemned, but has been censured in some quarters with a degree of violence and rudeness which, even if the actor's efforts were utterly vain, is not to be admired. When a foreign actor of some reputation coming among us essays to represent a character in a play of Shakspeare in the original words of the poet, our national reputation for courtesy to strangers, if we have any, seems to require that his merits should be handsomely acknow-

ledged. But the truth is that Herr Moritz's appearances caused a very sudden and a very general sense of disappointment; and this feeling was deepened by the fact that expectation had previously been wrought to a high pitch by the means of bespeaking attention to his merits employed by his friends. Some time before his appearance at the Queen's Theatre papers were privately circulated among those who are known to take an interest in entertainments of the stage, setting forth the extraordinary favour with which Herr Moritz had been received in numerous continental cities and towns lying far and wide between Pesth and Stockholm. Particulars were also given of the imperial, royal, and noble personages who had expressed themselves highly satisfied with his acting, and had been pleased to bestow upon him their hospitality. All this had possibly engendered an unconscious spirit of opposition; for a critic may have but a humble and diffident opinion of his own judgment, and yet may resent an attempt to overpower his senses by the mere weight of authority or by the prestige of dazzling associations. Even the writer in the *Saturday Review*, however, though generously anxious to say all that can honestly be said in favour of Herr Moritz's recent performances—and it should be remembered that it is these performances, and not anything he has done elsewhere and under different conditions that have been criticised here—does not get much beyond the point of that "faint praise" which we have authority for regarding as sometimes more damaging than advantageous. When he expresses the opinion that "the most unfortunate of the actor's defects" is "an imperfect cultivation of his powers" he seems rather to suggest what may be the cause of defects than to indicate the defects themselves. I confess that Herr Moritz appeared to me to fail more from lack of power than from neglect of study. His painstaking attention to what the players call the "business" of his parts has been elsewhere noted—not exactly as the *Saturday Reviewer* seems to have inferred, by way of complaint, but as an answer to those apologists who have attributed Herr Moritz's failure to please entirely to the circumstance that his impersonations are so widely different from anything seen before on our stage that the critical mind is thrown off its balance. The "traditions," as they are called, of a leading character in an old play represent the cumulative results of the examination of the text by great players in the past; they may have a presumption in their favour even when their special authority may not at once be obvious; and to discard them without good and sufficient reason is to incur the risk of being censured for presumption. Nevertheless, a great and original actor is expected to give some impression of freshness and of power; and these qualities could hardly fail to be accompanied at some point in the play by actions less familiar to our eyes than Shylock's act of leaning on his stick or sharpening his knife to take the forfeit of his bond. When this impression is wanting, it is not the custom to describe a performance, however good it may otherwise be, by any more flattering epithet than "respectable" or "creditable." Such being, unhappily, the case with Herr Moritz's two impersonations, it was desirable in the interests of dramatic art and honest criticism that something of this kind should be said, without discourtesy but also without equivocation or reserve; nor does it seem that the "considerable reputation" which Herr Moritz is considered to have gained upon the German stage imposes on English critics any duty but that of holding their unfavourable opinion modestly, while taking care to allow no extraneous circumstances to influence their judgment.

MOY THOMAS.

MR. W. G. WILLS has given to his new play, founded on the *Vicar of Wakefield*, the title of *Olivia*. It will be produced this evening at the Court Theatre.

MR. TOM TAYLOR's historical play, *Clancarty*, originally produced at the Olympic, has been revived at the St. James's, where Miss Ada Cavendish and Miss Emily Fowler sustain their original characters.

A NEW farcical afterpiece, entitled *A National Question*, in which Mr. Toole and Mr. Collette appear, has been produced at the Globe Theatre. The author is Mr. Robert Reece.

MUSIC.

ONE of the most perfect performances possible of Mendelssohn's poetical and lovely overture to *Melusina* opened the concert at the Crystal Palace on Saturday. The orchestra was also heard at its best in Haydn's genial symphony in G, known as "Letter V," and in the overture to the *Freischütz*; while the strings gave a highly finished reading of the variations from Beethoven's fifth quartett, played, after a fashion to which we have often taken exception, by all the strings in the orchestra. Mr. Oscar Beringer, the pianist of the afternoon, brought forward Rubinstein's fifth concerto in E flat. The work had only once before been heard in this country—at one of the Philharmonic concerts of 1876, when the solo part was played by the composer. A second hearing confirms the impression at first produced; its difficulty is only equalled by its ugliness and dulness. An exception may be made in favour of the slow movement, which is not unpleasing; but the first allegro and the finale we find it quite impossible to like. It is a pity that Mr. Beringer did not select music more worthy of his abilities; but it would be doing him an injustice not to say that he played magnificently throughout. There is probably no more difficult concerto for the piano in existence; but it was performed with a clearness, a finish, and an unflinching energy that deserve all recognition; while the accompaniments under Mr. Mann's direction left nothing to desire. The vocalists on Saturday were Mrs. Mudie-Bolingbroke, one of the most promising of our young contralto singers, and Mr. Santley.

The most important performances at the Adelphi, under Mr. Carl Rosa, during the past fortnight have been those of Wagner's *Flying Dutchman*, which was given on Wednesday week, and repeated last Monday. It will be remembered that in his previous season at the Lyceum Mr. Rosa made an enormous success with this work. Owing to the changes in his company, several important modifications have been made in the cast this season. Mr. Santley as the Dutchman is replaced by Mr. Ludwig; while Madame Blanche Cole undertakes the part of Senta, previously sung by Mdle. Torriani. It was a severe test for Mr. Ludwig to sing in a character so associated with the performances of our great English baritone; but he achieved a most complete and well-deserved success. He had previously been known as one of the most painstaking and conscientious of Mr. Rosa's company; but he fairly surprised his audience by the dramatic power which he threw into his impersonation; while his singing of the very difficult music was above reproach. The Senta of Madame Blanche Cole was also an excellent performance; on the first occasion Madame Cole seemed somewhat indisposed, but on Monday last she showed herself fully equal to the requirements of the part. Mr. Packard as Eric, Mr. Aynsley Cook as Daland, Mr. J. W. Turner as the Steersman, and Mrs. Aynsley Cook as Mary, completed a cast which for perfection of *ensemble* could certainly not be surpassed, and probably not equalled in this country; while the band and chorus acquitted themselves of their difficult share of the performance in a most admirable manner. It is most satisfactory to find that without a "star company" Mr. Rosa can produce operas such as the *Flying Dutchman* in a manner which to lovers of music is far more gratifying than the more elaborate and ostentatious renderings to which we are accustomed at the Italian opera houses. On

Thursday evening, too late for notice in this number, the *Marriage of Figaro* was to be given with a very strong cast. Of this we shall say a few words in our next issue.

At Mr. Shedlock's Chamber Concert at the Victoria Hall, Bayswater, on Wednesday evening, a "Schubert Night" was given, the first part of the programme being selected from the works of the great Viennese composer, and comprising his piano trio in E flat, Op. 100, the Fantasia, Op. 15, for piano solo, and two songs. The miscellaneous second part included among other things Goldmark's Suite, Op. 11, for piano and violin, E. Prout's piano quartett in C Major, Op. 2, and two violoncello solos by M. Lütgen.

The fourth concert of the Philharmonic Society took place at St. James's Hall on Thursday evening; when the Eroica symphony, the overtures to *The Tempest* (Benedict), and *Der Freischütz*, and Wagner's "Huldigungsmarsch" were the orchestral numbers of the programme. Señor Sarasate was the instrumental soloist, selecting Mendelssohn's violin concerto for performance; and Mdle. Thekla Friedländer and Herr Henschel were announced as vocalists.

IN the ACADEMY of the 2nd inst. mention was made of a new invention for sustaining the sounds of the piano, recently patented by Messrs. Kirkman and Son. On Monday last a private performance on the so-called "Melo-piano" was given at Messrs. Kirkman's warehouse, when an opportunity was afforded of judging of the success of the invention. There can be no doubt that the new mechanism furnishes a great addition to the resources of the instrument; the effect produced was at times such that the hearer could almost fancy that a harmonium or American organ was being played in unison with the piano. The tremolo arising from the rapid repercussion of the hammers on the strings would, no doubt, after a time, be likely to pall upon the ear; and the new mechanism requires to be used with taste and judgment; but in the hands of a skilful player many charming effects can be obtained by it. It should be added that its action and management are so simple as to present no difficulty to a pianist of average attainments, while it is so arranged that it can be used or not at pleasure.

MDME. ROSSINI, the widow of the great composer, died on the 22nd inst., at Passy, at the age of seventy-eight.

LITERATURE.

The Constitutional History of England in its Origin and Development. By William Stubbs, M.A., Regius Professor of Modern History. Volume III. (Oxford: Clarendon Press, 1878.)

THIS one compact volume really consists of four elaborate works, modestly denominated chapters, any one of which, published by itself, would have made the reputation of a less distinguished author as a first-rate authority on the subject of which it treats. The first chapter (which is chapter xviii. of the whole work) is devoted to the political history of the struggle between York and Lancaster; chapter xix. treats of the relations of Church and State; chapter xx. of parliamentary law and usages; and chapter xxi. of the social and political influences prevailing at the close of the Middle Ages. Taken together these chapters give a complete account of all that bears upon constitutional principles, and their practical application alike in Church and State, during the period of the later Plantagenets. This volume also completes Mr. Stubbs's History, the death of Richard III. being the limit which he has himself prescribed as the term of his invaluable labours.

As a constitutional historian no one will for a moment deny that Mr. Stubbs is far more satisfactory than Hallam. Yet on the whole he walks very much in the same path, and allows the same general notions to govern the whole plan of his book. The popular idea of the Constitution at the present day is the basis on which both he and Hallam build. Everything that tended in the direction of our present institutions was progress; everything that tended in another direction was the reverse. The genius of the English Constitution, as understood in these days, is perceptible from the beginning; it is traced in the Saxon Witenagemot, and even among the Germans as known to Tacitus. The whole course of our national history speaks thus of repeated attempts to vindicate an ideal which must have been always more or less present to the nation's mind, and which at last stands pretty clearly developed in this happy nineteenth century.

Now, it is beyond my province to enquire how far such a view is justified by the *Germania* of Tacitus and the constitution of Saxon Councils; for these subjects belong to a previous portion of the work with which we are not here concerned. But I must say that I am strongly of opinion that during the period treated of in this volume the national progress was not in the direction of our modern ideal at all, but of some-

thing totally different. As a matter of fact it is confessed that an era succeeded which was much more like absolutism than popular government; and if any real progress had been made in the true principles of liberty, it is extraordinary that it should have been suddenly lost on the accession of the House of Tudor, so that a whole century passed away before the nation began again to move in the right direction. How such an effect was produced Mr. Stubbs is saved the trouble of enquiring by the fact that he drops the curtain at the battle of Bosworth; but surely it must have been the same in the Tudor era as in all eras whatsoever, that the crop produced in that age was sown in the age before it. If, then, parliamentary government had been making real progress and the power of the commons increasing during the fourteenth and fifteenth centuries, how came it that their growth was so suddenly checked, and the onward march not only arrested for a while, but turned into a positive retreat?

Mr. Stubbs, indeed, takes a wiser view than Hallam took before him and than others are disposed to take nowadays. He admits, at the beginning of this volume, that the age of which it treats—from the deposition of Richard II. to the accession of the Tudors—exhibits little if any progress in the development of the powers of Parliament, so that a positive decline in the succeeding age is not altogether so paradoxical. Yet he holds that the rule of the House of Lancaster, at least, was constitutional, and of course a very great improvement upon that of Richard II. Indeed, he holds that this was the source of its weakness—that “constitutional progress had outrun administrative order,” and that “perhaps the very steps of constitutional progress were gained by reason of that weakness of the central power which made perfect order and thorough administration of the law impossible.” Constitutional progress, then, it would seem, is not in itself a source of strength, and too much of it may lead to a positive break-down. One would imagine that whatever could be called real progress in the building-up of a Constitution would be the best possible support to that government under which such progress had been achieved. But constitutional progress under the House of Lancaster, we find, leads to no such result. It is merely “a premature testing of the strength of the parliamentary system,” ending in failure as a political experiment and ruin to the dynasty by which it had been attempted.

Now this mode of stating the case is objectionable as tending to bolster up certain popular delusions which a careful study of the facts ought rather to dissipate. When Mr. Stubbs speaks about “constitutional progress” it is in reference to constitutional principles as they are understood at the present day, not as they were understood at the time of which he writes; and to balance what he says on this head he shows that there was a want of “governance” under the House of Lancaster which led to its being ultimately set aside. This defect, moreover, he attributes very justly to the weakness of the central power—that is to say of the King himself, either in re-

gard to his title, as in the case of Henry IV., or his capacity to rule, as in the case of Henry VI. But he gives it to be understood that the outer parts, so to speak, of the Constitution were getting stronger all the while that the central power was weak—a fact, if it be one, almost as extraordinary as that the circulation in the arms or legs should be strong while the action of the heart was weak in the human body. Surely, wherever there is want of “governance,” it implies that a Constitution is really weak even in its most vital part.

But is it true that, owing to the weakness of the crown, there was a real development of the powers of the House of Commons? On what evidence, for instance, is it asserted (p. 485) that “the two Houses of Parliament had, at least since the accession of the House of Lancaster, been fully recognised as co-ordinate, equal, and mutually independent assemblies?” Mr. Stubbs gives no authority for the statement, and it seems rather as if he were inferring the status of the House of Commons under the Lancastrian dynasty from what he knows to have been its status at a later period. Surely it would have been more reasonable to infer its status then from what he knows about it at an earlier period. Parliament, in our modern sense of the word, as consisting of King, Lords, and Commons was an institution very little over a hundred years old when Henry of Lancaster came to the crown, and the form of the writ by which the Commons were first summoned shows clearly that while bishops and lords were called together to deliberate, the Commons were only to listen and to execute whatever was agreed upon. By what steps could they have risen in so short a time from this abject position to a level of equality with the House of Peers? No doubt the financial wants of kings had begun to tell; but we hear nothing as yet of threats being used to stop supplies. No doubt, also, the House of Commons had already exercised the right of impeachment, and had otherwise taken at times a very prominent part in acts of State; but it was only by express encouragement or instigation from their superiors. The “Good Parliament” was not “good,” except that they were assured of the support of the Black Prince; the “Merciless Parliament” was not merciless, except at the instigation of a party among the Lords. And so far as any evidence exists in the records of Lancastrian times, it seems to me quite at variance with Mr. Stubbs's assertion that the two Houses were then equal and mutually independent.

From the case of Speaker Thorpe, for instance, it is quite evident that even in the days of Henry VI. the privileges of the lower chamber were entirely in the keeping of the House of Peers. And this is a case quite free from ambiguity or suspicion of undue influence and intimidation. Never was a greater anxiety shown to obtain a strictly judicial decision. Speaker Thorpe had been arrested in 1453, during the parliamentary recess, at the suit of Richard, Duke of York. The action was for trespass; Thorpe was cast in damages of 1,000*l.*, and he still lay in prison in the following Feb-

ruary when Parliament reassembled. The Commons at once petitioned for the liberation of their Speaker, as without him they could not proceed, and also of another member who was incarcerated at the same time. The Duke of York's counsel, in the Lords, opposed the application, explaining the circumstances of the case. The Lords, being anxious to preserve the liberties and privileges of the Lower House, asked the opinion of the judges, and the judges made a very careful reply. They declared

"that they ought not to answer to that question, for it hath not been used aforetime that the justices should in any wise determine the privilege of this High Court of Parliament; for it is so high and so mighty in its nature that it may make law, and that that is law it may make no law, and the determination and knowledge of that privilege *belongeth to the Lords of the Parliament*, and not to the justices."

They only added that there was no existing form of procedure to quash all processes against privileged members; otherwise privilege in such cases as treason, felony, and other serious offences would be a manifest interference with justice; but that in minor cases a member arrested was allowed to make his attorney and attend in Parliament. On this opinion the Lords determined that Thorpe should remain in prison, and the Commons were commanded to elect another Speaker.

Now, to talk of equality, whether it be in matters of legislation or in anything else, between two Chambers of which the one is the sole guardian of the privileges of the other, is simply absurd. The reasons given by the justices themselves for refusing to determine the question of privilege show distinctly (what is obvious, indeed, even on a moment's consideration) that the question of privilege is inseparably bound up with the power of making laws; and the recognition of the House of Peers as the true court to judge of the privileges of the Commons implies clearly that the House of Commons was not even in those days regarded as a real legislative body, or at least that it was only a subordinate one. One power no doubt it had which gave significance to its proceedings and became the foundation of its future greatness; but even that was a power enjoyed in theory by every subject in the land. That power was simply the right of petition. The Commons had a perfect right to petition the king and his lords for such administrative reforms as they thought good; and besides promoting petitions in their own name, it appears that they received and forwarded petitions presented to them by others. A bill in Parliament in fact was, when it originated in the Commons, only a petition to the king to make a law, which was sometimes granted, sometimes refused, and sometimes led only to a qualified acceptance. But the common petitions of the Lower House had a significance that could not be overlooked; and they were, as Mr. Stubbs remarks, the sources of most of the legislation of the Middle Ages.

This right of petitioning was therefore for the most part encouraged by the Plantagenets, especially by the wiser kings. It was more convenient, in fact, that the petitions of their subjects should come to them through

the Commons in Parliament assembled than that they should be laid individually at the foot of the throne. But the recognition of such a right implied that it was the duty of the House of Commons to sift out all petitions that were frivolous or improper in their nature, and not allow them to proceed further; and the case of Haxey in the days of Richard II. shows how severely this responsibility might be brought home to them. A bill had been introduced into the Lower House complaining of the extravagance of the king's household, in which a number of bishops and ladies with their suites were continually maintained. It was presented as one article, along with other petitions, to the lords; when the king, hearing of it, took great offence, and caused a reprimand to be conveyed to the Commons by the Peers. He also ordered the Duke of Lancaster to demand of the Speaker the name of the person who had delivered it to the Commons. The Commons most submissively disclaimed all intention of giving offence; they knew that such matters appertained not to themselves; and they at once gave up the original bill and the name of its author, Thomas Haxey, a prebendary of Southwell. The Lords then declared that any one who incited the Commons to seek reforms which touched the king's person should be considered a traitor, and as such, sentence of death was pronounced against Haxey in Parliament. It is some satisfaction to believe that there was no intention of carrying it into execution, for Haxey received a pardon shortly afterwards; but the Commons were sufficiently warned that the right even of petition had its limits.

It is true that the judgment against Haxey was annulled, both on his own petition and on that of the Commons for the protection of their liberties in the first Parliament of Henry IV. It is true also that the case is unique. There is no other instance of the Commons apologising so abjectly, or even being called on to apologise, for the manner in which they exercised their right of petition. It was the policy of Henry IV., on the contrary, to encourage it. Showing himself in this as much as possible a different man from his predecessor, he courted popularity, and even did ostentatiously, at the request of the Commons, some things for which he declared that he himself saw no necessity. Especially so in this very matter of the royal household, from which, at their request, he dismissed his own confessor and two gentlemen of the chamber, declaring frankly that he saw no reason for their removal, but that he was quite ready to get rid of any person whatever that was objectionable to the people. Apparently this encouraged the Commons to be more valiant still; for they next desired, notwithstanding the king's recent marriage to Joan of Navarre, the removal of all aliens, especially such as adhered to the Antipope, and of all French, Bretons, Lombards, Italians, and Navarese, whether they were schismatics or not, except only the queen's daughters and one Marie Sante, with two men-servants and their wives. Even with this request the king complied so far as to agree to a Committee of Lords being appointed who made some slight further relaxation in order to allow the queen the ser-

vices of a few other attendants; and so the matter was settled.

Now, to casual observers instances like these may seem to justify the popular philosophy. The Commons, it will be said, were acquiring a right of control in public affairs, and even in the matter of the royal household. But if so, the right was developed in an amazingly brief period of time; for it was actually within seven years of their ignoble submission in the case of Haxey that they made these two important representations to the king touching the composition of his household. Moreover, their remonstrances were crowned with marked success in both instances. Never surely did constitutional rights spring up with such a mushroom development as this. It is clear, however, from this circumstance alone that these things are not evidence of native power in the House of Commons at all. They were simply due to the fact that it suited the policy of Henry Bolingbroke to show himself condescending. After all, even the great petition about the aliens does not appear to have been responded to in the exact terms of the demand; but the matter was settled in a Committee of Lords, to which it was referred by the king, and whose suggestions, for anything we know, were never referred back to the House of Commons at all.

In short, it is sufficiently apparent that according to the Constitution as it existed in the days of the House of Lancaster, the Commons had really no power at all, except what the King and the Lords chose to allow them. And this is a fact that can be clearly justified even by the book before us. It is, however, a serious misfortune that popular theories usurp so much the place that is due to strict historical truth, and that constitutional historians themselves do not see the full force of the facts which they themselves have brought to light. Mr. Stubbs might certainly have done more to dissipate some prevalent delusions. Unfortunately, as I cannot help thinking, he has not quite succeeded even in emancipating his own mind from them. But what he has done is invaluable. He has at least thoroughly surveyed the whole ground. There is absolutely nothing material to the subject that he has not investigated, and investigated with perfect candour. Whatever may be said of his generalisations, his facts are perfectly trustworthy, and even one who differs from his point of view may really be content to rest the whole controversy on statements made by himself. There is no fear, certainly, that the work will be superseded for many a long day—if, indeed, it ever can be superseded—as a perfect magazine of facts relating to constitutional history in the Middle Ages.

JAMES GAIRDNER.

Les Bords de l'Adriatique et le Monténégro.
Par Charles Yriarte. (Paris: Hachette, 1878.)

ILLUSTRATED books of travel may for the most part be divided into two classes—those in which the illustrations are intended to aid the narrative, and those in which the letterpress is subservient to the illustrations.

It is not derogatory to M. Yriarte's splendid work to say that it is rather of the latter character than of the former, for it contains 257 wood-engravings by good artists, some from photographs, some from nature, and some after the author's sketches. Many of these are on a large scale and in the first style of art, and among them we may signalise those of the buildings in Venice as specially well-executed. The author's plan is to describe that city and some objects in its neighbourhood, and then, passing to Trieste, to follow the eastern shore of the Adriatic, with occasional excursions into the interior, visiting in succession Istria, with its important city of Pola, famed for its Roman amphitheatre and for being at the present day the great dockyard of the Austrian navy; the Quarnero, as the gulf and islands are called which intervene between Pola and Zara, forming the eastern boundary of the Istrian peninsula; and the coast and islands of Dalmatia as far as Cattaro, which place serves as a starting-point for an excursion into Montenegro. Then, returning to the western side, he conducts us to Ravenna, to Ancona, and the neighbouring shrine of Loretto, and finally by the Italian coast to Brindisi and Otranto. In all this route there is nothing very new, nor does it lead us into remote countries. The illustrations, too, are rather for the lover of the picturesque than for the antiquary; and, for our own part, we would willingly sacrifice some of the views and groups of figures here represented for specimens of the Venetian domestic architecture which is so characteristic of the Dalmatian cities, or for the cathedral of Sebenico with its barrel-roof of stone slabs, or for the almost unique town of Curzola on the island of the same name. In like manner, though a certain (rather fictitious) unity is given to the work by its describing a tour round the Adriatic, we cannot help regretting that it did not confine itself to Venice and its former dependencies on the coasts of that sea, which present a very complete subject for historical and antiquarian treatment. But, not to grumble at what we have not got, we may fairly say that even from a scientific point of view something may be learned from the various types of face represented, and the art-student will welcome the delineations of ornaments and minute descriptions of costumes; while the general reader, for whom the book is specially intended, will linger delighted over views of quaintly-built towns and romantic mountain-scenes. Unfortunately, the letterpress does not correspond to this character, and we fear that for one person who will read it with any care there will be ten who will prefer the less intelligent proceeding of looking at the engravings instead. It is excessively long, and very miscellaneous in its contents. When we meet with lively chitchat, as we do in the part relating to Venice, we gladly welcome it; but the greater part is composed of statistics, topography, history, description, and personal narrative in great detail—all most valuable elements, and almost indispensable in an instructive book of travels, but hardly palatable unless carefully compressed and skil-

fully arranged. Those, however, who take the trouble to peruse it will carry away a complete idea of the countries visited, and of the life of their various races. It should be added that the author's style is lively and agreeable, and that he has travelled widely, so that he is able to draw on a large amount of experience for his observations.

It is, of course, impossible in a review like the present to notice more than a few of the places of interest that are here described; but, as a specimen, we may mention Spalato, which represents imperial Rome on the Adriatic, in the same way as the exarchate lives for us in Ravenna, and the succeeding period in Venice. This palace-city—for the greater part of the present town is enclosed within the area of Diocletian's palace, whence its name—creates a profound impression of the grandeur of Rome, when a building of such magnitude and splendour could be erected by an emperor as a retreat for the remainder of his life after his abdication. For an accurate description of its architectural details, the reader is referred to the great work of Adams, *Antiquities of Diocletian's Palace*, published in the last century; but M. Yriarte, besides a ground-plan, gives us excellent views of the sea-face, with its curious combination of ancient walls and columns and commonplace modern shops and dwellings, and of the central court, surrounded on three sides by a portico with granite columns, on either side of which are temples of Jupiter and Aesculapius, now converted into churches. The streets of the modern town, which are interspersed with fragments of the original Roman work, are excessively narrow, and are paved with flags; and so, as in all the Dalmatian coast-towns, which have these same features, no carriages or beasts of burden are allowed to enter. Its subsequent history is told by the Lion of St. Mark which appears on the fortifications, for, with the single exception of Ragusa, which maintained its independence to the last, all these cities became subject to Venice, whose influence in the matter of art, at all events, remains in the graceful marble balconies and staircases which constantly meet the eye. On passing outside the walls we at once meet with the Morlach peasants, of whose costumes M. Yriarte gives us several specimens, for in Dalmatia, while the coast is Venetian in language and culture, the interior is purely Slav. An account is also given of the excavations lately made at Salona, Diocletian's birth-place, accompanied by representations of sarcophagi which have been discovered there.

But the portion of the volume which is most likely to attract attention at the present time is that relating to Montenegro. The approach to that country from the Adriatic by the Bocche di Cattaro, that remarkable winding fiord of Southern Europe, is admirably adapted for pictorial treatment, and nothing can be better than the view here given over its winding reaches, and the villages that fringe its shores at the foot of the steep mountain sides, as seen from the zigzags of the Scala di Cattaro, as the road is called which leads to the Montenegrin frontier. The same may be said of the views in Montenegro itself, though they do

not extend far beyond the environs of Cetinje; but when the reader has studied the engravings of that village with its little plain and envolving mountains, its palace and its monastery, and likenesses of the Prince and Princess and their children, of various heroes of the late war, of senators and guards in costume, and of peasants, male and female, from various districts of the Principality, together with scenes illustrating the life and customs of the people, and has perused the copious narrative by which these are accompanied, it will be hard if he does not find that the country, its inhabitants, and its institutions are familiar to him.

M. Yriarte is somewhat careless in the matter of names. "Ylliricum" for Illyricum (p. 3) is evidently a slip; but the author of *Highlands and Islands of the Adriatic* was not "Peaton," as he is twice called in this book, but Paton; and the English translator of Servian poetry was not Sir John "Browning," but Bowring. These and similar inaccuracies, however, are unimportant, and hardly detract from the value of this beautiful work, which will be an ornament to any drawing-room table, and will afford, we doubt not, a great deal of pleasure.

H. F. TOZER.

Life and Letters of James Hinton. Edited by Ellice Hopkins. With an Introduction by Sir W. W. Gull. (London: C. Kegan Paul & Co., 1878.)

"*Beau roi de l'avenir, que fais-tu ici?—Je brave le présent.*" These emphatic words of Quinet's are applicable to many, but to none more truly than to the subject of the present memoir. James Hinton, we learn, was the son of the Rev. Howard Hinton, a Baptist minister, born at Reading in 1822. So that he was but fifty-three when, in December, 1875, his career of intense practical and intellectual activity was closed by death. But in that time he sowed a seed of moral and intellectual regeneration for society which will not soon cease bearing its fruit. He has contributed much towards realising that which is the end of the great struggle of modern times, the bringing-science, philosophy, and religion into a perfect accord; and that not merely for the philosopher at his desk, but for all men and women as practical actors in the great drama.

Active and practical as his own life was, much as he mixed with men, "roughing it" indeed in the world rather more than falls to the usual lot, yet there is little apparently to tell of incident and adventure. At any rate, the main interest of his career does not lie in its outward events but in the inward development of his mind. The real interest is a philosophical one. Hence the present memoir consists chiefly of letters and extracts from MSS. in which that development is depicted. We are presented, of course, with a narrative of the events—his situation as cashier at Whitechapel; his entering the medical profession; his voyage to China; his two years in Jamaica; his practice in London; his married life, a golden thread running through the whole; his working with Mr. Toynbee in aural

practice, and afterwards as his successor; above all the struggle is recorded which it cost him to give up philosophical speculation and devote himself entirely to his practice, which he did for the eleven years from 1863 to 1874 (pp. 200, 331), and with such success as to attain the first rank in his branch of the profession, and to leave a work which is its recognised text-book (p. 333).

But all this is interesting to the public at large, mainly as being in part the condition, in part the result, of his inward life and development; in part the *result*, inasmuch as he distinctly and constantly chose the line he would take from a sense of duty, or in his own phrase, of *service*. This has been clearly seen by his biographer, or as she modestly calls herself, editor; who has restricted herself mainly to setting Mr. Hinton before us from his own letters and his own sayings, which are his best interpreters. One graphic picture of him, however, she has given us, which those who have known him will assuredly recognise as life-like:—

"It is difficult to give any adequate idea of the charms of Mr. Hinton's conversation to a mind at all in harmony with his own. His most marked peculiarity was the intensely emotional character of his intellect. Nature, to him, was no cold abstraction, no cunningly contrived machine made up of matter and force, but a mighty spiritual presence, a living Being, tenderly and passionately beloved. The laws of nature were to him the habits of a dear and intimate friend. It was not the artist's delight in nature, nor even the poet's, but a combination of the poet's and scientist's which was quite unique. He would apply to some of the delicate mental operations by which her secret processes are traced out, the kind of epithets that are more commonly used for objects of natural beauty—pretty, elegant, delicious—while his action was often as if he were tenderly handling some exquisite living thing that he held in his grasp, and on which his gaze was intently fixed" (pp. 217-18).

From this passage it is well to turn to the excellent portrait by Mr. Jeans, which is prefixed to the volume. The few clear words of Introduction, too, by Sir William Gull, bring out well the kind of questions with which Hinton was chiefly busied—namely, questions not of a scientific but of a philosophical order. On the practical side, the relation between the sexes and the condition of women generally seem to have been that which, throughout his life, engaged his deepest attention. "Do you call English life monogamous? Explain to me—I don't understand. Are we speaking of names and pretences or of realities? The problem is not how to keep, but how to attain to monogamy" (p. 284). And again, in a very characteristic passage:—

"If I am to be remembered at all, this is what I would be remembered by, that I was the man who said, 'Man is so made that he can rise above the sexual passion, and subordinate it to use.' There, even if that is false, and all else I ever said was true, I would rather be remembered as having said that one falsehood than by all the truths" (p. 285).

In that last sentence we have *Faith* caught in the act, in the very moment of rebound from earth.

Characteristic also is the incident, related by the friend who was with him at the time, of his touching address to some women at

the Alhambra, ending with the words "If our Saviour were on earth, where would He be? Why here." "And then we left, and my dear friend wiped tears from his eyes" (p. 296).

In fact, if any man ever *lived* his philosophy, that man was Hinton. Or rather let us say, since this may convey a false suggestion, not that he lived his philosophy, but that his philosophy was the creature of his life. His moral needs, sympathies, impulses, made room for themselves; burst the sod, like a seed in spring-time, and grew out into a philosophy at once practical and speculative. He was a living instance of the "practical reason" moulding the intellectual theory, by bringing new phenomena, new facts of consciousness, within its ken.

But let us turn to what we can gather from the book before us concerning that philosophy. It is with no sort of surprise that we find, both that Coleridge was the writer who in early days most influenced him, and also that a few years sufficed to obliterate the details even of the book (the *Aids to Reflection*) which had exerted the influence (p. 40). Coleridge's calling the Will the spiritual in man was what remained. "It wasn't reason led Coleridge to say that. It was religion—it was inspiration" (p. 73).

Hinton thus began with a spiritualistic hypothesis. He soon placed a materialistic one by its side—namely, that of the underlying identity between organic and inorganic matter, whereby on the one hand all matter was conceivable as *living* (p. 115); and, on the other, organic growth was formulated as a case of motion in the line of least resistance (pp. 154-5).

This, however, was but a first step towards his final theory. What that theory was may perhaps be best learnt from the letter to Prof. Croom Robertson at pp. 111-118. This whole material and tangible world, he held, was as purely *subjective* as those qualities are admitted to be which clothe it with sound, odour, and colour. The question is, he writes, "Can we or can we not transcend the conceptions imposed by this particular sense of touch?" (p. 232). In other words, is there or is there not an existence beyond, and other than, the tangible physical world?

Now to this question he applied a logic which he had before applied to the previous question of organic and inorganic matter; the conception, namely, of a "deadness," that is, as he explains (p. 233), a "defective apprehension" in us. There is some want or failing *in us*, which makes us see and feel the material world as itself a *reality*, whereas it really is the appearance or *phenomenon* of a true, or as he called it an *actual*, world beyond it. Man, he held, ought to endeavour to apprehend this actual reality behind the intelligible world of sense and thought, just as he already has, in his intellectual growth hitherto, apprehended the intelligible world, the laws of motion in solid matter, and corrected by them the illusions of the senses taken alone.

At this point it was that his ethical theories came in to supplement his speculation. The third member in the series, of which

sense and thought were the first two, is moral feeling or emotion. This it is which, in his view, supplies man with the means, and at the same time imposes upon him the duty, of discovering the laws of the true, actual, unseen world. "The true love of God is, I conceive, love of the Infinite Being, i.e., the universal fact" (p. 132). We must learn, he held, to have a "true response to every claim," whether of ourselves or others (pp. 260 *et seq.*); we must learn to *feel* rightly in the presence of "others' needs." We must correct our "defective apprehension" of these things; and his main point is, that this correction of feeling is an attainment of *truth*, since the wrongness in the feeling has been caused by a distinctly nameable obstacle, self-regard, in both its shapes, in that of desire for self-righteousness, as well as in that of simple selfishness (pp. 269-275).

The love of God is the beginning and end of the whole—supplies the moral motive power, supplies the rule, sets free the faculties, reveals the unseen world, welds it with the seen, consecrates and illumines the whole. It is not true, as *man* has said, "that the world is in itself matter and mechanism; but we, from the riches of our spiritual being, cast over it an illusory glow of loveliness and feeling" (pp. 124-5). No. The world *is* loveliness and feeling; we have conceived it as matter and mechanism. We have helped to make it what we find it; we must now help to find it what it is.

What is to be thought of a theory like this? It is a rediscovery of Christianity? Say rather it is *Christ's* Christianity in the dress of a philosophy subsequent to modern science—a philosophy not opposed to materialism, but including it as an *enclave* of its own. Much new subject for thought lies therein. SHADWORTH H. HODGSON.

South Africa. By Anthony Trollope. In Two Volumes. (London: Chapman & Hall, 1878.)

South Africa is a comprehensive title; it is not in the present instance misleading, because we all know pretty well beforehand the limits within which our author will confine himself, and the class of subjects which will most attract him. It was known, wherever he went, that he was going to write a book; and he pathetically describes the attention which he was compelled, by good nature or good manners, to pay to various matters in which he felt but little interest. Thus he listened patiently to the singing of hymns in the native schools, though much doubting whether proficiency in hymn-singing proves a corresponding advance in practical religion, or in useful knowledge. In the same spirit he walked conscientiously through the museum at Cape Town. Mr. Trollope is one of those—alas! that they should be so few—who, belonging to the pre-scientific age, are not ashamed to own their indifference to these things, and he records with special commendation the considerate behaviour of the Astronomer Royal:—"Do you care for the stars?" he asked me. In truth, I do not care for the stars. I care, I think, only for men and women, and so I told him. 'Then,' said he, 'I won't bother you

to come to the Observatory. But if you wish to see stars I will show them to you."

South Africa contains some curious types of "men and women," and we are glad to contemplate them under the guidance of so shrewd and practical an observer and student of human nature. At the same time it is only fair both to ourselves and to the author to bear in mind the hurried character, not only of the journey, but of the work itself, which was written, he tells us, chiefly *en route*, while the impressions he had received were fresh on the mind. "A book so written," he admits, "must often be inaccurate, but it may possibly have something in it of freshness to atone for its inaccuracies." We would not set our own judgment against Mr. Trollope's in this matter. Certainly there is no lack of freshness in the work. His sketches of places or persons, however slight, are full of individuality, and it is remarkable how after a rapid journey through a province, with only a few occasional halts, he is able to seize and present to the reader all the prominent points which characterise its social and political condition. On the other hand the plan has entailed a certain amount of repetition, and the reasoning is not perhaps always as close as it might have been under a more methodical arrangement. And there are other slight blemishes which in the work of a skilful writer no doubt indicate haste.

Mr. Trollope begins with a rapid sketch of the history of the colony from early Dutch times, which is necessary to the right understanding of subsequent events, and of that vacillation which has been so prominent a feature in our dealings with this colony. This vacillation he attributes to the fact that we—the colonising nation *par excellence*—have never had any fixed principles in regard to colonial matters; that while the policy of the Foreign or of the Home Office follows a prescribed and continuous course, whoever may be at its head, that of the Colonial Office depends on the idiosyncrasies of the Secretary of State for the time being.

We think that to some extent the appearance of vacillation may be due to our anxiety to do right, and the consequent tendency to deal with each difficulty as it arises on its own merits. The principle of the Dutch, as of the Spanish, colonial system is simply to extract as much as possible out of the colony for the benefit of the mother-country. The treatment of the natives by the Dutch at the Cape was based on the simple directions given to the chosen people in their dealings with the Canaanites. By acting steadily on such principles it is comparatively easy to escape the charge of inconsistency. With ourselves, on the other hand, as Mr. Trollope humorously asserts, a series of Virtues presides over the deliberations of the Colonial Office.

"They scintillate on the brows of every assistant-secretary, and sit as a coronet on the shining locks of all the clerks. But unfortunately they are always rotatory, so that no one virtue is ever long in the ascendant. *Rule Britannia!* and the Dutch Member of Parliament has to walk out of his Volksaal and touch his hat to an English Governor. *Downing Street and the Treasury have agreed to retrench!* Then the Dutch Member of Parliament walks back again. *We will at any rate protect the Native!* Then the Boer's wife hides the little whip with which she has been

accustomed to maintain discipline over her apprenticed nigger children. *Let those people go forth and govern themselves!* Then the little whip comes out again. Among all these British virtues what is a bewildered Dutch colonist to do? If one virtue would remain always in the ascendant—though I might differ or another—there would be an intelligible policy. If they could be made to balance each other, as private virtues do in private bosoms when the owners of those bosoms are possessed of judgment, then the policy would assuredly be good. But while one virtue is ever in the ascendant—but never long there—the Dutch colonist and the English are naturally bewildered by the rotation."

Mr. Trollope's ideal of a Colonial Minister is "a man who can look forward and say, 'While we can hold these people, for their own content, to their own welfare, so long will we keep them; but not a moment longer for any selfish aggrandisement of our own.'" But more than one of our Colonial Ministers might have said thus much; and the question can hardly, perhaps, be stated quite so simply. The great statesman might, for instance, find the wishes of a colony inconsistent with the general welfare of the Empire; and he might even perhaps discover some *via media* between "holding" a colony and cutting it adrift.

Mr. Trollope points to our treatment of the Dutch seceders from our rule as an instance of the mischief caused by the absence of a settled policy. It was natural that a people cut off from European influences since the end of the seventeenth century, and consequently beyond the reach of those modern philanthropical views, which have after all been held in earnest only in England, should have felt much disgust and irritation at the introduction of a system founded on those views, which abolished slavery, and otherwise curtailed their "freedom" in dealing with the natives. But when they threw off their allegiance and "trekked" beyond our borders, we had, as Mr. Trollope points out, no consistent line of action. Sometimes we followed and reduced them. Those who had reached Natal we allowed to retire again. In the Orange River country and in the Transvaal we allowed them, after a fight, to establish independent States. But when the Transvaal became disorganised, and likely to involve us in dangerous complications with the natives, we annexed the country. A few years ago, when the fortunes of the Orange River Republic were at a low ebb, it would not unwillingly have accepted the same fate, but since prosperity has revived, owing to the stimulus given to trade by the proximity of the diamond-fields, it prefers independence, and this now stands inconveniently in the way of the federation policy which the home Government has adopted. Mr. Trollope is an advocate for colonial confederation, and hoped to be able to recommend its adoption in South Africa, but on closer examination he has been led to think it "inexpedient, and, if expedient, still impracticable," on account of radical differences in the constitution and circumstances of the different provinces. Thus Natal, with its 320,000 natives to 20,000 whites, objects to her few representatives being swamped in a general Parliament by those of the Cape provinces, in whose

electorate there is no distinction of colour, and whose policy might consequently be some day controlled by the black portion of the community; while the Orange Free State, protected on all sides by British territory, with her finances flourishing and her people contented, expresses, sarcastically, her great obligation to Her Britannic Majesty for the independence accorded to her, and altogether declines to renounce it.

The interest created at home by the Transvaal annexation was among the proximate causes of Mr. Trollope's journey, and he enters at some length into the question, arriving at the conclusion that the annexation had become a necessity for the safety of our subjects in Natal, and was, besides, a distinct advantage to every class of people in the territory itself. This being so, it seems hardly consistent to apply so many hard or ambiguous adjectives to the act of Sir T. Shepstone. An official who in a difficult position does not shrink from responsibility is a man whom in these days Englishmen should delight to honour.

On what is probably the most pressing and important of South African questions—viz., the Native question—Mr. Trollope has much to say. He seems a good deal concerned to reconcile our conduct and even our presence in South Africa with "abstract justice;" but he is clear that the gain to the natives is immense—that, instead of dwindling away as in Polynesia or North America, they are rapidly multiplying, from the increased security to life and protection from tyranny; and that the foundations of civilisation are being laid by work and by the creation of new and hitherto unfulfilled desires. He admits, too, that it is a natural and healthy instinct which drives an expanding race from their own country, and as it is inevitable, in that case, that they must go to some one else's country, the argument for our justification seems as complete as in this imperfect dispensation we can expect it to be.

In all discussions about South Africa it is, as our author observes, too often forgotten that it is essentially a black man's and not a white man's country, and that its real affinities are rather with such Crown colonies as Ceylon than with Australia or Canada. Here, indeed, as he points out, is to be found the reason why the white labouring population does not increase. The white man will not work alongside of the black man; he will not do more than superintend the black man's work.

None of the panaceas in vogue for the regeneration of the native—religious instruction, compulsory labour, allocations of land, or Parliamentary privileges—have our author's unmixed approval. As regards the last, indeed, he declares that he would "certainly let the black man have the franchise on the same terms as the white man. In broadening or curtailing the privilege of voting there should be no expressed reference to colour," otherwise "there cannot be that equality before the law without which we cannot divest ourselves of the sin of selfish ascendancy." Yet he is fully alive to the danger of a coloured constituency discovering its power before it is fit to exercise it aright, and to the outrage on common-

sense of a white community being governed by a black one. We do not, therefore, wonder that he questions whether the grant of equal electoral privileges to the population of the Cape provinces has not been premature. Our difficulty is to understand at what stage he would, with these apparently conflicting views, think it expedient to grant them.

But it must not be supposed that Mr. Trollope has filled his book exclusively with disquisitions, however interesting, on such subjects as these. The distances he traversed, as may be seen by the useful map which accompanies the work, were great; and, though he met with no exciting adventures, the narrative is enlivened throughout by the remarks of an observant traveller on the nature of the country, the habits and ideas of the people, and the details of the journey, which involved considerable hardship. We read that consumptive patients are now sent from England to Bloemfontein, the capital of the Orange Free State, but as the easiest route includes a rough coach-journey of six days, averaging thirteen hours a day, they should be invalids of a robust type. The capital of the little republic evidently impressed him favourably. Throughout his journey the author took every opportunity of studying the character of the Boers. To most Englishmen these people have seemed an embodiment of all that is cross-grained and impracticable, and there has been much excuse for the charge; but Mr. Trollope attributes their peculiarities less to any inherent qualities than to their long isolation from all civilising influences. Their independent and anti-social character inclines them besides to isolate themselves from their fellows on their large farms, and the natural defects of such a character must be aggravated by an existence of this kind. They are accused of indifference to education, but Mr. Trollope observes that they maintain resident or itinerant teachers, with relatively high salaries. He declares the Boer to be emphatically a gentleman, often wanting in refinement, but never intentionally discourteous. He has degenerated from the cleanliness of the mother-country, and his house and person compare unfavourably in this respect with those of the German or English immigrant. That he should be hated by the natives is natural; that he should be despised by the Englishman is perhaps intelligible, but hardly just. In the Transvaal, indeed, Mr. Trollope says he had become incapable of governing, and could not even fight; but his brethren in the Orange State show no such falling off.

We have not space to allude to various topics of interest handled by the author. He gives us his impressions of the diamond-fields; some facts about ostrich-farming, about the expense of living and of travelling; he also touches upon the resources and character of every province separately, in such a manner as to leave a distinct impression of the leading features of each. And notwithstanding that, as he expressly tells us, the journey was hastily performed, the information hurriedly collected, and the book hurriedly written, we may confidently say that the reader who does not acquire

from the book some much more definite notions about "South Africa" than he had before must be exceptionally well-informed on the subject. COURTIS TROTTER.

TWO PRUSSIAN KINGS.

Friedrich der Grosse. Friedrich Wilhelm der Vierte. Zwei Biographien von Leopold von Ranke. (Leipzig: Duncker & Humblot, 1878.)

(First Notice.)

CARLYLE, parodying what the Great Wizard of the North said of Cr billon *filz*, puts this remark into the mouth of languid indolence—"be mine to lie on this sofa, and read everlasting novels of Walter Scott." The intellectual voluptuary of a sterner sort might find his heaven in a perpetual flow of histories by Ranke, and the demand would scarcely exceed the supply. Besides a collection of papers supplementary to the fine work on Hardenberg, which removed from German literature the reproach of having no book on the Revolutionary Epoch and Wars of Liberation worthy of the dignity of the subject, Ranke has recently published various volumes of the collected edition of his works, some of them largely expanded and improved, and two Lives of Friedrich the Great and Friedrich Wilhelm IV. (the brother and predecessor of the Emperor William), reprinted from the German Biography now appearing at Leipzig.

Such faculty of work at such an age, and such unimpaired plenitude of the intellectual powers, recall the vigorous longevity of Humboldt or Titian. Like *Cosmos* and the *Shame of Calisto*, Ranke's newest productions show no sign of an octogenarian hand. "Both for minute researches and for large speculations"—to take the phrase applied to him by Macaulay nearly forty years ago—he is still as fit as ever. Alone of the modern Germans who have written on the national history, he is at once scholar, politician, and artist. His selective, skipping method, his exclusion of description and anecdote, his neglect of individual characteristics and details, have here some excuse in the limits of space imposed. But a mere fragmentary Friedrich, evaporated to a royal, military, diplomatic abstraction, is not Friedrich at all. A great man's personality is an important piece of himself, which affords quite as interesting and instructive a study as the ideas which he represents and the transactions which he sustains. However, Ranke has lately avowed that this is not his opinion. "The general movement," he has said, "is the actual life of history: real significance has the statesman none, except in so far as in his place he assists—perhaps leads—it." Writing in this spirit (which must not be confounded with Buckle's belief that the men falsely called great have no action on events, but are merely dragged about in their train), it follows that public policy is the point of sight to which all the lines of his historical perspective run; the foreground being as full as possible of the relations of emperors, kings, and ambassadors, special room being allowed for the diplomatic function, for which Ranke has unusual veneration.

The capital political event in the life of Friedrich the Great was his seizure, seven months after his accession to the throne, of the Austrian province of Silesia, a proceeding which Prussians and Englishmen are never likely to call by the same name. On the last part of this affair Ranke is plain enough. His narrative does not conceal the truth that, whatever Prussia's wrongs may have been, Friedrich's invasion of Silesia was no vulgar instance of ordinary civilised aggression, but a proceeding of the highest diplomatic finish, which no *condottiere* of the Renaissance ever surpassed. One must not be more Royalist than the King, and in this instance Ranke is much more Friedrichian than Friedrich, who in his Memoirs candidly avows with the coolness of a Braccio or a Carmagnola that "claims" had little to do with his decision to attack Maria Teresa, the real incentive being his desire to try his army and make a name. Stated in general terms, as they are, for instance, by Ranke, these "claims" may have an air of reality. The notion is suggested of a case like that of Austria a hundred years ago aspiring to get back the old *avulsa imperii* from France, or of France now thinking of Elsass and Lothringen, Italy of Savoy, or Russia of the Bessarabian territory lost in 1856. Closely examined, the "claims" turn out to be mere shadows. The Silesian dominions in debate had never been in the possession of any Hohenzollern elector or king. The principality of J gerndorff was held at the time of the Reformation by a member of the collateral Anspach-Baireuth line, and descended in that side-branch till the Thirty Years' War, when the Prince, taking part in the rebellion of the Elector Palatine, was dispossessed of his territory after the battle of the White Mountain. His son having no heirs of his body, the family claims on the forfeited principality devolved on the reigning electoral house. The case of the three duchies was weaker still. A treaty signed in 1537 between the ducal owners and the Hohenzollerns prescribed that on the failure of the reigning Silesian lines the duchies should revert to Brandenburg. The dukes died out in 1675, when the emperor refused to permit the elector to take the lands, declaring them to be fiefs of the Bohemian crown. All this was a standing grievance with Brandenburg, and the emperor thought it best to quiet the Grand Elector with the circle of Schwiebus, of which, however, Brandenburg was afterwards deprived in a very tricky fashion. As opportunity offered, Prussia from time to time raked up her supposed rights, which she considered to remain in force, reserving them, in particular, by a fresh reminder during the negotiations for the acknowledgment of the Pragmatic Sanction. Friedrich's Memoirs show how little importance he attached to his claims, which, in the opinion of his Minister for Foreign Affairs, would not hold water. This was the report of Podewils to his master:—

"Pour la question du droit il faut que je dise que quelques pr tensions bien fond es que la maison de Brandenburg ait eues autrefois sur les duch s . . . il y a des trait s solennels que la maison d'Autriche reclamera et par lesquels la maison de Brandenburg s'est laiss e induire, quoique fraudu-

leusement, à renoncer pour des bagatelles à des prétensions si considérables."

On two other transactions of this date want of space has prevented Ranke from being perfectly candid. The few words, "the king was welcomed on his arrival in Breslau," hide the fact that the capital of Silesia, which was a kind of free city, was seized in breach of a convention specially made between the magistracy and Friedrich, who acted in this affair as if eager to rival the occupation of Strassburg by Louis XIV. Then the famous Convention of Klein-Schnellendorff is slightly whitewashed, so as to mask the fact that Friedrich, as Carlyle says, was throwing "loaded dice," and, indeed, treating Austria much as Clive treated the banker Omichund in the matter of the Red Treaty. The invasion of Saxony, which began the Seven Years' War, Ranke is entitled to call a defensive move: Russia, France, Austria, Saxony, and Poland were, no doubt, preparing to cut down or destroy Prussia, though their plans were less advanced than Friedrich supposed. Ranke's sketch of the war is slight: the battle of Hochkirchen has tumbled out altogether. But his account of Friedrich's relations with the Empress Catharine is excellent, and worth study by statesmen, for Friedrich's policy towards Russia in the second half of his reign is Germany's policy now. In the Silesian wars the Empress Anne had been his passive friend; the next Russian sovereign, the Empress Elizabeth, was his bitterest enemy, and but for her death in 1762 the Seven Years' War would probably have ended with the ruin of Prussia. The sentiments of her successor, Peter III., were those of Anne, and the apprehension that the armies which had defeated Friedrich at Kunersdorff would now be found fighting on his side brought Maria Teresa to renounce her attempts to reconquer Silesia. Peter's marriage with the great Catharine had been in part Friedrich's work, and after she had deposed and murdered her husband, she stuck to his policy on private and public grounds. Animosity toward England, and his sense that Prussia must acquire a trustworthy ally, converted a personal into a political bond. The logical consequence was his toleration of Catharine's destructive policy in Poland, of the election of Stanislaus Poniatowski, and her patronage of the Dissidents, the Bulgarians of the Polish question. He was personally averse from her schemes of Turkish conquest, first actively indicated by her plot against Wallachia and Moldavia, of which Austria, backed by France, positively forbade the execution, while England encouraged Russia's pretensions, so that—astonishing to read in 1878—the alarm prevailed that "Russia would thus obtain the mastery of the Black Sea, and the combined naval power of Russia and England domineer over the Continent from coast to coast." Pledged to Russia, and leaning on the whole that way, Friedrich took alarm at the Polish troubles, into which he feared he would be dragged as a combatant, especially as the antagonisms of Austria and Russia extended to the republic. The partition of that country had been in the air for about a century, and it is possible that Friedrich was a little more

active than the Imperial Court in now bringing an old idea into working shape. But he was perhaps moved almost less by the desire for Prussian aggrandisement than by the hope that Russia, preferring the realities of spoliation in Poland to the chances of it on the Danube, would drop her prey. The plan succeeded, and Friedrich continued to stand to his alliance with Russia, which served him as a tower of strength for the remainder of his reign. G. STRACHEY.

Women of Fashion. By W. H. Davenport Adams. In Two Volumes. (London: Tinsley Brothers, 1878.)

THESE two volumes contain biographical sketches of Lady Wortley Montagu, the Duchess of Marlborough, Lady Morgan, Miss Berry, Madame D'Arblay, Mrs. Inchbald, the Countess of Blessington, Charlotte Brontë, and Miss Martineau. So much of a popular kind has been written about all these ladies that it is difficult to say anything new that is also worth saying. Mr. Davenport Adams attempts no novelties. His narrative runs placidly in the old channels; the anecdotes are familiar, and his estimate of each lady's character in succession is invariably the popular one. It is rather a comfort to read about our old friends and not to be told that we must henceforward entertain quite a new opinion of them. Mr. Davenport Adams leaves the white-washing and black-washing for others to do. In his good-nature he follows by preference the white-washers, but where the black brush has been liberally applied he notes its work as gently as possible. The ladies have in him a courteous if not a very spirited champion. In two instances only he has ventured to go a little out of the ordinary beat of criticism. He is more disposed than most people in general, and Leigh Hunt in particular, to forgive Lady Mary when she laughed at Pope for making love to her, and very gallantly scouts the doctrine that it was her duty to pity a man, even if he were a poet, in the circumstances. Then, again, he has an almost extraordinary admiration for the Duchess of Marlborough, forgives her hot temper, avarice, and other faults, and believes, what is probably the truth, that in a woman who could make both men and women love her and endure her as she did, there must have been an element of greatness as well as honesty.

We are indebted to Mr. Davenport Adams for a large array of quotations from the writings and letters of his heroines. It is by this means that we can best judge of the women for ourselves, and unless we have their fuller memoirs and collections by us every characteristic quotation is sure to find a welcome. The passionate self-vindication of the splendid duchess is hot on the paper as we read selected specimens from her autobiography, written in her angry old age. The spiteful humour of quiet little Burney astonishes us almost as much as it did her contemporaries, and her egotism a great deal more so. The most interesting quotations are of course from Lady Mary's all-fascinating letters, which, even if we know them by heart, are as sweet in repetition as an old ballad. And some of them,

having reference to the education of women, have at this date a new and special significance. We find here a passage from her famous letter to Bishop Burnet, written when she was nineteen, in which she pleaded with a touching earnestness for what we should call in these days the "higher education of women." But we are not quite so confident as our author that she would have stopped short of modern innovations. She was at heart a woman and an innovator. She risked her own child's life to prove a point in medical knowledge, and proved it. Then she had in her from her girlhood onward the spirit of a champion. And when she was old she was still ready to "fight her battles o'er again." In one of her latest letters to her daughter she thus wittily attacks a popular theory:—

"The same characters" [she is talking about princes and women of quality] "are formed by the same lessons; which inclines me to think, if I dare say it, that nature has not placed us in an inferior rank to man, no more than the females of other animals, where we see no distinction of capacity, though I am persuaded, if there was a commonwealth of rational horses, as Dr. Swift has supposed, it would be an established maxim among them that a mare could not be taught to pace."

We do not understand Mr. Davenport Adams's system of chronology, or why he places Lady Mary before the Duchess of Marlborough, who was thirty years her senior. Nor do we like the title of his book, which has more sound in it than truth. "Queens of Society," "British Women," and other names better and worse have been used up for a variety of similar collections; but surely a better title might have been found for one in which a Brontë and a Martineau are conspicuous. Indeed, the designation is scarcely a compliment to any woman whose biography is worth writing or reading. Lady Blessington is perhaps the only one in the series who would have been proud of it, and even she, with her boudoir coterie and trashy *Books of Beauty*, may rank more fitly among her own "Victims of Fashion" than its leaders. Should not a really "representative" group of women, representing English society and English letters from Lady Mary's time to the close of the eighteenth century, include a far longer and therefore more brilliant and suggestive series than Mr. Davenport Adams's somewhat incongruous nine?

ROSALINE ORME MASSON.

CURRENT LITERATURE.

A Short History of Penzance, St. Michael's Mount, St. Ives, and the Land's End District. By the Rev. W. S. Lach-Szyrma. (Truro: Lake and Lake.) From the beginning to the end of this volume the reader will scarcely meet with a trace of independent research on the part of its author. The materials for correcting or supplementing the assertions of the previous histories of West Penwith are within easy reach, but Mr. Lach-Szyrma makes no attempt to use them, and is content to reproduce without addition or correction the statements of his predecessors. He almost seems to possess a genius for blundering in quoting proper names, as the meagre list of authorities prefixed to his volume contains nine errors. Such a terrible specimen of inaccuracy almost induces a feeling of thankfulness that he has abstained from meddling with original documents. Mr. Lach-Szyrma has acted wisely in

inserting in his book a facsimile of the map of "Penwith hundred" drawn up by Norden nearly three centuries ago. That industrious topographer marked on it all the chief country houses in the district, and supplied the names of their owners. A glance at this old map brings before the ignorant the names of the principal country gentlemen at the date of Norden's survey, and shows the changes which have taken place in the ownership of the soil. Judging from the numerous grammatical errors which disfigure the volume it has passed through the press with insufficient supervision. If Mr. Lach-Szyrma wishes to be remembered as an historian of the West country, he must rise far higher than he has done in this disappointing book. It adds nothing to the history of the West Penwith.

Spenser for Children. By M. H. Towry. With illustrations in colours by Walter J. Morgan. (Chatto and Windus.) This volume proves satisfactorily that Spenser may be made accessible to children, and, we think it will be found, become a favourite with them. *Experto crede!* The small auditors on whom we have made our trial showed an unflagging interest in the adventures of St. George and his fellows. "The Well of Life," "The Bower of Bliss," "The Gulf of Greediness," have become household words; and we have realised with enthusiastic accuracy all that pomp that marched forth from the House of Pride, Idleness on his ass, Gluttony and his pig, down to No. 5 (one of the Spenserian train Mrs. Towry omits), "fierce Wrath on a lion that would hardly be restrained carrying in his hand a burning brand which he brandished about his head." Commend us to such an audience and such a volume! Mrs. Towry has done her part well, though it might easily, we think, be done better. Still we will not complain, as it might have been done so infinitely worse. Why does she call Guyon Guy? Why does she use the unsightly form *Pyrrhoclus*? With regard to the latter form she might perhaps to a certain extent defend herself by pleading that she finds *Pyrrhoclus* in the 1590 and '96 editions; but had she happened to glance at the "faults escaped"—what we call "Errata"—she would have found it corrected. Of course the name is derived from the Greek *πύρ*, and the second *r* is a mere intrusion. There are several "faults escaped" in her own volume—some escaped from the editor as well as some from the printer. On p. 147 "stumbled" should be "tumbled." On the same page, what is meant by "hurdled down showers of stones?" "Hurdled!" Spenser uses quite enough queer forms without any fresh ones being fathered on him. With regard to grammar as well as other matters, "maxima debetur pueris reverentia." What shall we say then of such a phrase as "here be another perilous passage"? We hope Mrs. Towry is not one of those singular people who fondly believe that Old English is simply another term for bad grammar—that the real trick of it consists in occasional violations of all the concords—all that are violable in English; and that to give her work an archaic touch she is bound now and then to insult the mighty shade of one Lindley Murray. We see on another page she writes:—"The gate was of precious ivory, and on it was carved the histories of Jason and Medea." The illustrations may, on the whole, serve their purpose; but to some of them much praise cannot be given. It is impossible to allow Sir Guyon any credit for resisting the fascinations of the Mermaid's Island, if it was at all what Mr. W. J. Morgan represents it. We should think that "fair son of gentle Faery" an idiot if he acted otherwise.

La Revue de Droit International et de Législation Comparée. The Report of the third session of the Institut de Droit International, which was held at Zürich under the presidency of Prof. Bluntschli, of Heidelberg, in the month of September, 1877, has recently been published in the

third part of the ninth volume of this Review. The Report contains an interesting account of an ancient patriotic Guild or fraternity established in Zürich as early as the middle of the fifteenth century, which bore the name of "the Bucks" (die Böcke), and met at the sign of "the Snail" (zum Schnecken). Many interesting historical traditions connected with the frequent wars which Zürich had to sustain in defence of its liberties attach to this ancient guild, which was composed of the most valiant warriors of the place, and its name has been preserved in a modern club at Zürich, as the name of "Les Gueux," so famous in the history of the revolt of the Low Countries against the despotism of Spain, has been inherited by a club at Brussels. The members of the Institute were entertained by the Municipal Council of Zürich in the hall of the modern edifice known as "the Snail," the elegant club-house, in fact, of "the Bucks," in whose commodious suite of apartments the sittings of the committees were held. Among the subjects discussed by the committees were "The Conflict of Law between different States in their forms of Civil and Criminal Procedure;" "The Modification of the Belligerent right of Capture as regards Private Property in the High Seas in time of War;" "An Improved Organisation of the Tribunals of Maritime Prize;" "The Applicability to Asiatic Nations of the Customary Public Law of Europe;" and "The International Arrangement of Railway Traffic after a project approved by the Federal Government of Switzerland." New committees were appointed to report at the next session of the Institute, which is to be held in Paris in the month of September of the present year, on the International Protection of Artistic Copyright; on the Neutralisation of the Suez Canal; and on an International Concert on the subject of Maritime Prize and Maritime Prize-Courts. The Review further contains the second and concluding parts of a carefully-prepared enquiry by Prof. A. Rivier, of the University of Brussels, into the diversities which exist in the laws of the various cantons of Switzerland on the subject of succession to the property of deceased persons in cases of either testacy or intestacy. Dr. Bulmerincq, formerly Professor of Law at the University of Dorpat, has contributed an interesting paper on the conflict between "la politique" and "le droit" in the life of states. The poverty of the English tongue does not allow us to render effectively into English the ideas represented in this paper by the terms "politique" and "droit" respectively, further than that the former are conditional or relative; the latter non-conditional or absolute. The practical object of the Professor is clearly set forth by him towards the conclusion of the paper—namely, to induce the English nation to renounce her "politique" as regards her practice of capturing on the high seas the private property of enemies, as being contrary to right (*contre le droit*). Dr. Hovy, of Amsterdam, has supplied some useful observations on the necessity of a code of international regulations regarding the transport of goods by railway. Dr. Krauel, consul of the German Empire in the port of Shanghai, has furnished some very valuable information touching the probability of the Asiatic nations conforming themselves to the public law of Europe, which he holds to be out of the question in the instance of the Chinese nation. A review of the proceedings of the Association for the Reform and Codification of the Law of Nations, at its fifth session held in the Hôtel de Ville of Antwerp in August, 1877, is next in succession, followed by an account of the International Artistic Congress in the same city, and by the proceedings of the International Congress at Lausanne on the subject of the ravages of the *Phylloxera* in the wine districts. M. Léon de Montluc supplies an account of the proceedings consequent on the arbitration between the United States of America and the United States of Mexico, in which, after the award made by the

arbitrator, Sir Edward Thornton, Her Majesty's Minister at Washington, it was ascertained that false evidence had been laid before the arbitrator by one of the parties. The bibliography is entirely from the pen of M. G. Rolin-Jaequemyns, the secretary-general of the Institute of International Law, who has supplied a very full account of all the most important Spanish works of recent origin on political and juridical subjects, as well as a notice of several valuable French and German publications.

My Brother Jack: or, the Story of What-d'ye-call-em, written by Himself. From the French of A. Daudet. Translated by L. Ford. Illustrated by P. Philippoteaux. (Sampson Low.) M. Daudet occupies at the present time a leading position among popular novelists in his own country; and the extensive circulation of this book in France affords full justification for its early translation into English. Its title is somewhat ungrammatical. "Brother Jack" is only the secondary hero; the autobiographer himself is called Daniel Eysette, and his nickname of "What-d'ye-call-em," though suggesting as a motto a quotation from *The Hunting of the Snark*, has but little significance. The interest of the story is twofold. In the early chapters the attention is arrested by the blank realism with which is depicted a not very attractive aspect of French society. The bitterness of poverty in the family of a bankrupt Provençal merchant, and the more acute agony suffered by an usher in a college—the counterpart of an English public school—are described with a graphic power that trusts to small details for its general effect rather than to elaborate analysis of character. This portion of the book occasionally recalls the corresponding chapters of *Jane Eyre*. Then the scene changes to Paris, and we suddenly learn the main motive of the story in the self-sacrifice of "Jack" for his brother. Fraternal piety, passing the love of woman, and stronger even than the passion of jealousy, finally leads to a situation rarely before attempted by masculine writers of fiction, but paralleled in Mrs. Browning's poem of "Bertha in the Lane." As a work of art, the story must be judged not by the coherence of its parts or the ingenuity of its plot, but by the literal fidelity with which it tells its own simple tale. From this point of view we must award to the author a high measure of praise; and the English reader is especially indebted to him for his vivid sketch of the commonplace externals and the heartfelt emotions that combine to make up French *bourgeois* life. Works of this order are so rare in our own literature that we heartily welcome the present translation, which reads smoothly enough, but still retains the freshness of the original. The illustrations are yet more French than the letterpress. They certainly assist in deepening the general impression of modern realism.

NOTES AND NEWS.

PROFESSOR JEBB is engaged upon an edition of the seven plays of Sophocles. This edition will be independent of his commentaries on the *Electra* and the *Ajax* in the *Catena Classicorum*. It will comprise critical notes on the text, a commentary, a translation into English prose, and illustrative essays. The work will be published for the Syndics of the Cambridge University Press.

PROF. STERN has discovered in the archives of Oldenburg a relation by Mylius of his visit to England, containing an account of his conversations with Milton, as well as some unpublished letters of Milton himself.

STUDENTS of our eighteenth-century literature will be glad to learn that Prof. J. E. B. Mayor, of Cambridge, is engaged on an edition of Boswell's *Life of Dr. Johnson*. Those who are acquainted with his contributions to our eighteenth-century biographical lore will probably be sanguine enough

to look for an edition which, as regards minute accuracy, wealth of literary illustration, and beauty of typography, will throw all previous editions of this great English classic into the shade.

SIGNOR ANGELO DE GUBERNATIS, Professor in the University of Florence, has been invited by the curators of the Taylor Institution to give a course of three lectures in Italian, on some period of Italian Literature. Similar lectures were delivered before the University of Oxford, by M. Taine in French, and Professor Klaus Groth in German. The writers selected for his lectures by Signor A. De Gubernatis will be Manzoni, Balbo, and Niccolini.

ACCORDING to a circular recently published in India, Dr. Leitner of Lahore intends to return to England, in order to open an institution for young Hindoos who are preparing for the Indian Civil Service Examinations. Care will be taken that residence in the institute shall not entail loss of caste. There will be Hindoo cooks, and even water from the Ganges. Similar arrangements will be made to meet the case of Mohammedan pupils. The institution is to be supported at first by subscriptions from native gentlemen and noblemen.

THE *Nautical Magazine* for April contains an article by Sir Travers Twiss on "Territorial Waters," and on the necessity of amended treaty-arrangements between the maritime powers on the subject of lighthouses and the navigation of steam vessels on the high seas.

THE late Mr. Nassau W. Senior's *Conversations* with M. Thiers, M. Guizot, and other distinguished persons, during the Second Empire, will be issued shortly by Messrs. Hurst and Blackett. The work will be edited by Mr. Senior's daughter, Mrs. Simpson.

MR. J. E. MUDDOCK'S novel, *A Wingless Angel*, which has gone through two editions, is to be issued shortly by Mr. Arthur H. Moxon, in his "Popular Novel" series. Mr. Muddock is also engaged upon a new novel entitled *Whips and Scorns*, the publication of which begins to-day in several English and Scotch newspapers.

DR. F. H. STRATMANN, the author of the *Old English Lexicon*, which is the friend and helper of all Early-English scholars and students, has received from the Prussian Government an honorarium of 600 marks, as a slight acknowledgment of the value of his services to philology and literature.

THE third of Mr. G. W. Foote's "Public Readings from the Best English Writers, principally Poets," at the Langham Hall, is to take place on the 16th inst.; it will include Drayton's *Battle of Agincourt*, Hood's *Haunted House*, two scenes from *Macbeth*, and other appropriate matter, with interspersed music by Mendelssohn, Weber, Chopin, and Raff, Herr Mez being the violinist. This is an intellectual and tasteful series of readings. At the last evening of the series, March 26, Mr. Foote was particularly effective in a poem which is eminently well fitted for public delivery, Mr. Browning's *Hervé Riel*. He is a skilled elocutionist, combining energy with right feeling; he knows what is good, and does justice to his authors, his audience, and himself.

MR. SAMUEL NEIL, of Edinburgh, who has just added to his edition of Shakespeare's Plays in Collins's Series the *Midsummer Night's Dream*, with a capital Introduction and Notes, &c., is now at work on *Henry V.*, which will be his next issue.

THE sale of "the very choice collection of books and miniatures, formed many years ago by J. T. Payne, Esq.," which Messrs. Sotheby announce for next Wednesday, will be a field-day for the *bibliophiles*. The lots are only 117 in number, and consist almost entirely of single volumes or single illuminations; but so important are they that the auctioneers have thought it

worth while to issue, at the price of five shillings, a catalogue with facsimile illustrations sumptuously printed in gold and colours. Mr. Payne, of the once-famous firm of Payne and Foss, is a *bibliophile d'élite*; a lover of books not only or not chiefly for their matter and their style, but for their condition, their rarity, and, above all, for their antecedents. Accordingly, his collection contains "specimens of the most famous libraries from the sixteenth century (in the original richly ornamented bindings), including those of Francis I. and Henry III. of France, Grolier, Demetrio Canevaria, De Thou, Count Hoym, Longepierre, Lamoignon, Renouard, Charles Nodier, etc.," uncut Elzevirs, early Aldines, books bound by Du Seuil, Angerran, Derome, Padeloup, and especially by Roger Payne, the greatest of English bookbinders, and (we suppose) of the family of the owner of these treasures. It is invidious to select where all are admirable; but we feel specially attracted by the Elzevirs, which possess the three qualities so much sought after by collectors, viz., height, rarity, and uncut edges. Here, for example, is M. Renouard's copy of the *Elzevir Caesar*, "probably, except perhaps that in the National Library at Paris, the finest copy known." Here is a Tacitus 145 millimètres high, whereas in a recent Paris sale a great noise was made about a copy that measured only 133. Here is the famous Delatour copy of *Pliny*, three small 12mo volumes, which in the course of their eventful career have been once sold for 1,500 fr. Here is the *Boccaccio* of 1665, "entirely uncut, and believed to be altogether unique in this state." We need not, however, dwell any longer on these priceless little volumes, nor would it serve any purpose to speculate on the sums they will command. We will conclude this note by pointing out the three miniatures of extraordinary beauty with which the sale will end. One of these, "by the famous miniaturer, Girolamo dei Libri," is believed to be the finest ever offered for sale in England.

THE Religious Tract Society announces for early publication a work on *The Progress of Divine Revelation, or The Unfolding Purpose of Scripture*, by the Rev. Dr. Stoughton. The same Society will speedily issue a new and much enlarged edition of an History of the English Bible, also by Dr. Stoughton, written several years since. This work will be illustrated with characteristic portraits, facsimiles, and views, and will contain a detailed account of the Biblical revision now in progress at Westminster.

THE Fifth Part of Dr. Richard Morris's four-text edition of the *Cursor Mundi* for the Early English Text Society will contain, beside the original addition to "The Seven Ages of the World,"—the Conception of Mary, &c., mentioned in the Prologue to the poem—seven other supplementary treatises, of which the longest is a "Book of Penance," with its three parts, of Contrition, Confession, Satisfaction, somewhat like Chaucer's *Parson's Tale*, while the most plainly imported one is the *Disticha or Morals of Cato*, a late fourteenth-century adaptation of Everard's French version, unluckily incomplete.

MESSRS. HURST AND BLACKETT have in the press *The Memoirs of Georgiana, Lady Chatterton*, by Mr. E. Heneage Dering. The work will comprise some passages from a diary kept by Lady Chatterton, and many letters from her celebrated contemporaries and friends.

MESSRS. LONGMANS announce *Industrial Chemistry*, based upon a translation of Stohmann and Engler's German edition of Payen's *Précis de Chimie*, edited by B. H. Paul, Ph.D.

THE Historical Society of Berlin has decided to issue annual reports concerning the literature of history, which are to emphasise and expound all the really new facts discovered. The series will commence with the literature of the current year, and will be published about Easter, 1879.

THE Roman journal, *Il Bersagliere*, has issued a selection of the best poems written on the king's death. Some of these are really excellent, and display more power and poetic faculty than is common to *vers d'occasion*.

THE eighth part of the Palaeographical Society's facsimiles, which is now ready for distribution, contains twenty-four plates, among which are the Greek inscription of the Rosetta Stone, and specimens from the three famous Greek codices of the Bible—the Vaticanus, the Sinaiticus, and the Alexandrinus; with others from the pictorial roll of the Book of Joshua in the Vatican, and from the ancient MSS. of Vergil in the same library. The rest of the plates represent an early Roman inscription, an Oscan inscription, a page from the Gothic Gospels of Ulphilas at Upsala, two early Merovingian charters, and several later MSS., ending with the English Cuckoo song of the thirteenth century.

MESSRS. STANFORD and Dr. Petermann both send us maps of Turkey in Europe and Armenia, in which it is clearly shown what diminutions of territory the Porte would suffer if the precise terms of the Treaty of San Stefano were carried out. Something of the kind is invaluable, as anyone can testify who has wasted his time by trying to understand the provisions of the Treaty from an ordinary map.

M. DE MOLINARI continues, in the last number of the *Journal des Economistes*, his series of essays on the "Economic Evolution of the Nineteenth Century." It is a splendid subject, and the more to be regretted that this distinguished writer should take so limited a view of the nature of the problems it opens up. The main principle of his present essay is that the tendency of civilisation is towards individual liberty and self-government, with two exceptions, namely—first, where in their own interest, as in the case of minors, a regimen of guardianship is expedient; and, secondly, where in the interest of others, as in the case of criminals, a regimen of compulsion or servitude is necessary. In what class are women to be placed? Among persons fit for self-government, among those requiring guardianship in their own interest, or among those who must be kept in restraint in the interest of others? that is to say, where women are concerned, in the interest of men. The advocates of equal rights for both sexes will not be content with M. de Molinari's cautious and evasive answer. Among the Anglo-Saxon and Slav nations the tendency, he says, is towards the full emancipation of women. Should that lead to a better order of things, it will be recognised, he adds, as a step in human progress; otherwise the sort of guardianship under which women hitherto have everywhere been placed will be re-established. The *Journal* also contains a very interesting article by M. A. de Fontpertuis, vigorously resisting the project for which a clerical party, supported by some mistaken philanthropists, contends, of re-establishing the old system of foundlings' hospitals, with the *tour*, a sort of revolving box for the reception of infants in the streets, and carrying them within the hospital, which Brougham called the finest little machine for demoralisation that had ever been invented. M. J. Clement, in another article, makes some valuable suggestions for the extinction of that mischievous relic of mediæval finance, the *ostroi* duty.

THE last number of the *Deutsche Rundschau* is exceptionally rich in first-rate articles. It begins with an unpublished poem by Goethe, written probably between 1820 and 1827, and originally intended for the *West-östliche Divan*. The MS. was given to Prof. A. Nicolovius, who presented it in 1838 to Prof. E. du Bois-Reymond. Du Bois-Reymond gave a copy of it to his former assistant, Dr. Boll, now Professor at Rome, who, it seems, without Du Bois-Reymond's sanction, allowed the Marchese Anselmo Guerrieri Gonzaga

to translate it, and to publish it, together with an Italian translation, in *La Fanfulla* (February 7, 1878). The poem has the true ring of the old master, and its genuineness does not seem to be doubted. There are two tales, one by Theodor Storm, another by Bret Harte. Bret Harte's story was written for the *Deutsche Rundschau*, and appears at the same time in English and German. But for the name of the writer, we doubt whether the contribution would have been accepted, while Storm's tale, "Renate," is a true work of art. Whether as a sketch of German life in the beginning of the last century, or as a picture of German love, in the best sense of the word, Storm has seldom produced anything more perfect in so small a compass. Gebler's article, "On the Track of Galilei," is written by a man who is completely master of his subject, and who bearded even the great Inquisitor, Monsignore Leone Vincenzo Sallus, in his very den, to get at the original documents of Galilei's condemnation. Hirschfeld's account of Modern Greece is short, instructive, and full of interest, particularly at the present moment. The same applies in a still higher degree to Prof. Geffken's article, "Katharine II., the Porte, and Europe." That article ought to be read not only by those who remember Prof. Geffken as formerly the accomplished Minister of the Hanseatic Towns in England, but by all who want to know the first threads of a diplomatic web spun by Russia in the last century, and supposed now to be near its completion. If the *Deutsche Rundschau* is able to maintain its present level, it will have reached its ambition of being not only the first journal in Germany, but a worthy rival of such cosmopolitan reviews as the *Revue des Deux-Mondes*, the *Contemporary Review*, and the *Revista Europea*.

THE *Nuova Antologia* for March 15 has a valuable article by Signor Ciampi on Luther's visit to Rome, in which he points out the absence of any records or traditions of it in Rome itself. He gives a description of the destroyed monastery of Santa Maria del Popolo, where Luther most probably stayed, and then gives an account of the chief political and social occurrences in Rome during Luther's residence. He examines Luther's account of his impressions, and shows their unhistorical character and exaggerations: he assigns them to polemical motives of a later date, and not to actual facts which thrust themselves upon his notice in Rome; he compares them with the impressions of Germany related by Italian writers of the same period, and dwells upon the national antipathy between the two races. Finally, he concludes that the importance attached by Luther's biographers to his visit to Rome is due to the desire for dramatic effect, and that the development of Luther's own ideas was very little influenced by it. There is also an article by Signor Trinelli on Shakspeare's Sonnets, which does little more than give a *résumé* of the present condition of the controversy: the only conclusions to which the writer tends are that the sonnets are biographical, and are not addressed to the same person.

THE *Archivio Storico* begins this year its fourth series, and puts on a new livery to commemorate the fact; no change in its programme is announced. The current number has a valuable paper by Signor Carutti on Umberto I., Count of Aosta, surnamed Biancamano, who flourished from 980 to 1050, and was the founder of the dynasty of Savoy. Signor Carutti gives much valuable information about the first kingdom of Burgundy and the complicated history of the tenth century. Signor Ciampi gives an interesting account of Sigismondo de' Conti, of Foligno, who was attached to the Roman Curia from the pontificate of Sixtus IV. to Julius II., and who left behind him a history of his own time which has never yet been published. Signor Ciampi is engaged in editing this very valuable work, and gives a few quotations which sufficiently show its importance.

IN the *Preussische Jahrbücher* for March is an article by Dr. Pauli on the relations between the Hansa and the Church, pointing out the serious piety of these mercantile communities. Herr Schöne publishes an eloquent address, delivered at Berlin, on the Teaching of Drawing in Elementary Schools. He points out that the training of the eye is an equally real method of cultivation with teaching to read, and notes the fact that children when they begin to read pay less attention to external objects, so that it is necessary to counterbalance the weakening of the natural power of susceptibility to outward impressions by a direct training of the power of observation by means of drawing.

THE death is announced of M. de Loménie, Professor of French Literature at the Collège de France, and a member of the French Academy.

MESSRS. KERBY AND ENDEAN will publish shortly a narrative of Life in the Trenches, by Col. Reynell Pack, C.B., Seventh Fusiliers. We hear that it will contain severe strictures on officers high in command during the Crimean War.

OBITUARY.

WE regret to announce the death of Mr. Mayers, late Her Majesty's Chinese Secretary of Legation, which occurred at Shanghai on Sunday week last. Mr. Mayers entered the China Consular Service as a student interpreter in 1859, and rose with unusual rapidity through the various grades until in 1871 he received the appointment which he held at the time of his death. In less than two years from the date of his first entering the service, he had acquired a sufficient knowledge of Chinese to enable him to fill efficiently the post of interpreter to the English and French Commissioners who were charged with the government of Canton during the occupation of that city by the allied forces, and so highly valued were the services he then rendered that on the evacuation of the city in 1861 he was at once appointed interpreter to the Canton Consulate, without being called upon to serve in the intermediate grades. Subsequently he acted for some time as Vice-Consul at Canton, and afterwards as Consul at Chefoo, from which place he was moved to Peking. The period of Mr. Mayers' service in China was more stormy than any which had preceded it, and in nearly all the most embarrassing and arduous difficulties of that trying time he was called upon to take an active part. For a time he was associated with "Chinese Gordon" in his campaign against the Taiping rebels; at Chefoo he was called upon to deal with an outbreak in the neighbourhood against foreigners; and in Peking, in addition to the ordinary work, which is unusually heavy, the vexed questions of audiences with the Emperor, and the murder of Mr. Margary in Yunnan, laid on his shoulders burdens which were difficult to be borne. Under the pressure of work his health had of late shown symptoms of failing, and he was on his way to this country to take a well-earned leave of absence, when he was seized with a fatal attack of typhus fever.

Great as were the official services rendered by Mr. Mayers, his reputation does not rest entirely on them. He studied Chinese in no perfunctory way, but with scholarly enthusiasm; and from time to time he gave us, by means of his pen, glimpses into the particular studies which occupied his attention in the few and short intervals which he was able to spare from his official duties. His best known works are his *Chinese Reader's Manual*, *The Anglo-Chinese Calendar Manual*, the *Guide* which he published with Mr. Denny on the Treaty Ports of China and Japan, and the collected edition of the *Foreign Treaties with China*. But besides these volumes he contributed largely to periodical literature. His contributions to *Notes and Queries on China and Japan*, the *China*

Mail, and the *China Review* are many of them of great value, and it was not difficult for those acquainted with his style of writing to trace his pen occasionally in the reviews and magazines of this country. While at Peking he made a study of the Korean language, and had prepared a grammar of that little-known tongue which we hope may yet be published. The desire lately expressed by the trustees of the British Museum to acquire a copy of the *Imperial Compendium of Chinese Literature* was warmly taken up by Mr. Mayers, and it was entirely due to his exertions that, after negotiations which extended over a year, a copy of this rare and valuable work was secured for the national library.

THE German papers report the death of Ernst Keil, the editor and publisher of the *Gartenlaube*, who was born in 1817 at Langensalza. He was introduced to the book-trade in Weimar while a boy, and was stirred up to literary work by the sight of the great men who were then living there. He managed a series of publications in Leipzig, among others the once famous *Leuchthurm*, which Varnhagen von Ense has characterised as "eine imponirende Geschichtsquelle der Bewegungszeit." In 1851 this "light-tower" was precipitated to the ground in consequence of the prosecutions of the Prussian and Saxon authorities. Keil next published the *Illustrirte Dorfbarbiere*, which was edited by F. Stolbe, for which he had to pay the penalty of nine months' imprisonment. He soon afterwards founded the *Gartenlaube*, which he edited from its commencement until the day of his death. The serial was much prosecuted and often suppressed in its earlier struggles for existence; but Keil gradually reconciled himself to the conditions of his time and nation, and succeeded in raising it to an issue of nearly 400,000 copies. It has largely assisted in the extension of popular culture and in the awakening of a common German national feeling.

ON March 5, Andreas Willmann, who some years ago published a number of Studies on the dialects and folk-life of Switzerland, died in the Mount Sinai Hospital in New York.

THE death is announced of M. Ildefonse Rousset, editor of the *National*. He was the brother of M. Camille Rousset, of the French Academy.

WE are sorry to record the death on Sunday week of Riak Allah Hassoun Effendi, of Aleppo, one of the greatest living Arabic scholars and poets of the day. He was Turkish and Arabic interpreter to Fuad Pasha on the expedition sent to Syria by the Porte at the time of the massacre. He was a naturalised English subject, and the author of several excellent works in Arabic, both in prose and verse.

NOTES OF TRAVEL.

WE gather from the *Colonies* that at the close of last year Messrs. Eddington and Flint made an expedition to the Roraima range of mountains which lies between Guiana and New Granada. After an arduous journey they reached the base of the cliffs, at a height of 7,000 feet above the sea, and found further progress impossible. At this point the summit of the plateau, 2,000 feet higher up, could not be seen, as the cliffs overhang, and to travel round in search of a more accessible spot was next to impracticable, owing to the dense bush and the enormous difficulty of cutting a path through it. The travellers remained there two days, and witnessed a curious sight, viz., water falling from the summit, not in a continuous stream, but at intervals in immense waves. It is conjectured that the water must have come from a large lake on the summit, possibly the crater of some extinct volcano filled by rain, over which a gale was blowing from the opposite side of the mountain. Very little, it may be added, is known about this part of the country, or its inhabitants; and, indeed, the whole region round the head-

waters of the upper tributaries of the Amazon offers a vast, and hitherto neglected, field for exploration.

IN the course of his recent journey from Lake Nyassa, *via* Ugogo, to Zanzibar, Mr. H. B. Cotterill was able to verify the conjecture which has been put forward by Sir Joseph Hooker, that a temperate climate would be found to exist on the elevated plateaux of Equatorial Africa. In the Kondi country, which has never before been explored by Europeans, Mr. Cotterill and his party found themselves at an elevation of 6,000 feet above the sea-level, and there, to quote his own words, "the cool mountain air was most refreshing; the grassy slopes, rushing streams, the herds of cattle with their tinkling bells, the wild flowers—forget-me-nots, buttercups, heaths, and many old familiar friends—made it like a dream of Switzerland."

IN his *Heroes of South African Discovery*, a companion volume to that on North African discovery, which we noticed a short time ago, Mr. N. D'Anvers relates very pleasantly the deeply interesting story of the exploration of South Africa, from the time of the discovery of the Cape of Good Hope by Bartholomew Diaz, onward to the present day. As in the former case, the book is fully illustrated with woodcuts and maps. For the former there is not much to be said; indeed, the portraits of Livingstone and Stanley which are here presented are not much more like the originals than the praying mantis figured at page 74 is to the locust for which it does duty.

WE have received from the publisher, Herr Weigel, of Leipzig, a well-illustrated little work, by Ernst v. Hesse-Wartegg, entitled *Prairie-Fahrten; Reise-Skizzen aus den Nordamerikanischen Prairien*, full of graphic and amusing descriptions of life and scenery on the great plains of the Western United States.

MAGAZINES AND REVIEWS.

THE *Fortnightly* opens with an article which, by the time these words are in print, will have been widely read and much talked of; an article which stands almost alone among those that have ever appeared in that review in being unsigned. Although the writer, in this first paper at least, bases his ingenious view of Lord Beaconsfield's character mainly on the novels of Mr. Disraeli, the tempting subject is too near to party politics to be dwelt on by us. We are obliged to turn to the other papers of the number, and notably to the very interesting pages ("Memorials of a Man of Letters") in which the editor reviews the privately-printed memoirs and correspondence of Mr. Macvey Napier, well known to all literary men of the older generation and to all readers of Macaulay's Life as the editor of the *Edinburgh* after Jeffrey's day. The article contains little about Napier, and will be read rather for the extracts it gives from the letters of Napier's correspondents, and still more for the statement of Mr. Morley's own experiences and views of the present and the future of review-writing. Under the former head, let anyone who wishes to see what a great man will say under the stings of wounded vanity, turn to Lord Brougham's letters about Lord Melbourne and the Whigs; or any one who wishes to be convinced of the continuity of the theological rancour, turn to Professor Sedgwick's outburst against a once-famous book, *The Vestiges of Creation*:—

"I now know the *Vestiges* well, and I detest the book for its shallowness, for the intense vulgarity of its philosophy, for its gross, unblushing materialism, for its silly credulity in catering out of every fool's dish, for its utter ignorance of what is meant by induction, for its gross (and, I dare to say, filthy) views of physiology—most ignorant and most false—and for its shameful shuffling of the facts of geology so as to make them play a rogue's game. . . . From the bottom of my soul I loathe and detest the *Vestiges*.

'Tis a rank pill of asafoetida and arsenic, covered with gold leaf. I do, therefore, trust that your contributor has stamped with an iron heel on the head of the filthy abortion, and put an end to its crawlings."

That is pretty good for a Cambridge professor, not fifty years ago; and Sedgwick on the *Vestiges* may compare very well with Castiglione on Alfonso de Valdes, with Luther on Erasmus, with the Synagogue on Spinoza, with Milton on the prelatists. The change that has lately passed over the spirit of theological controversy Mr. Morley is probably right in attributing mainly to the practice of signing articles, which is one of the most notable facts in the recent literary history of England.

"The removal of the mask," he says, "has led to an outburst of plain speaking on these subjects, which to Mr. Napier's generation would have seemed simply incredible. The frank avowal of unpopular beliefs and non-beliefs has raised the whole level of the discussion, and perhaps has been even more advantageous to the orthodox in teaching them more humility, than to the heterodox in teaching them more courage and honesty."

This one advantage, he thinks, outweighs all the disadvantages, which however he is not at all inclined to undervalue. No one while exposing "the monstrous charlatanism of the old editorial We," has been more alive to the different kind of charlatanism into which a writer who signs his name is sometimes led, viz. that "he should say what he knows he is expected from his position or character to say." No one, again, has put more truly the effect which signed writing may have on the public:—"They are in some cases tempted away from serious discussion of the matter into frivolous curiosity and gossip about the man." And, as Mr. Morley reminds us, anonymity is only a veil in the case of people who are by nature undistinguishable. "If a writer in a periodical interests people, they are sure to find out who he is. The writer on Goethe in the last number of the *Quarterly Review* is as well known as the writer on Equality in the last number of the *Fortnightly Review*." We ourselves, it may be remembered, had no hesitation in naming the author of that most transparent article on Goethe when we recorded it in these columns. In the same number there are also several other articles on which, if space permitted, we should like to dwell; the first half of a temperate study of Mazzini, by Mr. Frederic Myers; another of Mr. A. O. Lyall's Indian papers, so interesting to the student of the comparative history of religions; Mr. William Jack's bold defence of the Manchester University Scheme; and Mr. Saintsbury's article on Gustave Flaubert, a fresh chapter of his appreciative and (it may be said) learned series on modern French novelists. Mr. Saintsbury knows the modern French novel as very few of us know the modern English one, and is as much at home in the writings of romanticists and realists as the best read among us is in those of Thackeray and Dickens.

THE *Contemporary* contains another of Mr. Gladstone's astonishing excursions into the region of comparative mythology, which show to what unhappy lengths a man of genius may go when under the dominion of an *idée fixe*. It will be enough to quote one sentence:—

"Thus there arises in the particular case a presumption, and I think it not too much to say a strong presumption, that the beautiful and benevolent Iris of Homer can trace her descent from the ninth chapter of *Genesis*."

Another article, which the editor thinks important enough to advertise separately, is Mr. Mallock's "Positivism in an Island: the new Paul and Virginia." *The New Republic* made its way by a union of clever and long-meditated epigram with exact portraiture of persons whom the author had studied at close quarters. In this instance the place of epigram and portraiture is taken by vulgarity and caricature. "Let us at least be glad," says Mr. Morley in the article which we have analysed above, "that orthodoxy, whether

scientific or religious, has mended its temper." Mr. Morley wrote that sentence before reading "Positivism in an Island." Mr. Freeman's continued attack on Mr. Froude in the pages of the same Review is growing tiresome. His sketch of the part played by Becket in the early constitutional reforms of Henry II. is an excellent specimen of what historical insight can accomplish to resuscitate the past. But Mr. Freeman should really not allow himself to stab the wounded at this rate after the fashion of his friends the Turks. It was worth showing, even after Mr. Lecky, that Mr. Froude cannot be trusted to reproduce the statements of his authorities. It is sheer barbarity to slay the slain over and over again. Everybody worth convincing is already convinced, and the only result of a continuance of the present style of controversy is that many will refuse to read Mr. Freeman's articles at all, and will so miss a great deal of information for which they would be much the better.

CANON BARRY's paper on "The Good and Evil of Examinations," in the *Nineteenth Century*, is a useful contribution to the examination question from one whose work in life has qualified him to give an opinion. It is at once a plea for the *juste milieu* theoretically, and an enquiry into the practical working of the present examination systems, coupled with certain suggestions of reform, which, however, do not come to very much. In the first place, Canon Barry maintains, in opposition to those who decry the whole principle of examination, that it is "possible by examination, deliberately and carefully conducted, to test and to estimate in those who are submitted to it, not only formed knowledge on this or that subject, but intelligence, thoughtfulness, and promise of future growth;" and in the second, that the idea of examination can be altogether dissociated from the idea of competition, and ought to be dissociated as much as possible. Starting from these general principles, the writer proceeds to describe the three functions of examination, "first as an instrument of education; next as a public test of excellence; and thirdly, as a means of selection either for rewards and privileges, or for appointment, and possibly for promotion, in the public service." The first two of these functions, as might be expected from the ex-headmaster of two important schools, are on the whole fully and satisfactorily discussed, though we notice an omission or two, besides an occasional blunder in fact. Why is so little said of the new Oxford and Cambridge schools examination system—an experiment which is likely to test the whole principle of examination as an educational instrument more thoroughly than it has yet been tested? And why does Canon Barry speak of the examination to be passed before a call to the bar can be obtained as if it were still an optional matter? King's College is near enough to the Temple to have led us to expect accuracy of statement on this point. Again, when treating the third division of his subject, Canon Barry "has heard" that "the standard of a first class has sometimes varied at Oxford, in order to distinguish a few cases of individual brilliancy (claiming a class to themselves), or to conceal the barrenness of this or that year. This, if true, would be intolerably unjust." The injustice of such a variation of standard is exactly what is always present to the minds of examiners, and their scrupulous care on this point is notorious. We are almost inclined to suspect that Canon Barry makes the remark on the authority of some second class man anxious to explain his own failure. With regard to Dr. Barry's suggestion that scholarships should be made probationary, we may remark that they are to a certain extent probationary already, although colleges might well be more ready than they are to act on that principle. It is by no means uncommon for a scholar who fails scandalously in an examination to lose either a part or the whole of his scholarship. In conclusion, it might be said that the paper does not answer the more delicate question of the effect of

the examination system on the finer minds among the students, nor on the position and influence of the Professoriate. It is interesting to notice that Dr. Barry, although an ex-headmaster, inclines towards a system of certificated teachers for all schools; and that he thinks it possible to go too far in the direction of doing away with local endowments.

SELECTED BOOKS.

General Literature.

CORRESPONDENCE.

"THE ECONOMY OF CONSUMPTION."

29 Stanley Street, S.W. : March 30, 1878.

I have no wish to discuss Mr. Leslie's criticism of my book on its merits in your columns, but Mr. Leslie makes one or two remarks to which I think I am justified in asking you to allow me to reply.

I refer particularly to his classing me with certain people who, he says, have attacked Mr. Mill since he was dead, on the principle "that a living dog is better than a dead lion." It is no fault of mine that my book was not published during Mr. Mill's lifetime, and had it been, it would have contained much severer things about Mr. Mill than it does; but I had also to remember that if Mr. Mill is dead his principles are alive, and that he has many followers and possesses much influence. Mr. Leslie has in fact refuted himself, as far as I am concerned, by quoting a much stronger thing about the "living lion," Mr. Fawcett, than anything I have said about the dead one, Mr. Mill. I deny, however, that I have treated either Mr. Mill or Mr. Fawcett disrespectfully, and I hardly think it is fair to quote such an expression of opinion as Mr. Leslie has given from me without the slightest indication of its grounds. I have no doubt whatever that Mr. Fawcett is a man of great ability, but I have equally little doubt that he is a political partisan, and I believe that he, as well as Mr. Mill, is incapacitated for dealing with political economy by the partiality of his sympathies. As I endeavour at great length to prove this, I cannot see that there is anything disrespectful in saying it. It is my sincere opinion, though I do not ask Mr. Leslie to take it on my word.

Mr. Leslie says I should have studied Mill's economy as a whole instead of picking out sentences here and there for attack, an insinuation which I may say is entirely without foundation. I suppose Mr. Leslie thinks this mode of criticism ought to be reserved for writers who have not yet made a reputation. If Mr. Leslie had read or remembered what I say on population instead of taking my views from a half sentence, omitting a

material reservation, he would have seen that I do not say that a time policy alone will prevent overpopulation; and if he had read a little more carefully what I say at various places about certain historical views of political economy, and about what I call the orthodox school of economists, he would have seen that the only way in which I "confound" them is in accusing them both of superficiality.

In another quotation Mr. Leslie materially misrepresents my view. He says truly that I affirm that the adoption of a time policy will at once and finally abolish strikes; but he quotes a sentence from my exposition of the method in which this will be brought about, in which I say that if the demand of labourers to determine the hours of labour is resisted, it will lead not to a strike but a lock-out, and, he adds, surely it comes to the same thing in the end. Now, what I do say is, that both the strike and the lock-out will be abolished by a time policy, the order of abolition being first the strike and then the lock-out. The very next sentence to that which Mr. Leslie quotes runs, "By whatever name, however, the forced suspension of labour is called, such a result can never ensue from the ordinary adjustment of differences under a time policy;" and the object of the whole chapter is to show that a lock-out can only arise from resistance on the part of employers to the principle of the policy, and that this resistance is certain to be defeated. ROBERT S. MOFFAT.

PROF. MAX MÜLLER ON HOMER.

1 Marlow Road, Kensington, W. :
April 2, 1878.

In Mr. Max Müller's essay, "Ancient Times and Ancient Men," in *Macmillan's Magazine* for April, several interesting points are raised. Mr. Max Müller, by way of a *reductio ad absurdum* of the view that Homer's every word is to be taken literally, quotes, in answer to those who hold that the treasures of Hissarlik are the treasures of Troy, this speech of Hector's:—

"νῦν δὲ δὴ ἐξαπόλωλε δόμων κειμήλια καλὰ·
πολλὰ δὲ δὴ Φρυγίην καὶ Μρονίην ἐρατεινὴν
κτῆματα περναμέν' ἔκει."—*Iliad* xviii., 288.

Either, Mr. Müller argues, "Hector lied" when he said "the lovely treasures had vanished from the houses to be sold in Phrygia and Maeonia," or the treasures of Hissarlik are not those of Troy. But even as a sportive argument, which of course is all that Mr. Müller intends this to be, what is it worth? When Priam wishes to ransom the body of Hector, he takes (*Iliad* xxiv., 231) ten whole talents of gold, glittering tripods, goblets, and a great Thracian cup, to offer Achilles. Thus, of course, Hector only spoke generally when he said the "gear had perished from the halls, and many a loom has gone to Maeonia and Phrygia." More may well have been left than the cup, phial, and head-dresses found by Dr. Schliemann.

The Homeric account of the death of Agamemnon contains more discrepancies than Mr. Müller has thought it worth while to note. In *Od.* iv., 530, the king falls at a feast in Aegisthus' house, on the marches (*ἀγροῦ ἐπ' ἐσχάτῃν*). In *Od.* iii., 234, he dies *ἐφέστιος*, which, I presume, may be rendered "on his own hearthstone." In *Od.* iv. all the men of both parties, those with Agamemnon and the followers of Aegisthus, *perish utterly*. In *Od.* xi., 410-12, I think there was no resistance made—

"περὶ δ' ἄλλοι ἐταίροι
νολεμῶς κτείνοντο, σῶς δὲ ἀργιόδοτες."

Agamemnon himself (xi., 422-423) vainly tried, in death, to cast his hands about his sword-hilt. Thus Homer presents a variety of traditions. Pindar, says Mr. Müller, "certainly knew his Homer as well as we do," which is possible, because, though Mr. Müller "doubts whether we can anywhere prove the existence of a written literature before 500 B.C.," yet memory served men's turn. In the Vedic period youths learned the Vedas "letter for letter, accent for accent."

Pindar may have had an accomplished youth of this sort by him, though, if the tradition of the Pisistratean edition have any weight (which may be doubted), it is not likely that Pindar was so fortunate. According to the tradition, Pisistratus found Homer's poems, not remembered "accent for accent," but scattered and half forgotten. Pindar may have profited by the *editio princeps* of Onomacritus and his friends; otherwise the legend of the Athenian edition is either all wrong, or Pindar certainly did not "know Homer as well as we do." Pindar, as Mr. Müller says, "did not scruple to let Cassandra be killed at Amyclae in Laconia." Pausanias, too, says that the Amyclaeans pretended to possess her grave. Now, if we could only accept Homer's testimony, how easy it would be to explain this discrepancy! Menelaus lived at Amyclae, or at least Amyclae was within two miles of his home. He had a way of building cenotaphs. He raised one to Agamemnon, in Egypt, as soon as he heard of his death from Proteus (*Od.* iv., 584). What more natural than that, when he came home to Amyclae, he should erect another cenotaph of Cassandra. Round this empty tomb the legend that she was buried at Amyclae would inevitably grow. A. LANG.

ON THE WORD "WHARF" IN SHAKESPEARE.

Cambridge : March 25, 1878.

This word occurs twice; in both places it means "shore" or "bank." Schmidt (as usual) is quite right. He gives: "*wharf*, the bank of a river; the fat weed that roots itself in case on Lethæ wharf, *Hamlet*, I., v., 33; from the barge a strange invisible perfume hits the sense of the adjacent wharfs, *Antony*, II., ii., 218." The question naturally arises, what can this word, as thus used, have to do with the modern Eng. *wharf* as commonly understood? The answer is, I am bold to say, nothing whatever. But (1) what is the modern *wharf*? The answer is, that the word is properly Scandinavian, equivalent to Icel. *hvarf*, a shelter, O. Swed. *hvarf*, a shipbuilder's yard, now spelt *varf*, closely connected with O. Swed. *hvarfa*, a turn, order, layer, stratum (whence the notion of laying in order, whether for shipbuilding or as applied to merchandise). The etymology is from Icel. *hverfa*, equivalent to A.-S. *hweorfan*, to turn. The word was borrowed by Dutch in the form *werf*, and by German in the same form *werf*. In the latter case, it has by some been confused with G. *werfen*, to throw; but the Dutch form of that verb is *werpen*, and it is our English *warp*. According to Dr. Stratmann (who has been so fortunate as to obtain access to the proof-sheets of Mr. Furnivall's edition of Manning, a book still unpublished, though apparently in type in 1873), the word *wharf* occurs in Manning, p. 303. All that we need to observe at present is that the root of our *wharf* is the same as that which appears in A.-S. *hweorfan*, so that *wharf* is rightly spelt with initial *wh*.

But the word *wharf*, in the sense of bank or sea-shore, is misspelt. It should rather be *warf*, and even then it is a corruption—viz., of the M. E. *warth*. The derivation is from a Teutonic base *warā*, meaning "sea," illustrated by Fick in his *Vergleichendes Wörterbuch*, iii., 292; see Icel. *ver*, the sea, in Olesby and Vigfusson. Hence was formed A.-S. *werōth* or *warth*, meaning "sea-shore," or "shore," "bank." I met with an excellent example of it in revising the last proof of my edition of St. John's Gospel with the Lindisfarne MS., which gives on *tham warthe* as the rendering of the Latin *in litore* in St. John xxi., 4. A later example is in *Sir Gevaïn and the Grene Knight* (line 715), where it may mean either "a bank," or "a ford;" but a clearer example is in Morris's edition of *Alliterative Poems* (O., 339), in the story of Jonah. "The wal wendes at his wille and a warthe fyndez, and ther he brakez up the buyrne"—i.e. the whale wends at his will and finds a (convenient) bank, and there he vomits

the man up. Indeed, the word is not extinct. Halliwell gives: "*Worth*, in Herefordshire, a flat meadow close to a stream;" which is a mere extension of the sense from "bank" to "overflowed bank." This, by the way, is quite a distinct word from the Northern *wath*, a ford, sometimes incorrectly spelt *warth* (just as the A.-S. *læc*, a game, is now spelt *lark*); cf. Icel. *væð*, a ford; Lat. *uadum*; E. to *wade*.

The corruption of *warth* to *warf* is natural and easy enough; we have other examples, though they do not seem to have been much noticed. Easy ones are furnished by *stiff*, from A.-S. *stith*; to account for which Sommer, in his despair, invented A.-S. *stif*, which, of course, never occurs; and another is *strife*, from A.-S. *strith*, the equivalent of G. *streit*.

I submit, then, that it will be as well, in future, to distinguish between (1) *wharf*, a landing-place; (2) *warf* (Shakespeare's *wharf*), a bank; (3) *wath*, a ford. These are all from different roots, and none of them are connected with G. *werfen*, to warp. WALTER W. SEBAT.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, April 8.—5 P.M. London Institution: "The *Eucalyptus Globulus*," by Prof. R. Bentley.
8 P.M. Society of Arts (Cantor Lecture): "Some Researches on Proliferative Changes," by Dr. B. W. Richardson.
8.30 P.M. Geographical: "Travels in Western China and on the Eastern Borders of Tibet," by Capt. W. Gill; "The U. S. Topographical Survey of New Mexico," by T. W. Goad.
TUESDAY, April 9.—3 P.M. Royal Institution: "Protoplasmic Theory of Life," by Prof. A. H. Garrod.
8 P.M. Anthropological Institute: "On composite Portraits made by combining those of many different Figures," by F. Galton; "On Inductive Metrology," by W. M. Flinders-Petrie; "On the Game of Patolli in Ancient Mexico, and its probably Asiatic Origin," by E. B. Tylor.
8 P.M. Photographic.
8 P.M. Civil Engineers: "The Embankments of the River Thames," by E. Bazalgette.
WEDNESDAY, April 10.—7 P.M. Entomological.
8 P.M. Graphic. Geological.
8 P.M. Society of Arts.
THURSDAY, April 11.—3 P.M. Royal Institution: "Chemistry of the Organic World," by Prof. Dewar.

SCIENCE.

The Rhetoric of Aristotle. With a Commentary. By the late Edward Meredith Cope, M.A. (Cambridge: University Press, 1877.)

THIS work is in many ways creditable to the University of Cambridge. The solid and extensive erudition of Mr. Cope himself bears none the less speaking evidence to the value of the tradition which he continued, if it is not equally accompanied by those qualities of speculative originality and independent judgment which belong more to the individual writer than to his school. And while it must ever be regretted that a work so laborious should not have received the last touches of its author, the warmest admiration is due to Mr. Sandys, for the manly, unselfish, and unflinching spirit in which he has performed his most difficult and delicate task. A word of acknowledgment must also be accorded to Mr. Munro

for the full and carefully-considered tribute which he has paid to the memory of a man who deserved no less, and also for his valuable description of the impulse given by Dr. Kennedy to the study of Greek at Shrewsbury, where several of the best classical scholars of our generation were formed by the teachings of the present Professor of Greek at Cambridge.

Had Mr. Cope lived a few years longer, and had he escaped from the malady which, as we gather from his biographer, had, long ere he ceased to labour, stealthily undermined his powers, he might possibly have recast, in a better and more convenient shape, the materials which he had patiently accumulated. As it is, the reader of these notes is sometimes tempted to say of him, what Kent says in commending himself to Lear, that "the best of him is diligence." The commentary is, and probably will long remain, a valuable mine of illustrative information for the English student of the *Rhetoric*, but a mine that must be worked with care—not on account of any explosive quality in its pervading atmosphere, but because so much of crude or alien matter is mingled with the ore.

This seems to have arisen in part from some confusion of the teacher's function with that of the commentator. Mr. Cope often checks us when following his interpretation of some course of Aristotelian reasoning, until he shall have explained and illustrated some point of ordinary Greek grammar—such as the meaning of the adjective in *κός*, or some not infrequent use of *καί*, or the fact that *ἐγγύθεν* has the force of *ἐγγύς*, or the two chief senses of *μὲν οὖν*. This may have been useful in the lecture-room, but is certainly out of place in a commentary on Aristotle, where such grammatical observations as are directly in point, and only these, should be briefly indicated, or if discussed at length should be reserved for an appendix. And Mr. Cope's observations on the language, even where necessary, are not wholly satisfactory. He is generally accurate; but he is too much disposed to press definitions and distinctions beyond what can be ascertained from usage, and his mind is only partially emancipated from the influence of a method, of which, however, he latterly saw the defects. In the Appendix (D) to the second volume, in which we trace a distinct advance beyond the point of view implied in many of the notes, he writes:—

"The attempt to control the free expansion of the Greek language by rigorous rules which forbade the deviation from set forms of speech, and allowed for no irregularities of expression by which nice shades and varieties of thought and feeling might be conveyed; rules derived mostly from a somewhat limited observation, often from the usages of the tragic and comic writers alone, the least departure from which was to be summarily and peremptorily emended; this attempt, which was involved in the practice of scholars like Dawes, Porson, Elmsley, and Monk, and their followers, has been happily frustrated; and we have learned, chiefly under the guidance of Godfrey Hermann, to deal more liberally and logically with Greek grammar. That Hermann was infallible; that he did not sometimes overreach himself by his own ingenuity; that his nice and subtle distinctions in the interpretation of grammatical variations are always well-founded; or that he is always con-

sistent in his explanations, I will not take upon me to assert; but it may at least be said that in this branch of scholarship, the application of logic to Greek grammar, he has done more than any other scholar, past or present."

That is excellently said. But if Mr. Cope had always felt the full significance of these remarks, we should have been spared many attempts in his notes to bind in formulas what is in the act of expanding, and to find "canons" everywhere—definitions too precise even for Aristotle, and distinctions fine enough for Prodicus; a method, in short, by far more "logical" than "liberal." The habitual caution which is one of the most obvious characteristics of Mr. Cope's intellect seems to have withheld him from following consistently the guidance which in the above passage he admires.

The copious renderings of the more difficult places will be of value to many students, although here also the extreme tendency to analysis somewhat interferes with the main object of representing the meaning of the author. We seem to ourselves to be just getting at the heart of a difficult construction, or at the connexion of a paragraph, when our guide carries us off along a side path to remind us of some rule of syntax, or of the exact force of a particle. The pieces of translation are useful, but they would be more so if they were more condensed. It may be remarked in passing that Mr. Cope's manner of construing is more suitable for notes than for the translation of an entire work.

When from the explanation of the language, which forms so large a portion of this commentary, we turn to the discussion of logical and psychological questions, we find the same patient research, the same determination to be explicit, the same love of accurate definition. But we are also met by a similar inadequacy of method. Illustrations are heaped together, like lamps in a lamp-shop—not disposed so as to give most light. Quotation sometimes takes the place of argument, and there is a singular want of proportion in the use of authorities. One would barter many of the passages (however interesting) which are cited from Mr. Bain, or from Alexander Aphrodisiensis, or Sir William Hamilton, for a single apposite illustration from Aristotle himself, or a carefully-considered estimate of the relation in which some Aristotelian position stands to a corresponding theory of Plato. In a Platonic scholar like Mr. Cope, the poverty of this last element is surely remarkable. It is strange that he should not have seized the opportunity of contributing something towards the study of the filiation of Greek philosophical ideas. (But in order to do Mr. Cope justice in this respect, it would be necessary to review his Introduction to the *Rhetoric*, which was published in his lifetime and essentially forms part of the present work.) His acquaintance with the Greek orators has been of more service to him; and many of his happiest illustrations are derived from them.

Of his treatment of the text it would be unfair to speak at length without special study. His habitual adherence to tradition comes out here very strongly. And it detracts little from his judgment if, in devising a

remedy for desperate places, he has been outdone by Cobet, as in Book III., c. xi., § 6. See Shilleto's "Adversaria," appended to the third volume of this work, p. 227. Some critics may smile at Mr. Cope's assurance that a certain paragraph is "undoubtedly from the pen of Aristotle."

It may seem ungracious in reviewing the result of so much toil to have dwelt so long on its defective side. But it was necessary to warn the reader what he must expect to find. It remains to assure him that in spite of its defects, Cope's *Rhetoric* is a book of sterling value. If an English student wishes to have a full conception of what is contained in the *Rhetoric* of Aristotle, and, it must be added in candour, if he does not read German fluently, to Mr. Cope's edition he must go. Until some more scientific interpreter shall have made this book of Aristotle the study of half a lifetime; shall have determined the relation of the ideas contained in it to the other Aristotelian treatises, to the Platonic dialogues, to the lost works of earlier rhetoricians, and to the practice of the orators; shall have traced the various threads which connect the *Rhetoric* at many points with the realities of Hellenic life and literature; and shall have set all this forth with a methodical clearness which we vainly look for here, the present book will continue to be the standard English work upon the subject. And even should Mr. Cope's book be some day superseded, his long and exhausting labours will not have been in vain. For the materials which he has collected must always form part of the basis of such a work, even should his arrangement of them not prove to be the final structure. LEWIS CAMPBELL.

OBITUARY.

THE death is announced of three well-known German scholars, Albert Forbiger, Wilhelm Teuffel, and Gustav Wilmanns. Albert Forbiger, the son of Gottlieb Samuel Forbiger, rector of the Nicolai Schule at Leipzig, was born at Leipzig in 1798, and was educated first at his father's school, and afterwards at the Leipzig University. In 1824 he was appointed to a mastership in the Nicolai Schule, of which, in 1835, he was made rector. Among his pupils at this school was Max Müller. The writings by which he is best known are his *Handbuch der Alten Geographie* (Leipzig: 1842-1848); his edition of *Vergil* (4th edition, 1872-1875), and his *Hellas und Rom*, a series of popular sketches of the public and private life of the Greeks and Romans (1871-1874). His *Lucretius* is forgotten, yet he made one good emendation (5. 946, "magnus decursus aqual Clarus citat late sitientia sacula ferarum"). His Commentary on *Vergil* is a laborious and useful compilation, not so remarkable for originality as for industry in collecting the opinions of others.

W. S. TEUFFEL was born at Ludwigsburg, in Würtemberg, in 1820; from 1834 to 1838 he was in the seminary at Urach; from 1838 to 1842, in the Evangelical seminary at Tübingen, where, in 1844, he became a *privat docent*. In 1847 he became an assistant-master in the Gymnasium at Stuttgart; in 1849 extraordinary, and in 1857 ordinary, professor of classical philology at Tübingen. In 1864-1866 he brought out a second and thoroughly revised edition of Pauly's *Real-encyclopædie*; in 1870, his *History of Roman Literature* (3rd edition, 1875); and in 1871, his *Studien und Charakteristiken zur griechischen und römischen sowie zur deutschen Literaturgeschichte*. We believe that he intended to publish a history of Greek literature on the same plan as that of his

work on Roman literature, which is familiar to English readers in the translation of Dr. W. Wagner.

GUSTAV WILMANNS, who has died in his thirty-fourth year, published a useful volume of selections from Latin inscriptions at Berlin in 1873, and was engaged on the eighth volume of the *Corpus Inscriptionum Latinarum*, containing the African inscriptions.

THE eminent mineralogist, Dr. David Friedrich Wiser, died at Zürich on March 21, at the age of seventy-six. He had occupied himself for years almost exclusively with researches in the mineralogy of Switzerland, and for the last half-century has been the most zealous and scrupulous collector in the Confederacy. The perfection, method, and beauty of his Alpine collection was the wonder even of competent experts. A worthy resting-place is to be provided for it in the Polytechnicum at Zürich.

SCIENCE NOTES.

GEOLOGY.

Geology of Gibraltar.—An official visit to Gibraltar a few months ago enabled Prof. Ramsay and Dr. James Geikie to examine the geological structure of this peninsula. The prevailing rock is a limestone, probably of Jurassic age, but the rarity of fossils renders it far from easy to determine its precise geological position. Above the inclined limestone is a series of unfossiliferous shales, upon which the town is built. Both limestone and shale may be traced across the Straits to the opposite coast of Africa. These strata are overlain by various superficial deposits, of which the oldest is a breccia formed of an accumulation of angular blocks of limestone cemented into what is described as a "limestone agglomerate." Such a deposit could not have been formed, according to these observers, under the present conditions of climate and surface, and, in fact, frost and snow are recognised as having had a good deal to do with the formation and transport of the blocks. Another breccia, or limestone-agglomerate, is also described, and this, in like manner, is taken to indicate a severe climate. The second breccia is younger than the other, but still of great antiquity, and both deposits offer evidence of extensive denudation. Between the two agglomerates the authors place the well-known bone-breccias of the Gibraltar caves, which in the abundance of their organic remains contrast so strikingly with the unfossiliferous agglomerates. From the character of these remains it is inferred that the ossiferous rocks represent a genial climate; that they were in fact deposited during an interglacial period which intervened between the deposition of the two breccias. The authors, in recently laying their observations before the Geological Society, expressed their belief that neither the elevation of land nor the submergence of the Sahara, nor even the co-operation of both conditions, could account for the severe winter-climate necessary for the formation of the two agglomerated deposits; and they therefore seek the required conditions in that general lowering of temperature which is believed to have prevailed over so great an area of the northern hemisphere during Pleistocene times. A molar of *Elephas antiquus* has been obtained from deposits on the African coast; a discovery which is noteworthy since this is the first time that this species has been found in Africa, although, as Prof. Boyd Dawkins pointed out, we were already familiar with *E. meridionalis* from that area.

The Old Glaciers of the Mersey Basin.—An interesting pamphlet on this subject by Dr. Ricketts, of Birkenhead, has been reprinted from the *Proceedings* of the Liverpool Geological Society. It describes certain glacial deposits which were exposed in Happy Valley, a small tributary of the Mersey, and gives the author's interpretation of the sections. He believes that a study of these

deposits lends no support to the conclusions of the extreme glacialists, and he fails to find evidence of any enormous ice-sheet coming down from the north and filling the Irish Sea. Dr. Ricketts believes, on the contrary, that the Mersey valley and its tributaries were occupied by glaciers of merely local origin, in no case reaching a greater thickness than about 225 feet. In like manner many valleys in Cumberland, Wales, and Ireland were filled by local glaciers, and some of these, like the Mersey glacier, may have extended to the sea. There they would give birth to icebergs which, drifting into the bay of Liverpool and the estuary of the Mersey, would, on melting, deposit their freight of ice-marked pebbles, now preserved in the boulder-clay. In seeking to explain the alteration of climatal conditions by which the glaciation was brought about, Dr. Ricketts argues in favour of a depression in Central America. After pointing out the effect of such subsidence in allowing the equatorial waters of the Atlantic and Pacific Oceans to commingle, he traces the consequent effects in altering the climate of the northern hemisphere and in lowering the temperature of these latitudes.

Acadian Geology.—It was a happy thought of Dr. Dawson's to apply this attractive title to his well-known treatise on the Geology of Nova Scotia, New Brunswick, and the neighbouring islands. Acadia is indeed a modification of the old Micmac name by which the early French colonists were acquainted with what are now the maritime provinces of the Dominion of Canada. As a native of Nova Scotia, Dr. Dawson has taken great interest in its geology, and especially in the development of its mineral resources. A second edition of his work appeared about ten years ago; and a copy of the third edition (Macmillan and Co.), which has recently been issued, is now before us. In preparing this edition the author has left the body of his work untouched, and has thrown the additional matter into the shape of a supplement which occupies rather more than 100 pages. Of this course we cordially approve; for, as the supplement is now issued as an independent publication, it can be purchased separately by those who possess the last edition. The supplement contains a summary of the latest researches on the geological structure, the organic remains, and the mineral resources of Acadia. It should not be forgotten that many of the topics discussed in this volume—such as the structure and origin of coal—have a very wide interest, and the work may therefore be profitably read by those who care but little about local details.

The Extinct Vertebrata of New Mexico.—A beautifully-illustrated quarto volume on Vertebrate Palaeontology has been issued by the United States Geographical Survey West of the 100th Meridian, in charge of Lieut. Wheeler. The volume is devoted to Prof. Cope's description of fossil vertebrates collected in New Mexico during the season of 1874. A sketch of the geology of the Mesozoic and Tertiary beds of Northern New Mexico precedes the technical description of the fossils. Among the organic remains are several groups worthy of especial mention. Thus Dr. Cope describes the quadrupeds related to the lemurs, from the Eocene of the Rocky Mountains, and discusses their relation to the old lemurs found in the phosphatic deposits of the south of France. New light has been thrown upon the structure of the supposed lemurine mammals of the type described by the author as *Tomotherium*; and these are now separated as a distinct group under the name of *Mesodonta*. The term *Bunotheria* is proposed as the designation of a group of mammals which will include the Orodonta, Mesodonta, Insectivora, Tillodonta, and Taeniodonta. The first vertebrate remains ever obtained from the Trias of the Rocky Mountains are described in this volume. Prof. Cope was attached to the Wheeler Survey during the season of 1874, and personally collected a great number of the fossils

which he here describes. A preliminary Report on the fossils was issued soon after the completion of the field-work.

The Structure of *Coryphodon*.—Bones belonging to Prof. Owen's genus *Coryphodon* have been found in greater number in the Wasatch beds of New Mexico than in any other region of the world. Remains of more than 150 individuals were obtained during the Wheeler expedition of 1874; and in the volume cited in the last paragraph, Prof. Cope elucidates in full the structure of the skeleton. The American specimens were originally described under the name of *Bathmodon*, but have since been recognised as belonging to the genus *Coryphodon*. The brain cavity is of extremely small size compared with that of the skull. A complete cast of the cavity was obtained, and this shows that the brain must have been remarkable for the smallness of the cerebral hemispheres, and the cerebellum, for the large size of the region of the *corpora quadrigemina*, and for the enormous magnitude of the olfactory lobes. In profile the brain offers a suggestive resemblance to that of a lizard; nor would it be difficult to detect other reptilian features in the anatomy of this genus and its congeners. In general appearance the coryphodon probably resembled a bear, though the feet were more like those of the elephant. It possessed a tail of moderate length, but there is no evidence of a proboscis. It is probable that the creature had the shuffling, ambling gait of the elephant, and it certainly defended itself with its powerful tusks. In size the coryphodon seems to have varied from that of a tapir to that of an ox. The genus is placed in Prof. Cope's sub-order *Pentadonta*, which belongs to his new order *Amblypoda*.

Geology of the Western Territories.—We have recently received a volume of upwards of five hundred pages, forming the annual *Report* of the United States Geological and Geographical Survey of the Territories for the year 1874. It embraces a number of geological sketches descriptive of the structure of parts of Colorado, and shows the extent of work accomplished in a single season by Prof. Hayden and his staff. As much of the matter which it contains has appeared in a condensed form in the *Bulletins* of the Survey, which have been duly noticed in these columns, the volume scarcely calls for extended notice.

METEOROLOGY.

The Climate of Eastern Asia.—In our number for December 2, 1876, we noticed the appearance of the first instalment of the meteorological portion of von Schrenck's splendid work.* The second instalment has now been issued, and it may fairly be characterised as one of the most valuable contributions to climatology that has been published for many years. It is from the pen of Dr. Fritzsche, the Director of the Peking Observatory, who has during his nine years' tenure of that post published no less than twenty important papers relating to terrestrial physics. The present treatise is a monograph of the climate of Eastern Asia, and extends to one hundred and ten large quarto pages, with thirteen isothermal charts for the several months and for the year, which gives, in addition to purely meteorological information, the results of von Schrenck's investigations into the ocean-currents in the Western Pacific. The materials for the paper are supplied by all the available observations for the region in question, stretching from Manilla and Hongkong up to Yakutsk, while the most western of the Siberian stations which is employed is Urga, lying to the south of Lake Baikal. The charts are peculiarly valuable, inasmuch as at the time Dove published his isothermal tables the materials accessible for the east of Asia were very scanty.

* *Reisen und Forschungen im Amur Lande in den Jahren 1854-56.* Von Dr. L. von Schrenck. Vol. IV., pt. 2. (St. Petersburg, 1877.)

The Influence of Snow on Temperature.—In the *Austrian Journal* for February 1, Dr. Wojeikoff makes some short remarks on this subject, taking as his text the unusual warmth of the weather, together with the absence of snow, in Eastern European Russia last Christmas. He considers that this warmth has been due to the internal heat of the earth, and explains the action on the following three facts:—1. That no non-conducting stratum was interposed between the ground and the air, so that the lower atmospheric strata were warmed. 2. That the moisture of the soil promoted thermic equilibrium between the earth and the atmosphere. 3. That the deep cracks, which were very common, allowed access for the cold air to the interior of the ground. Dr. Wojeikoff points out the interest of the question as bearing on the causes which produce unusually low temperatures in Siberia and North-West America.

The Climate of Bombay.—Mr. Frederick Ohambers, the District Superintendent for the Bombay Presidency, has published a sketch of the meteorology of that region for the year 1876, with the view of seeking for the causes of occasional deficiency of the south-west Monsoon rains. The general result to which he is led is, that the same principles which explain the usual alternation of the seasons will also in a great measure afford the interpretation of the anomalies of the rainy system in different years.

The American Storm Warnings.—In the *Nautical Magazine* for March, Mr. R. H. Scott has published an analysis of the warnings which have been sent to Europe by the *New York Herald* during the year 1877. The result of the comparison shows that the percentage of the warnings which were apparently fully justified was 17.5, and of those which were partially so, 25; so that the total percentage of reasonable success is 42.5. We have, however, received a copy of the *Herald* of February 22, in which the results of a similar comparison, instituted by the staff of that journal, are given; and by this we find that a general percentage of success of 95 is claimed! However, the New York authorities take the accounts of newspaper correspondents as of equal authority with the reports from regular observers.

Sunspots and Rainfall.—Mr. Meldrum has reprinted, in the form of a pamphlet, an article which he has recently supplied to the *Mauritius Almanac*, in which he gives a *résumé* of the entire course of the sunspot enquiry which he set on foot about six years ago. The statement is useful, as the papers on the subject have appeared in so many different periodicals, but we cannot see that any new facts have been produced to show that the supposed connexion between sunspots and rain has more than a local existence.

Differences in Barometer Readings at Adjacent Stations.—M. E. Renou has published in the *Comptes Rendus* for February two notes on the differences he has observed between his barometrical readings at the Parc St. Maur and those at the Paris Observatory, distant about seven miles to the westward. The readings are not reduced to sea level, and M. Renou finds a regular progression in the monthly curve of differences, reaching its maximum in winter and a minimum in summer. In the individual months the figures are irregular, but show some remarkable facts. The noon value is about 0.03 millimètres above those for 9 A.M. and 3 P.M. in February, and about 0.06 millimètres below the corresponding values in October and November. This M. Renou seeks to explain by the fact that the waves of diurnal oscillation travel over the country, and that at the time that the fall is most rapid, at noon, the difference produced by the small difference of position between the two stations is greatest. It hardly appears, however, that he has made good his case. In a second note he refers these differences to the direction of the wind, and of course finds that the gradients show themselves.

The Hair Hygrometer.—Dr. Koppe, of Zürich, publishes in the *Austrian Journal* for February 15 an ardent plea for the reintroduction of the hair hygrometer. He shows by Prof. Wolf's experiments the utter untrustworthiness of observations with the wet and dry bulb thermometers near the freezing-point—a fact which is self-evident from the records of the self-registering thermometers given in the Quarterly Weather Reports—and argues that if at the central observatory of Zürich the experience of the instrument is unsatisfactory, it must be utterly undeserving of credit at outlying stations. The modern form of the hair hygrometer is due to the late Goldschmid of Zürich, and the main feature in it is, that while in the old instrument the hair is adjusted to indicate the true values of humidity by altering its length till the index marks 100 at a time of fog, in Goldschmid's instrument this adjustment can be effected at any time. A wooden frame covered with muslin is introduced into the case of the hygrometer. If this muslin be wet, the hair is at once brought into a state of complete saturation, whatever be the temperature or the hygrometrical condition of the air. The weight employed for stretching the hair is not more than half a gramme, while the average strength of a hair is 100 grammes. Dr. Koppe maintains that a hair so prepared will give very satisfactory results, and his practical experience is that one of these instruments has worked without deterioration for many years at Zürich. The actual arrangement proposed is a combination of the two types of instrument. The dry bulb thermometer is enclosed in the same case as the hair hygrometer, and the wet bulb thermometer is placed outside.

ZOOLOGY.

The Arctic Expedition.—We understand that Captain Feilden has nearly finished editing the scientific appendices to Sir George Nares' Narrative of the Expedition of 1875-6, and that the work will be very shortly published by Messrs. Sampson Low and Co. In these appendices abstracts will be given of the numerous papers published in various journals by the specialists to whom the collections formed by Captain Feilden and Mr. Hart have been submitted.

Indian Zoology.—The work of Dr. J. Anderson on the zoological collections formed by the Yunnan Expedition, and that of Mr. W. T. Blandford on those of the Yarkand Embassy, are both, we believe, rapidly progressing, but are still retarded by the necessary delays caused by the preparation of the plates in Europe. In ornithology we may draw attention to Colonel Godwin-Austen's reprint of Jerdon's standard work on *The Birds of India*. The original edition has been long out of print and consequently difficult to procure, and many working naturalists both in India and at home will welcome this new edition. Being a textual reproduction it may be quoted as the original, while the "Supplementary Notes" published by the author in the *Ibis* of 1871-72, are added in the form of an appendix. "These notes were the last work upon which Dr. Jerdon was employed, and the present reprint is thus a record of all he wrote in connexion with *The Birds of India* up to the time of his death." The island of Ceylon was not included in the limits to which Jerdon confined himself, and information regarding its very interesting avi-fauna has still to be gathered from various scattered memoirs, of which the most important is Mr. Holdsworth's excellent "Catalogue" published in the *Proceedings* of the Zoological Society in 1872. We have therefore had much pleasure in receiving the prospectus of a "History of the Birds of Ceylon," by Capt. W. Vincent Legge, R.A. Capt. Legge has spent more than eight years in the island, during which time he devoted all his leisure to the study of its ornithology. His work will be published in parts, and will form a quarto volume

of about 500 pages (uniform with the recent works of Dresser, Sharpe, &c.), and illustrated by about twenty-five coloured plates representing the more remarkable Ceylonese forms.

The New Guinea Echidnas.—Last year we remarked in these notes on the discovery in New Guinea of two species of Spiny Ant-eaters or Echidnas, being the first Monotremes known to exist beyond the limits of the Australian continent. Of these the first discovered, *Tachyglossus bruijini* of Peters and Doria, was only known from a skull, but two complete specimens have since been acquired by the Paris Museum, and form the subject of the first part of Prof. Gervais's *Ostéographie des Monotremes vivants et fossiles*. This handsome work (Paris: Bertrand) will consist of quarto volume of letter-press and a folio atlas of plates, uniform with the author's and Vanbeneden's *Ostéographie des Cétacés*. The present fascicle is entirely devoted to the above-mentioned specimens of *T. bruijini*, which M. Gervais finds to be so different from the Australian species both in external characters and osteology as to require generic distinction. He has not been fortunate, we think, in the selection of a name, for *Acanthoglossus* comes too close to *Acanthoglossa*, proposed for a genus of Coleoptera by Kraatz in 1859. M. Gervais does not think that this should be an obstacle (and he has a precedent in the mammalian genus *Mustela* and the piscine *Mustelus*), but for those who think otherwise he suggests the alternative title of *Pro-echidna*. It seems a pity that he has thus inflicted a synonym on his own offspring at birth; evils come in due course to genera as well as to children, and need hardly be forestalled. In Bruijn's Echidna there are only three toes provided with claws on each foot, the first and fifth digits being rudimentary; the rostrum is greatly elongated and somewhat arched, giving the skull a very curious resemblance to that of the Apteryx; while the skeleton has seventeen instead of fifteen dorsal vertebrae, and presents other minor peculiarities. The tongue is cylindrical and greatly elongated, the tip forming a sort of small scoop or gouge, armed with the horny tubercles which have suggested the name *Acanthoglossus*. The animals were taken in the mountains of Karons, in the north of New Guinea, where they are called *Nokdiak* by the natives, who hunt them with dogs, dig out their burrows, and eat their flesh. The second species, which replaces the above in the southern parts of the island, has been named *T. lawesi*, and is a true *Tachyglossus*, but little is recorded of it beyond Mr. Pierson Ramsay's short description in the second volume of the *Proceedings* of the Linnean Society of New South Wales. The fact of the two Papuan species being of different genera was not to have been anticipated, and raises some interesting questions in distribution.

Darwinism and the Spanish Church.—In the last number of the *Revue d'Anthropologie* will be found an abstract by M. L. Martinet of the Report of a synod of theologians, summoned by Bishop Urquinaona y Bidot to consider a work by Dr. Chil y Narango, entitled *Estudios de las islas Canarias*. Dr. Chil had unfortunately adopted the theory of the barbarism of primitive man, and in his Introduction had sketched the modern hypothesis of evolution. Consequently it is not surprising that his book should be declared *falsa, impia, escandalosa, y herética*. But the Church has not been content with vague denunciation; all copies of the work have been ordered to be surrendered by their possessors to the ecclesiastical authorities, and the author has been placed under the major excommunication, which in these "fortunate isles" still means social isolation. Writing under the late clerical government in France, M. Martinet not unnaturally asks *à quand notre tour?*

MEETINGS OF SOCIETIES.

METEOROLOGICAL SOCIETY.—(Wednesday, March 20.)

THE usual monthly meeting of this society was held on Wednesday, the 20th ult., at the Institution of Civil Engineers; Mr. C. Greaves, President, in the Chair. Mr. B. C. Smith was elected a Fellow. The discussion on Dr. Tripe's paper on "The Winter Climate of some English Sea-side Health Resorts" was resumed and concluded, after which the following papers were read:—"Notes on a Waterspout," by Captain W. Watson; "Notes on the Occurrence of Globular Lightning and of Waterspouts in county Donegal, Ireland," by M. Fitzgerald; and "Observations of Rainfall at Sea," by W. J. Black. The discussion on the subject of Waterspouts and Globular Lightning was adjourned till the next meeting on April 17.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, March 26.)

JOHN EVANS, Esq., D.C.L., F.R.S., President, in the Chair.—A paper was read by Mr. Francis A. Allen, "On the Original Range of the Papuan Race." This paper was a brief résumé of the opinions held by many anthropologists with regard to the origin, characteristics, and distribution of these races, and an attempt to prove that they once extended on the west as far as Africa and on the east as far as America. The writer especially dwelt upon the statements of Herodotus with regard to the Eastern and Western Ethiopians and the black Colchians, and referred to the legend of the Asiatic Memnon and the existence of black races in Central America within the historic period.—The director then read a paper by Dr. Julius von Haast, F.R.S., "On some Ancient Rock Paintings in New Zealand." The author considered that when these rock-paintings were carefully studied by archaeologists and linguists, they would prove that at one time there had been an introduction of a far higher civilisation than the Maories ever reached.

ROYAL SOCIETY OF LITERATURE.—(Wednesday, March 27.)

W. KNIGHTON, Esq., LL.D., in the Chair. Dr. Ingleby read a paper "On the Literary Career of a Shakspeare Forger." After a brief sketch of the origin and details of the Ireland Forgeries, Dr. Ingleby discussed the question of their authorship, which in December, 1855, had been reopened by Mr. Burn, who was then the editor of *Willis's Current Notes*. Mr. Burn attributed all the forgeries to the elder Ireland; but recently-discovered evidence confirms the older view, that W. H. Ireland was the sole concoctor and author of the hoax. Last summer the trustees of the British Museum purchased of a grandson of Samuel Ireland a mass of miscellaneous manuscript bearing upon the forgeries. These consist of three thick quarto volumes: 1. A scrapbook; 2. A volume of letters; 3. Samuel Ireland's journal; besides other books, deeds, papers, &c. Dr. Ingleby stated that he had examined this collection, and he found that its contents confirmed in every important particular the statements of W. H. Ireland, in his *Authentic Account* and his *Confessions*, and completely established the innocence of his father. Dr. Ingleby also exhibited sixteen volumes from his own library, being scarce tracts and other works of W. H. Ireland; also his MS. of *The Frognore Fête, Stanzas to Clara Fisher, Monody on Shakspeare*, &c.; his own copy of the *Authentic Account*, with twenty-eight insertions of specimens of forgery, verses in the handwriting of his mother, and a fine crayon portrait of her; and a volume of letters and verses addressed to Samuel Ireland.

ROYAL SOCIETY.—(Thursday, March 28.)

SIR JOSEPH HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On Putrescent Organic Matter in Potable Water," by G. Bischof; "On the Modifications of the Simple and Compound Eyes of Insects," by B. F. Lowe; "Measurements of Electrical Constants. No. II., on the Specific Inductive Capacities of certain Dielectrics," by J. E. H. Gordon; "On the Placentation of the Apes, with a Comparison of the Structure of their Placenta with that of the Human Female," by Prof. Turner; "On the Thermo-electric Properties of Liquids," by G. Gore.

SOCIETY OF ANTIQUARIES.—(Thursday, March 28.)

F. OUVREY, Esq., President, in the Chair. Mr. Leveson-Gower read an account of some deeds belonging to the Archbishop of Canterbury relating to the Manor of Addington, which were exhibited. They included grants of the manor from the Priors of St. Mary Overy, in the thirteenth century, and some of the deeds had fine seals, one bearing a squirrel, the arms of Squerries, from whom the park near Westerham derives its name. Mr. Gower also exhibited some tiles from Newhall, the house built by Wm. Gresham at Limsfield in the reign of Elizabeth, some of which were ornamented with Gresham's initials and his crest, a grasshopper.—Mr. Ferguson, the local secretary for Cumberland, exhibited two small bronze female heads found in the river Eden and in Black Friars Street, Carlisle, one of which had been used as an oil-bottle; a bronze griffin, ending in an acanthus leaf, found in Bank Street, of which the use was unknown; a stone figure, rudely executed, of a genius, bearing a cornucopia and a patera; an iron tool like a stabbing-axe; and two forged Roman coins recently made out of a pewter teapot.—Mr. Percival read an account of some documents, which were laid on the table, belonging to Sir John Lawson, of Burgh. The earliest of these, commencing about the year 1300, were grants of property near Burgh, and a grant of free warren by Edward III. to William de Richmond. His son was known as John de Burgh, and this name was retained by the family. John's son William was concerned in the Wars of the Roses, and among these deeds there is his appointment as Castellan of Prudhoe by George Duke of Clarence; and a protection granted to him and others by Henry VI., dated Bamborough Castle, December 8, 42 Hen. VI. This document bears Henry's signet, but not his sign-manual. It is certain that Queen Margaret was at Bamborough about this time, but it is not known where the king was, and the letter is not conclusive evidence, as the queen may have had his signet and used it in his absence. Mr. Thompson Watkins exhibited a photograph of a stone found under one of the buttresses of Woolhope church, Herefordshire. The figure of a female is roughly sculptured on it, and it probably formed part of a coffin lid in the thirteenth century. Mr. Charles Potter exhibited a rondache of leather with an iron boss, found with coins of Edward III. on the Cheshire shore of the Mersey at a spot which has apparently been flooded at some distant date.

FINE ART.

Œuvre de A. Mantegna: reproduit et publié par Amand-Durand. (Paris: Goupil & Co.; London: Dulau & Co., 1877.)

IT is to the ceaseless activity of the Paris art-workers we owe much that is trivial, that vitiates taste by the glamour of brilliant execution thrown over what is intrinsically mean and heartless, or enervates it by the false excitement created by what is meretricious and even in some instances absolutely loathsome, it must be admitted that to the nobler expression of French artistic industry we are often indebted for what is genuine, learned and elevating. This probably represents the true French instinct, which is essentially didactic. We may never receive from it work impressed with the deepest feeling of the Italian or English imagination, but under happier influences than those which have so long weighed on France we may hope for an art bright with the national gaiety without the satyr suggestion, and full of delicate sentiment; and though the heroic may always have a flavour of the theatre, it will never be without a certain dignity and elevation.

Among those who of late years have striven to raise the standard of taste no one is more deserving of honour than M. Amand-Durand: the steady persistence with which he has issued his reproductions of the works of

the great masters of the *burin* entitles him to the deepest gratitude of the art-students of every land. It must be remembered that his reproductions are no blurred and rotten photolithographs, that tantalise rather than satisfy; they are always carried out with the best French finish and dexterity of manipulation—in fact, line for line, they are exact facsimiles of the old engravings. In some cases, except from the newness of the paper, it would be impossible to distinguish them from the originals.

Of the several portfolios which M. Amand-Durand has sent out, the one at the head of our notice will possess the highest attractions for a perhaps at present small, but certainly increasing, circle of students. Mantegna, like Rembrandt, Donatello, and some very few other artists of the same individuality, has the faculty of asserting an absolute sway over the imagination of his admirers. They accept him unconditionally: criticism, if not flung aside with scorn and contempt, is simply quietly ignored. His faculty was so intense, was developed with such perfection, was in every direction so thoroughly satisfying that they feel that nothing can be added to his work with profit, or taken from it without the loss of some expression which is necessary to the charm of its personality; and when one considers that his themes deal with the deepest passion or the highest ideals of poetic symbolism one realises the impression he makes on those of strong and cultivated artistic sympathies. As a natural consequence of this fervid acceptance, he meets with equally strongly-expressed antipathy. Needless to say that he was a born painter, endowed with all artistic perceptions, with consummate executive power and unwearying energy and laboriousness; he lived, too, at the time most propitious for the development of these gifts, at the golden prime of art. The master-pieces of Lippo, Paolo Uccelli and Donatello had shown him what modern art had attained to, and the remains of ancient sculpture were within his reach to point to the ideal of an art of more perfected expression, if of more limited range.

Never also in modern times was there such enthusiasm for art, not only among the nobles and their Courts, but among all classes of the community; and thus circumstances and surroundings tended to bring out Mantegna's powers to their fullest extent. The stormy scenes that he must have witnessed in his youth, and that would have strongly stirred his imagination; his maturity passed during the thirty years of comparative tranquillity ending in 1494, the last that Italy was to enjoy before sinking to the hopeless degradation and dependence on the foreigner, of which, alas! Mantegna saw the commencement—all this is reflected in his work. Herein we see the motives of his subjects of agony and despair, of his profound sympathy with suffering and death. The *Sebastian* of the Belvedere Gallery, with its combination of the antique and the lithe, scarcely less perfect Italian form, is the martyrdom that must have fallen to the lot of countless Lombard husbandmen and shepherds—Mantegna himself was the son of a peasant—of the earlier years of the century; the sublime *Christ* and weeping *Maries* of the Brera,

contrasting the peaceful repose of death with the passionate despair of bereavement; these had been enacted in many an Italian homestead. To the brightness of Southern life we owe the calm beauty of his Madonnas; to the joyous chivalry of the Gonzaga Court, his *St. George*; and to the passion for antiquity which, though paralysing the creative literature of Italy, inspired the painter, who had so deeply studied nature, with Triumphs and Allegories that were instinct with warm and living imagination.

The motives which induced Mantegna to engrave, and the period when he commenced doing so, have been the subject of much discussion among the writers on chalcography. The former doubtless arose from the facility given by the art, recently invented by Finiguerra for the multiplication of his designs, which must have been eagerly sought after. These, as may be seen in the marvellous *Judith* of the Uffizi, must have cost considerable time. His own sensitiveness would not permit, and the fastidious judgment of connoisseurs would not accept, copies by pupils; but engraving enabled him to multiply examples of his works, each having the veritable touch of the master. After the taste for engravings had been developed, and artists appeared who confined themselves solely to the use of the *burin*, Mantegna undoubtedly availed himself of their assistance; at first only in part, but afterwards employing them wholly to render his designs.

As to the time when he first practised the art, at present nothing can be said with certainty. Vasari's statement that he began after the Roman visit, 1488–1490, has been shown to be erroneous; and the conclusions of many more recent writers are equally untrustworthy. The probability is that his first engravings may date from his visit to Florence in 1466, when he would have seen the works of Finiguerra, the earliest of which had been produced fourteen years before. Little, again, can be asserted as to the chronological order of Mantegna's engravings. They are so few, and all so markedly bear the impress of his powers, that the matter is hardly of great importance, though even on this point one would be glad to have certainty.

Bartsch attributes some twenty-four engravings to Mantegna; recent writers have already reduced this number, and probably closer investigation and more serious study will still further limit the catalogue. Carefully examining the series; noting the style of drawing and the marked execution, the strong grip of the line, in the more important compositions; bearing in mind the directions of the hatchings, from right to left, and remembering that in 1478, and perhaps earlier, Mantegna was already employing assistants—the conclusion arrived at by the present writer is that only thirteen prints are from the sole hand of the master: these are the *Flagellation*, the two *Sepulchres*, the *Descent from the Cross*, the *Descent into Limbo*, the *Risen Jesus*, the two *Madonnas*, *Hercules and Antaeus*, the two *Marine Monsters*, and two Bacchanalian groups; five other compositions—the four *Triumphs of Julius Caesar* and the *Hercules and Serpent*—having his work in them, but being partly executed by assistants.

It would exceed the limits of this article adequately to discuss a point involving much minute comparison of the prints; it must, therefore, with deference, be left to the consideration of the student.

The subject, if investigated to its full extent, would make a valuable contribution to the history of art; it should not only include an examination of the engravings attributed to Mantegna, but of those of the entire school of Paduan engravers of his period, of those who worked in his studio or on their own account. It would also be interesting to know whether the engravings we have of Mantegna are from pictures or designs: only one, the *Virgin of the Grotto*, is from an existing picture. Respecting the other *Madonna*, which suggests a Botticelli influence, neither Bartsch nor Passavant seems to have remarked that a rendering of it is to be found in a print by Giovanni Maria da Brescia: here she is in glory, with five saints standing below. Can this be an engraving of a lost picture by Mantegna? As pertaining to the master, it may be hoped that Herr Carl Brun will not omit treating this subject in his forthcoming *Life of Mantegna*; it is no secret that his diligent investigation has already been rewarded by the discovery of several important documents. One of them, which by his kind permission I am permitted to publish, throws light on the date of the engravings, and at the same time gives a curious picture of an episode in Mantuan life of the latter half of the fifteenth century. It was found by Herr Brun in researches among the archives at Mantua.

"Simone de Ardizoni di Reggio pittore al marchese Lodovico Gonzaga [à corrossa la carta] . . . vostra S. in che modo sono stato trattato in la vostra cita e per notificarve como me chiamo Simone di Ardizoni da Rezo pittore e taliatore de Volino, quando vene in Mantua Andrea Mantegna me fece oferte assai mostrando de essere mio amico et mi avendo longo tempo fa amicitia de Zoano Andrea pittore in Mantova raxonando con lui dicendomi che fu robato stampe designe e medalie mi mosse a compasione che fusse malle trattato ge disse de rifarge le dite stampe e ho lavorato a lui circa 4 mesi, como lo indemoniato Andrea Mantegna sepe che refaceva le dite stampe me mando a menazare per uno fiorentino zurando che me ne inpazzaria e oltra de questo una sera fui assaltato da el nepoto de Carlo de Maltone e pin de dece armati Zoano Andrea e mi per essere morti e di questo poso fare provo, e de novo per fare che non seguita la dita opera A. M. [Andrea Mantegna] a trovato certi ribaldi per servirle me ano acusato per Sodomito al maleficio e colui che me a acusato se chiama Zoano Luca da Novara el nodare che a lacusa e parento de Carlo Moltone. Essendo forastero forza me stata a fuzere e me ritrovo in Verona per compire le dite stampe, donda signore mio per mantenere lo onore voio che sapia V. Ex^{ta} in che modo se trata forastero in la vostra cita e se vostra S. fa destenere quello che ma acusato vedra se mai fece tale ribuldaria e trovava che ma fato acusare. Donda signore mio prego V. S. facia tale dimostracione de iusticia acio che non sia tentato mi, o, mei parenti de farne vendeta che credo havere cercato quaranta cita de che mai non me fui dicta pezo del nomo mio ma oramai Andrea Mantegna con so. superbia e dominio de Mantua e se vostra Sig^{ra} non reffrena per so casone intravignera de gran scandoli et umil^{te} me ricommando ha vostra S. Verona. Simon de Regio. . . . a di 15 . . . [corrossa la carta] . . . Ill^{mo} et Ex^{mo} D^o Ludovico Marchioni Mantue etc. A D^o meo sing^{mo} Mantue."

There is no known reference to the matter related in this letter, or even any other mention of the existence of Simone de Ardizoni da Reggio, and as the date is wanting we can only know that it could not have been written later than 1478, the year of Ludovico's death. Of course, as we have only one side of the story, judgment cannot be definitely pronounced; but the strong probability is that Zoan Andrea and Simone were pirating Mantegna's works, and that, indignant at the injustice, he frankly took the law into his own hands. From several known instances in the life of Mantegna, he must be admitted to have been deficient in that *pocho de paciencia* which the Marquis was so frequently preaching to him.

After what has been before stated it is unnecessary to say that the reproductions of Mantegna's engravings have been made with the same fidelity as preceding series published by M. Amand-Durand. In this instance one does not quite see the rule that guides his selection; we are glad to receive the fac-simile from Ottley and the portraits of Ludovico il Moro and Beatrice d'Este from the British Museum collection, but why was not the *Silenus and Cupids* from the same volume, which has a strong Mantegna character, also included?

Perhaps no two artists were more dissimilar in style than Mantegna and Rembrandt, yet it will be remembered that in the catalogue of the art-treasures of the latter was a portfolio of the works of Mantegna. Could the cast of Faustina in the same document, the saddest in the history of art, have been from Mantegna's marble, which it broke his heart to part from under the pressure of dire necessity? What, it may be asked, was the bond of sympathy between the great Dutch master and the equally great Italian? It will be found in the intensity, the profound dramatic power and marvellous execution, that Rembrandt himself possessed, and therefore could so well appreciate. Where these qualities are valued, there will due honour be given to the etchings of Rembrandt and the engravings of Mantegna.

H. WALLIS.

Milet et le Golfe Latmique. Par Olivier Rayet et Albert Thomas. 1^{re} Partie. (Paris, 1877.)

THIS, the first instalment of a work which has been looked forward to with high expectations, is well calculated to justify to, I hope, a very wide circle of readers, the grounds on which these expectations were based by the smaller number of those who were acquainted with the services of MM. Rayet and Thomas, the latter in his special capacity of an architect trained in the accuracy and refinement of classical architecture, and the former an archaeologist already known in particular for his historical and topographical researches, but also for his judgment and appreciation of works of ancient art. The text of the present issue deals first with the river Maeander, its source, confluent, and above all the habit of making land at its mouth for which it was remarkable among rivers in antiquity. To show the extent of this we have two careful and highly-finished maps by M. Rayet, the

one giving the modern coast line and the valley of the Maeander as it is now to be seen, the other presenting the coast line as, from a comparison of historical notices and actual features, it can be made out to have been in the fifth century B.C. and in the first and second centuries A.D. On this point several interesting questions in topography arise and are fully discussed in the text. When this has been done and a general view obtained of the natural features of the Maeander valley, we proceed to the history of the ancient towns connected with it. For the present we are limited to Tralles (Aidin), its site and history. Afterwards we are promised the more important cities of Magnesia on the Maeander, Priene, Miletus, and others. Among the plates already issued are two from Miletus, the one showing a very ancient marble lion and the other the archaic bronze Apollo in the Louvre. From this site much else is to be expected, since it was there that MM. Rayet and Thomas some years ago made extensive and successful excavations at the expense of the Barons G. and E. de Rothschild. The other plates, six in number, are devoted to the temple of Athene Polias at Priene, the original beauty of which is not yet altogether lost in its ruins. Before the arrival of MM. Rayet and Thomas in that neighbourhood these ruins had been explored by Mr. Pullan at the instance of the Dilettanti Society here. Specimens of the architectural members and all that could be brought away of sculpture and inscriptions were on that occasion presented to the British Museum. Naturally the publication of that part of the text which deals with Priene is looked forward to in this country with special interest. There are many difficulties to be met, not perhaps so much with regard to the architecture as to the inscriptions, which in this case are unusually important.

It will be seen that the most interesting and most valuable parts of this publication are still to come; but from what has already appeared, it is evident that this great wealth of material for classical architecture and archaeology could not have been in better hands. Of late we have had more than enough of confusion in dealing with ancient sites. The present work is therefore opportune, preserving as it does the old tradition of thoroughness, inexhaustible patience in research, and admirable skill in presenting the results. A. S. MURRAY.

SIR GEORGE GILBERT SCOTT.

SIR GEORGE GILBERT SCOTT, whose death we announced last week, has for many years been the most conspicuous member of his profession in England, and has been engaged on more works than probably ever before fell to the share of one man. Born in 1811, he saw the whole course of the Gothic movement from its early days, when the writings of Sir Walter Scott and the publications of John Britton and Augustus Pugin set a fashion which was more sentimental than practical, to the present time, when the teaching of the son of Augustus Pugin is bringing forth fruits which he could scarcely have foreseen, and which are a bewilderment to the majority of his surviving contemporaries. Sir Gilbert Scott began to practise early in his life, when architecture was at its lowest level, and it is no discredit to him that his first works are not free from the

faults of their times. But such a design as that of St. Giles's Church, Camberwell, produced, be it remembered, before the younger Pugin had revolutionised English architecture by the publication of his *True Principles*, shows him to have been then quite in the van of the revivers. His reputation became firmly established when his design was selected for the rebuilding of St. Nicholas's Church, Hamburg; and his works since then have been too numerous, and the chief of them are too well known, to need separate mention. The number of Cathedrals and other important old churches which have been entrusted to him for alteration has caused his name to be very closely associated in the popular mind with the process called "restoration," and there is danger that his future fame may suffer by this. He had a most perfect knowledge of ancient detail, and from a very few indications of it he could reproduce an ancient design with almost mathematical certainty. This facility no doubt often led him to carry restoration further than good modern criticism approves. But before we condemn him altogether we should remember that even now the advocates of a better manner of treating ancient monuments can scarcely obtain a hearing with the custodians of them. What he did with knowledge, and—so far at least as the remains of mediæval work were concerned—with a strong conservative instinct, he probably prevented others from doing ignorantly and destructively. Of the cathedrals which have passed through his hands, even those which have provoked the severest criticism contrast most favourably with Canterbury and some others for which he is not responsible.

Sir Gilbert's literary works are more archaeological than architectural. The chief of them is the paper which forms the nucleus of, and gives the title to, the *Gleanings from Westminster Abbey*, to which building he was architect. And it is to be the fitting resting-place of him who during his life has received all the conventional distinctions which could be bestowed on a member of his profession.

M. ALLEMANT'S EGYPTIAN COLLECTION.

IN a small ground-floor room in Princes Street, Hanover Square, there is now on view a peculiarly choice little collection of Egyptian antiquities, consisting chiefly of objects in bronze, and numbering some eight hundred pieces. Many of these come from sites hitherto unexplored, and are the fruit of excavations conducted by M. Allemand, who exhibits them. Attached first to the civil service of the Porte and subsequently to the military service of the Khedive, M. Allemand has enjoyed enviable advantages in the pursuit of his archaeological studies, and has passed several successive winters with friends whose Egyptian estates chanced to be encumbered (or enriched) with any of those ancient mounds that abound betwixt the Fyôom and the sea. To dig these mounds for nitre, so useful as "top-dressing," is the right of every native landlord; but the antiquities he may turn up are Government property, and liable to seizure. M. Allemand, however, by subsidising an army of fellaheen, has contrived to excavate not only nitre but antiquities—the former for his agricultural friends, the latter for himself. In this wise, nearly his whole collection was brought to light. The great mound of Athribis at Benha, certain mounds near Tintah and Damanhour, and numerous others in out-of-the-way nooks and corners of the littoral provinces, have been rifled of their buried treasures. Some yielded harvests rich beyond anticipation; while upon others labour and money were lavished in vain. The only results obtained, for instance, from a mound locally known as Kom Thoroudjé were two glass bottles—one of which, yet filled with powdered carmine, may have pertained to the toilette-service of some daughter of Pharaoh. Another unknown "Kom" repaid the t

of months with but a single scarab. Of that scarab (No. 718), which is of exquisite execution and picked out in gold enamel, an enthusiast might almost say, however, that it is worth the cost. The material is a black vitreous paste; the subject, a mummy borne on the back of a running lion, followed by Anubis, the jackal-headed god of embalment and sepulture. Anubis here fills his rôle of escort to Hades, having charge of the dead, and urging the lion forward with uplifted staff. I need but indicate the obvious link between this lion which transports the mummy bodily to the lower world, and the lion-shaped funeral couch on which the dead repose in all representations of sepulchral ceremonies.

Though not absolutely virgin, the great mound at Benha would seem to have furnished the bulk of M. Allemand's spoils. Foremost among these ranks a superb bull in almost solid metal, measuring twenty inches in length by about fifteen in height. This grand bronze, green with the precious rust of antiquity, dates from the ninth year of Augustus, and unites to the heroic freedom and large modelling of the best Roman period a finish so consummate that the very coat of the beast, turned and clinging with sweat, is rendered with the most subtle variety. No. 181—a hand and arm in bronze (the hand clutching by the neck a hooded asp, the arm entwined in its coils), though but a fragment, is almost as fine, and dates from Ptolemaic times. Very noteworthy, also, is No. 163, a bronze menat, or collar-weight. Of this ornament, which plays so obscure and yet important a part in Egyptian symbolism, I do not remember to have seen a perfect example—unless in miniature, as an amulet—in any museum. The present specimen measures six inches in length, is surmounted by the usual Hathor-head crowned with the naos of Hor, and terminates in a medallion representing the heifer-goddess, on the one side walking, on the other lying down, amid reeds and bulrushes. The following objects from the same mound may also be singled out:—No. 116, a bronze ape entwined by a slender rope of gold twist; a small bronze sphinx (No. 44), *tempo* Rameses II.; a singular group in pale-green and brown porcelain, representing two children riding back to back, the one on a lion, the other on a horse; and, most curious of all, a caricature head in terra-cotta (No. 537), closely resembling in style the small comic masks in parti-coloured pastes which became popular in Egypt about the time of the Ptolemies, and of which the British Museum contains excellent specimens. This head, with its bumps, its baldness, its scattered tufts of mangy hair, and its exaggerated features, figures, oddly enough, in M. Allemand's catalogue as "étude anatomique."

From the supposed site of Pa-Rameses (the Raameses of the Bible), partly laid bare of late by M. Paponnet, comes a fine hawk-head (No. 9) in bronze, described as a vase-lid, but evidently a standard-top. Another standard-top (No. 16), in the form of a sacred bari, or ark, coated with green rust, and measuring 12 inches in length, is even more remarkable. Two sceptre-heads (No. 94 from Sakkarah, and No. 114 from Memphis), the first of Pharaonic, the second of Ptolemaic workmanship, also merit especial attention. Of the bronze statuettes, a hundred and twenty in number, the following are among the choicest:—No. 176, a small replica of the famous statue of Queen Amenirites, found, like the alabaster original, at Karnak, but wanting the lotus sceptre; No. 90, Nehem-sou or Nehimeou, the rare Hermopolitan Hathor, with eyes, head-dress, tiny bracelets, and other ornaments in gold enamel; a graceful Neith (No. 43) from Abydos; a magnificently modelled Thoth (No. 28), in perfect preservation, also from Abydos; and an Isis (No. 40), with drooping wings, apparently in the act of reciting the first Evocation of the Book of Lamentations. Nor must I omit Nos. 25 and 89, Anhur and Maut; the former from Teni, or This, the most ancient

of Egyptian capitals, whereof he was the local deity; the latter from Memphis. The delicate silver-work with which these admirable bronzes are inlaid marks a special era in the metallurgic arts of Egypt, and recalls a similarly damascened statuette of probably the XXIIInd Dynasty, in the British Museum.

The scarabæi of this collection, though few, number among other precious specimens a cartouche of Menkara, the builder of the third pyramid, and that of Ra-Set, a shepherd-king known till now by no other monument than an amulet at Boolak. Some objects in carved wood, glass, porcelain, terra-cotta, &c., complete the collection, which is described at length in a catalogue *raisonné* from the pen of M. Allemand. This catalogue, based apparently on the renowned *Notice des Monuments* of Mariette-Bey, is a creditable and laborious performance, which, however, would benefit by further revision.

The collection is for sale *en bloc*. Is it too much to hope that it may be purchased by the trustees of the British Museum? Few lovers of the best fine art of ancient Egypt would be content, I imagine, to see M. Allemand's bronzes follow General Cesnola's Cypriote treasures across the Atlantic.

AMELIA B. EDWARDS.

THE FRENCH GALLERY.

THE well-known room at 120 Pall Mall contains, in this its twenty-sixth exhibition, a good number of very skilful and sightly pictures of the various Continental Schools; several being, indeed, surprisingly dexterous and complete, although there is not anything of first-class pretensions. We will take the pictures according to the various schools represented.

French School.—As conspicuous exhibitors, we should perhaps name first M. de Neuville and M. Billet. De Neuville's work, painted last year, is *A Struggle at the Styrian Railway-Station, Battle of Forbach, August 6, 1870*, showing the desperate musketry-duel between the Germans, who had got possession of the railway-buildings, and the French, who defended, but could not defend for long, the platforms and the foot-bridge over the line. The railway-vans and other such adjuncts form a familiar and not exactly pictorial, and yet in their way an effective, element in the scene. It would be difficult to paint such a subject with more of dash and energy, and at the same time with a steadier control over its significance and its ensemble, than is here done by M. de Neuville. His merits in work of this kind are now so well understood and prized that we are dispensed from enlarging upon them. M. Billet's *Faggot-gatherers* was painted in 1874, and we think he has since then overcome in some degree the excessive opacity of pigment which mars this otherwise very able, solid, and sensible production. The day is one of hot and moderately bright sunshine: four women and girls, one with a baby, are resting from labour in a green open glade of a half-cleared forest. Of course, from a different point of view, a small Meissonier ranks higher in importance than even a large De Neuville or Billet: nor, indeed, is the Meissonier in the present collection a particularly small one, but rather well-sized than the contrary, tried by its author's wonted standard. It is named *The Savant*; and represents a man of the Molière period, in early middle age, seated at his table, and perusing a manuscript. Books load the table, and are piled on the large chair to the student's left; one has fallen to the floor. We need not say that this picture is a masterpiece of its class—the handling equally facile and precise: one close touch of truth, which may stand as a sample of a score of others up and down the little canvas, is the crumpling at the edge of the scanty red-velvet tablecloth at the point where the volumes have been moved nearer together. Another painter who shows here to much advantage is Auguste Bonheur: his large picture of *Sheep-Pastures, South of France*, dark

and striking, is a pastoral almost epic in its natural dignity. We cannot say so much for the *Echo*, by Bertrand; a respectable studio-product, well enough conceived in arrangement of subject, but more model-like than nymph-like in nude form. *The Interior of a Harem*, by Constant, bright with an ugly brightness, and garishly cut up in colour; *Sunday at St. Philippe du Roule, Paris*, by Béraud, after the manner of De Nittis, but not quite so sparkling and *spirituel*; Ferrier's *Ketschen*, a large half-figure of a young woman sewing, deep-toned and able; Maignan's *Reliquaire*, which has more style in the general mode of painting than in the female visage; and two landscapes by Jacque and Diaz—are also observable among the French pictures.

Spanish and Italian Schools.—In this section we find a wondrous Domingo—*Card-Players*; a production of last year, of microscopic neatness and felicity of touch, not excluding freedom too. It would be difficult to cite, from any school of any epoch, a specimen of more absolute and gifted precision. Hardly less perfect is the little figure-piece by Quadroni, which has the further merit of being, in stage parlance, a capital "character-part." His *Qui va là?* shows us an aged nobleman of the *ancien régime*, occupied with a newspaper, and studying a large map hanging on the wall, in the society of his two pet dogs; he turns sharply round at the creak of approaching footsteps. L. Jimenez contributes *A Musical Jury*. Six Spanish amateurs, of well-varied physiognomy, in the costume of about 1790, are seated to assess the deservings of a lean and lengthy violinist: a seventh enters after the performance has begun, and raises his cocked hat as he crosses the threshold. The painter's caricaturist tendency is very apparent here, but has been kept under reasonable control, and his neatness of hand is, as usual, most remarkable; the exceedingly white floor would bear a little toning down. Another painter of the same surname, J. Jimenez, exhibits a very choice little work, *The Bird-fancier*. Palmaroli is not here at his best. *A Sonata*, a handsome lady of the Empire period, agreeable though it decidedly is, has much less point and individuality than we are wont to find in Palmaroli's works: *Hide and Seek* shows more of these qualities, though it is not a very striking example. Here a lady in sky-blue silk, who has filched the doll from her little girl, is hiding behind a cheval-glass in her dressing-room, while the child enters, and takes the wrong direction. A peculiar turn is given to the colour-scheme of the composition by making the glass reflect a mass of yellow satin hangings, not otherwise apparent in the picture. *All Saints' Eve, a Religious Procession in Rome*, is an effective work by Corrodi: white penitents with their lit tapers growing momentarily brighter in the late dusk, as they file along a poor district by Tiber-side. Picturesqueness has been the painter's aim, and he has not failed to attain it. Two flaunting works by R. de Madrazo are examples of what to avoid, notwithstanding their cleverness, equally uncontested and incontestable.

German, Flemish, and Dutch Schools.—A most remarkable picture by the celebrated Pettenkofen—by no means a new one, for it is dated as far back as 1853—is in this gallery. We understand hardly anything of his had as yet come to England. It is named *La Charrette des Volontaires Hongrois*; and represents an overloaded open country cart, drawn at a great pace by three horses, which raise a blinding cloud of dust, in which a second cart, which follows behind, is half concealed from view; the dust, however, does not mount high enough to obscure the principal group. This is another example of extraordinary finish and exactness of delineation, combined with much simplicity of general result; it is only on attentive inspection that one perceives how much labour has gone to the work, and how near it approaches to perfection within its own range of attempt. A small picture by Kowalski, *Napoleon Retreating*

from Moscow, may be named along with this; its materials, if we substitute caked snow for dust, are (notwithstanding the historic elevation of the subject) not greatly dissimilar, and it brings the facts before us in an interesting, because no doubt a faithfully accurate, manner. The large sea-picture by Cogen, *Shrimpers at Panne, Belgium*, is grandly felt and highly impressive. The night is dark, with a moon which brightens out by fits; dark mounted figures move shorewards amid the green sea, with its white and whispering ridges of foam, the further horses immersed up to the thigh. Still more proficient than this in point of execution is *The Source of the River Neslette, Normandy*, by Van Marcke, showing a black bull and a white cow wading in the shallows beneath an overhanging tree, and under a rainy grey-clouded sky; a full and strong work, which might stand comparison with a fine typical Troyon. Two female half-figures by F. A. Kaulbach, who seems to have been popular in this gallery for some few seasons past, are by far the best specimens we have yet seen of his handiwork, and are indeed extremely pleasant in a combination of the delicate and the picturesque; *A German Lady of the Eighteenth Century* and *Summer Roses*—two amiable and captivating blondes. We are not particularly struck by the contribution of Gabriel Max, *Sancta Julia*—a well-known composition of a crucified youthful martyr-lady, contemplated with sympathetic awe by a man who is seated at the foot of the cross: we observe an announcement on the catalogue that "the celebrated pictures" by this artist, "*Head of our Saviour* and *Judas Iscariot*," are on view at the gallery from April 1, but they were not visible at the date of our visit. Other praiseworthy exhibitors are Munthe (*Bleaching Clothes in Holland*), Heffner (*Study from Nature*), Lanckow (*The Road to the Village*, and *Winter in Holland*), Brandt (*Polish Carriers*), Maris (*Near Amsterdam*), Kauffmann (*A Tyrolean Schoolmaster*), Veltin (*Sheep-shearing*), Roelofs (*A Dutch Homestead*), Israels (*Her Ain Fireside*), and Seiler (*A Halberdier*).

THE SOCIETY OF BRITISH ARTISTS.

THIS Society, having quitted their long-familiar premises in Suffolk Street, now hold for the first time their exhibition at No. 9 Conduit Street. We entered the gallery on March 30 with every inclination to discover that the Society were taking something of a new start; that they had made an effort to begin well in Conduit Street, and might be regarded with hope for the future. A very short experience showed us that any such expectation was utterly misplaced: the show is truly a deplorable one—far worse, as well as scantier, than the average exhibitions in Suffolk Street. There is really not one picture which can, even by courtesy, be called excellent; those which are fairly good are few; the "most tolerable and not to be endured," numerous; and those which are not to be endured without being at all tolerable are painfully frequent. It seems difficult to understand, for instance, how such a thing as Mr. Noble's *Frust and Marguerite* can be hung in any exhibition-room of the present day.

The picture which approaches nearest to being excellent is by Sir John Gilbert, *An Outpost*, painted in 1877: five horsemen of the period of our parliamentary war, stationary on duty, with a wild wind which persecutes the clouds and tatters them all over the sky, and which blows the troopers' cloaks, hair, and beards. Other horsemen are posted further off. This capital picture would be all the better were the colour somewhat clearer and less earthy. President Grant sends two portraits—a full-length of Mr. *Guthorne Hurdy*, executed in 1866, and *General the Hon. Charles Grey*; respectable productions, which, in a different sort of exhibition, would pass almost unremarked. Mr. Leighton also contributes two views from Granada; very minute ones, which wear an eleemosynary aspect here. Among the

figure-pieces what else shall we name? A large and somewhat ambitious but by no means masterly picture by Mr. Fitzgerald, *The Ransom*; *Pursued*, an Italian subject by Halswelle; *Farren's Cambridgeshire Potato-Field*, markedly reminiscent of a picture by Mr. Macbeth in last Academy exhibition, but otherwise approvable enough; *He's Gone*, by Ashton—two young ladies at a window overlooking the park, rather bright and graceful; two decidedly poor specimens of Donaldson, *The Marriage of the Burgomaster's Daughter*, and *The Pier Band*; *Between the Lights*, by Gadsby, a small girl warming her fingers at the fire; *Mandradì Cavalli*, by Raggio; and a brace of small works by Marsh and Pavy.

Of the landscapes, about the best is that by Mr. C. Collins, *Sheep-Washing at Boxhill Bridge, Surrey*—respectable, but not exceeding an ordinary standard. Mr. Edwin Ellis seems too much inclined to the slap-dash this year, and has not done such adequate justice to his powers as in some previous exhibitions: and it will be enough merely to name Messrs. C. W. Wyllie, A. Robinson, Finnie, Kerr, and Meyer. *Thirlmere, from Raven Crag, Cumberland*, by Mr. George Cole, may attract at present some attention from its subject, not from any superior qualities of art that it displays. *Hours of Idleness* is a large picture, and a very fair one, of hounds in kennel, by Mr. Emms. The water-colours include nothing of particular mark. Perhaps *The Orphans*, by Mr. W. R. Dickinson, is the most noticeable—two growing girls with their grandmother—the expressions having a certain emotional intensity which recalls to some extent the manner of Mr. Holl.

PICTURES FOR THE ACADEMY AND THE GROSVENOR, &c.

OUT of the endless multitude of pictures which have been sent in this week to the Royal Academy and the Grosvenor Gallery, and the only smaller number of those which have been "on view" at the studios of their artists, or at some intermediate halting-place, we may specify a very few. Messrs. Pilgeram and Lefèvre, 1A King Street, St. James's Square, collected the works of Messrs. Alma-Tadema, Vanatelli, Nicol, Mesdag, and Israels. Mr. Alma-Tadema's pictures are seven, only one of which, but that the most important, goes to the Academy. This is the life-sized figure named *A Sculptor's Model*, which was displayed last year in Berlin, and there secured, as it could not fail to do, a great deal of notice. The other examples are entitled *Cherries*, a large recumbent female figure, painted in 1873; *A Bacchante*, recently engraved; *Hide-and-Seek*, a Roman or Pompeian scene; and three companion subjects, *Painters*, *Sculptors*, and *Architects*, two of them Greek, and the third Roman. This last is an admirable specimen; and not less so *The Painters*, a number of artists studying a naked female model from various points of view. Vanatelli's picture is *A Procession at Venice*, crossing a bridge of boats, a work of much ability, notwithstanding some crudity of colour. Mr. Nicol's principal—to us by no means attractive—picture is named *The Missing Boat*. Mesdag contributes *Daybreak, Scheveningen*, in a rather Whistlerish style; and Israels, *The Return from the Fields*, labourers wheeling potatoes homeward by twilight. Mr. Cecil Lawson has completed a work of very considerable size and conspicuous ability, *In the Minister's Garden*, which is termed "a tribute to the memory of Oliver Goldsmith;" not that it portrays any of the scenes with which that poet was associated, for the country is from the neighbourhood of Aldershot, but because the painter wishes to make us think about the *Deserted Village*, and its clergyman "passing rich on forty pounds a year." The same artist displayed *Strayed, a Moonlight Pastoral*; also *The Wet Moon, Old Battersea*, and *In the Marsh-land*—the latter two for the Academy. Mr. F. W. Lawson has produced another of his suggestive

series of *Children of the Great City*, entitled *Dawn*. Mr. James Macbeth has a large landscape, *The Land of Argyll*—not only large, but vast in its impression on the eye; spacious tracts of heath-land and mountain range, with a great sense of scale and silence, and remarkable intensity of colour. He sends, moreover, two portraits—a gentleman seated, and another wading a stream as he fishes. Mr. Herkomer showed at the German Athenaeum, 51 Mortimer Street, an oil-picture for the Academy, *Eventide, a Scene in the Westminster Union*—the aged female inmates in their ward: it is certain to attract, as did the *Chelsea Pensioners* of two or three years ago, a large share of public attention, and to repay it. Also two water-colours for the Grosvenor Gallery: one of these more especially—an old Bavarian cottager with two children, entitled *Who Comes Here?*—is remarkable for the broad and unfaltering sweep of its execution. Mr. Hennessy contributes to the Academy *A View on the Thames*, and to the Grosvenor *A Cider Orchard in Normandy*, with groups of the peasantry. The Berlin Photographic Company, in Rathbone Place, collected a set of pictures by the two Achenbachs, Salentin, and four other German painters, all intended for Burlington House. Mr. Andrew Gow has prepared a telling subject—*The Public Reading of a War Despatch during the French Revolutionary Campaigns*. Mr. Edwin Ellis had several landscapes at the Gallery, 48 Pall Mall—one of the most striking being a mountain scene with drifting mist. Mr. Nettleship contributes a large and vigorous animal subject—a dog slaying a wolf which had attacked a child. The dog is a St. Bernard's dog well known all about Hampstead, and one of the grandest specimens of the breed to be seen near London. Last we have to mention a first *début* to which extraordinary interest attaches; it is that of Mr. Robert Barrett Browning, the son of the most illustrious poetess, and of one of the most illustrious poets of our time. Mr. Barrett Browning has been diligently studying for a few years past in Antwerp, under a painter of repute, and he has now sent over his first work for exhibition: it goes to the Royal Academy. The subject is one of those cunning Antwerpian craftsmen who work in brass: he is engaged in chasing a dish—an elderly and personable grey-bearded man, life-size. The primary interest of this work derives no doubt from its authorship: but besides this it has conspicuous promise of its own, and indeed in no small measure positive attainment. The handiwork generally is noticeably bold and solid, some of the object-painting (such as the specimens of brass-work) highly efficient and effective, and the whole treatment in good keeping—the accessories being what they should be, and where they should be.

W. M. ROSEKILL.

THE EXCAVATIONS AT OLYMPIA.

SINCE our last week's issue further reports of the Olympia excavations up to the middle of March have come to hand. The yield of the larger order of works of art continues to be disappointing. Two considerable pieces, however, in this kind, have been recovered from that which is historically the least interesting of the various structures in course of exploration, the Exedra at the foot of Kronion; these are, a well-preserved laureate head of Antoninus Pius, and a votive bull in marble. There is much interest in the promise—which, however, it will take some time to realise—held out by certain new appearances in the soil of the northern part of the Altis. First, a trench dug from south-west to north-east between the temples of Zeus and Hêrê, where the Pelopion should according to Pausanias have been found, has brought to light, not any traces of the Pelopion, but a singular stratum, nearly six feet thick, of perfectly black soil unlike the soil of any other part of the Altis: the question is whether this may not be

found, on analysis, to contain the remains of the great pyramidal Zeus-altar, built of the ashes of the sacrifices. Next, the extensive enclosure of the Prytaneion has been so far excavated as to show evidences of an inundation which seems to have bedded up a part of its area at an early period, and may therefore have covered some of its treasures in time to save them from rapine.

The further exploration of the Byzantine church due west of the Zeus-temple has yielded, among other results, no less than eleven pedestals with inscriptions, besides two lists of Olympic winners, all built into its floor. The number of remains in the same class discovered in the demolition of the Byzantine walls of defence abutting on the temple is becoming prodigious. Among the architectural fragments withdrawn from these walls, several are of peculiar interest from bearing distinct traces of colour. Among the many inscribed pedestals, one of the Roman period, and of peculiar richness, carried the statue of the pankratiast Ti. Claudius Rufus of Smyrna, and is covered on two sides with a peephism of the Elians giving him the citizenship of their State and recording how he prolonged the contest till starlight; on the third side, his own countrymen of Smyrna pay him a like honour. Two other pedestals, found near the north-east angle of the temple, are those of the statues of the Rhodian Eukles, and of Euthymos, the work of Pythagoras of Samos; both mentioned by Pausanias (vi. 6, section 2, 4), in connexion with the statue of Kallias, of which the pedestal had already been found in the same neighbourhood. At a distance of a little over twenty yards from the temple, the remains of a low wall have been traced, continuously along the south side and interruptedly elsewhere, which seems clearly to have served as a terrace or balustrade for statues. Here also have been found very many pedestals, one bearing the inscription of a winner, Timolas, and another with a tantalising fragment still adhering to it, in the shape of a life-sized bronze foot of consummate workmanship. Innumerable minute fragments of bronze statuary, found in all this part of the Altis, bespeak its former wealth, without giving us any single figure approximately complete or recognisable. On the other hand, the yield of minute votive objects, and especially objects in the archaic style, has exceeded all expectation. The black stratum already mentioned was full of these, and among them a bronze statuette of a warrior in the act of hurling a spear, about four inches high and of extremely archaic workmanship; here also were found three painted unguent-vases in the style known as Corinthian, one of them having an incised inscription with the name Semonides as dedicator. Copious relics of the same or still earlier phases of Greek civilisation continue to occur in the lowest stratum of soil on the east front of the temple; such as a four-inch bronze statuette of a woman with her left hand in her breast, the right stiffly holding up her dress, and the feet not parted; a section across the legs of a very primitive female statue in painted terra-cotta; a two-handled silver bowl, and many fragments of bronze vessels, ornamented with zigzags and concentric circles united by tangents; also bronze weights inscribed with the name of Zeus, weapons, and votive animals.

ART SALES.

WE shall next week be enabled to give the prices of the more important of the Rembrandts sold during the middle days of this week from the Cambridge University collections, and also of the famous Novar Turner drawings and pictures which come on for sale to-day; but the important sale to be recorded in the present column is that of the collection of Mr. F. W. Topham and his own remaining works. Mr. Topham's own works, dispersed by Messrs. Christie last Saturday, sold for

moderate prices, especially when the pleasant quality of most of his productions is duly considered. Among the water-colours, *Little Nell and her Grandfather* sold for 23l. 12s. 6d.; *A Welsh Landscape*, with figures of children, 70l.; *The Eve of the Festa*—one of such subjects in which he was happiest—89l. 5s. (Rathbone); *A Girl with a Lamb*, 110l. 5s. (Johnson); *Outside the Church*, 210l. (Agnew); and *Reading her Lover's Letter*, 236l. 5s. (Waithman). The pictures followed shortly upon these the artist's more important works in water-colour; and among them, *Voices of the Sea* fetched 178l. (Brown); the original sketch for the picture of the *Irish Pattern Fair, Connemara*, 126l. (Rathbone), and then the picture itself—a piece of charming and ingenious design and colour, in all probability the masterpiece of the artist—703l. (Brown). The engravings sold were unimportant. Afterwards, there was dispersed Mr. Topham's interesting collection of the works of brother artists. By David Cox there was a very desirable example, *A Breezy Day*—it realised 215l. 5s.; a drawing by Cox, with figures by F. Tayler, fell for 50l. 8s. By Peter de Wint there was *A Cornfield*, 80l. 17s., and another, the figures in which had been painted by Mr. Topham himself, which sold for 94l. 10s. A very important and elaborate drawing by E. Duncan, *Dutch Boats Riding Out a Gale*, realised 357l. (Eley); *A View in Venice*, by James Holland, 82l. 10s.; *The Earl of Quarterdeck*, a known example of the late Mr. Pinwell, whose drawings have perhaps not yet reached their full value, 51l. 9s.; *A Welsh Girl*, by Paul Falconer Poole, R.A., 115l. 10s. (Agnew). Among the oil-pictures we note a highly-finished replica, by Mr. Frith, of the engraved picture of *Hogarth before the Commandant at Calais*, which fell to Mr. Agnew's bid of 162l. 15s.; *Faces in the Fire*, by Mr. Frank Holl, 105l.; and one of James Holland's best-reputed pictures of the South, *The Port of Genoa*—a moonlight view—238l. 15s. (Brown). This was probably the most important sale of contemporary work that has thus far taken place during the present season.

NOTES ON ART AND ARCHAEOLOGY.

THE funeral of Sir Gilbert Scott is fixed to take place at Westminster Abbey to-day (Saturday) at twelve o'clock.

WE hear that Mr. Alfred Hunt will be represented at the Paris Exhibition by one of his larger pictures and by an elaborate water-colour drawing, which, though it was received with special approval on its first production at the room of the Society of Painters in Water-colours, has lately been re-worked to great advantage. This water-colour drawing represents the little lake of Coruisk in the Island of Skye, with the mountains round it, under an effect of passing and local shower. The scale of the scenery is large; the eye has in view a wide extent of desolate country, dark with the colours of the mountain and the colours of the storm. Little islands in the lake gleam like bits of emerald out of the general gloom and greyness. There is a wonderful effect of broken rainbow near the shore, low in the picture, the *finesse* of broken lights being in the best manner of a painter who is nothing if not observant of the subtlest effects in nature. The improvement wrought in the work since it has returned to the artist's hands by the sale, we believe, of some possessions of its original purchaser, is due in part to Mr. Hunt's more recent familiarity with the kindred though still grander scenery of Norway. The colour and form of the rocks in many parts of Norway are those of the wild scenery of Skye, and thus the artist has for all practical purposes made a second visit to the scenes of this drawing of some eight or ten years ago. No quality of permanent charm and interest which we are accustomed to find in Mr. Hunt's best work is absent from this exquisitely ordered

drawing, the whole of which is executed with that patience of care, which, combined with the most delicate of perceptive powers, has given Mr. Hunt his great place among English landscape painters, a place which the passing of time can only enlarge and confirm. The large oil picture, which is to accompany *Coruisk* to Paris, represents the neighbourhood of Coniston—or Coniston itself—a long line of mountain range, of which the heights and recesses, lights and shadows, are subtly indicated, and below this range verdant and flourishing meadows and English foliage of various greenness and of exquisite freshness in the moist air. Those pictures—alike only in their evidence of knowledge and penetrating eye and accomplished hand—will worthily represent in France the art of Mr. Hunt.

WE have seen recently at Messrs. Hogarth's, in Mount Street, a selection from the latest etchings of Mr. Seymour Haden, the eminent surgeon, from which it is evident that the skill of an artist in modern etching is generally maintained in his newer work. In view, however, of the extremely forcible translation of the work of Turner, in *Calais Pier*, which has lately been issued, that could hardly be doubted. Twelve etchings from nature are exhibited at Messrs. Hogarth's, and while for some the chief attraction will be found in such a one as the *Three Sisters*—a study of trees and ferns and underwood, the immediate pleasantness of which commends it to all beholders—others will feel more strongly drawn to such an effect of storm on the river as Mr. Haden has rendered with characteristic energy and boldness in his etching of *Battersea*. The movement of river life is agreeably suggested by the etching of *Purfleet*; but, since the *Agamemnon*, the artist has produced nothing so impressive as the new *Battersea*, with its storm to right, its boat, and boat sail rising against a gusty sky—save, indeed, the great *Calais Pier*, which as a free rendering of the famous work of Turner, has all the manly virtues proper to the best reproduction of work in itself so essentially vigorous and potent. The present sketches on copper take high rank among modern work of the aquafortist.

MR. HAMO THORNEYCROFT has sent to the Royal Academy a figure of heroic size of *Lot's Wife*. The head, of a severe beauty that reminds the spectator more of a Niobe or a Medea than of the Hebrew type, is turned back violently on the shoulders, and exhibits an extreme vivacity, which decreases as the figure descends, until the feet and the lower drapery are seen to be fading into the rigid substance of the rock salt. The modelling of the projecting shoulder, and of the neck, is particularly masterly, and this work will no doubt greatly increase the reputation of an artist who is rapidly taking a foremost place among our younger sculptors.

A COLLECTION of prints illustrating the antiquities, buildings, &c., of the county of Kent, is being formed for the Archbishop's library, Lambeth Palace. Those who have duplicate or other impressions are kindly asked to contribute. The ancient records of the See, further elucidated by Kentish books and prints, will then make this portion of the library at once valuable and unique.

AN attempt is being made by the French Government to revive the art of lithography which has been suffered to fall very much into disuse during the last few years, wherein so many new modes of reproduction have been invented and adopted. Lithography at the beginning of the century numbered such masters in France as Prud'hon, Géricault, H. Vernet, Bonington, Delacroix, Paul Huet, Gavarni and others, all of whom employed it with the greatest skill in perpetuating their works. Now it has almost died out in France, two or three artists at the most remaining faithful to it in the modern salons. Etching, in fact, which has been practised with so much perfection, especially by certain

French artists of late years, has completely taken its place; and it is doubtful whether lithography will ever be reinstated in popular favour. Nevertheless the French Government are no doubt right in trying to stimulate designers upon stone to new exertions. It is as well to see what can be done by lithography as compared with other processes of engraving. With this view the Director of Fine Arts has given a certain number of commissions to the few French lithographers who still remain for the reproduction in lithography of various monumental works. M. Sironz is to undertake Delacroix's ceiling in the Gallery of Apollo; M. Monilleron, *The Battle of the Cimbri*, by Decamps; M. Gilbert, *Jane Shore*, by Robert Fleury, a picture now in the Luxembourg; M. Paul Flandrin, the *Jesus Christ and the Little Children*, by Hippolyte Flandrin; M. François Théodore Rousseau's charming landscape in the Luxembourg, and M. Vernier Millet's celebrated *Angelus*; M. Jules Laurent, *The Glorification of St. Louis*, by Cabanel; and M. Chanvel, *The Encampment*, by Eug. Fromentin. The stones on which these works are executed are to be preserved in the Louvre.

In consequence of the Universal Exhibition the Cercle Artistique of the Place Vendôme will not hold its usual exhibition of water-colour drawings this summer. It is as well that some mercy should be extended to an art-loving public.

ABOUT 150 water-colour drawings have been sent by English artists to the French Universal Exhibition.

RUSSIAN art, it is stated, will be well represented at the French Exhibition. An exhibition has been lately held at the Academy of Arts in St. Petersburg of the paintings destined to be sent to France. Some of these have been seen before, but most are new, and among them there are reported to be several remarkable works. A large picture by Gerson of Copernicus expounding his system before an assembly of notable persons in Rome in 1500 holds the place of honour.

A NEW method for cleaning pictures is described by E. v. Bibra in a recent number of the *Journal für praktische Chemie*. A very indistinct oil-painting was freed from dust with a feather, washed with a sponge and water, and then covered for eight minutes with a layer of shaving soap. The soap was then washed off with a brush and the picture left to dry. It was next thoroughly cleaned with linen cloth soaked in nitro-benzine. The picture was now distinct, but the colours dull. Finally, it was treated with olive oil, and a coating of quick-drying varnish laid on.

A WRITER in the *Lancet*, commenting on some recent forgeries effected by means of chemical agents, speaks of the ease with which ink-stains, both old and new, can be taken out of paper. "We have seen," he says, "valuable prints on which an ink-bottle had been upset restored almost to their original state by the action of chloride lime, the print being floated in a common sponging-bath filled with a clear solution of the chloride." It should afterwards be well washed with plain water. This process is, of course, well known; but possessors of ink-stained prints may not be sorry to be reminded of it.

On the occasion of the marriage of the Princess Charlotte of Prussia, a carved oak chest was presented to her, executed by the pupils of the wood-carving establishment of the painter Magnussen in Schleswig. The chest was enriched by three reliefs, representing subjects taken from English history, and the lid rested on a rim of lions' heads. Altogether, this richly-ornamented work seems to have endeavoured to rival the magnificent marriage-coffers presented to brides of old, though we do not read that it was adorned, as they so often were, with paintings.

THE Louvre has lately received a most important addition, by the donation of M. Ilis de la Salle,

who, with rare generosity, has made over in his lifetime the whole of his valuable collection to the National Museum. This collection consists of no fewer than 434 drawings and studies by old and modern masters, and twenty paintings, some of them of high merit. The paintings are at present being temporarily exhibited in one of the galleries, but it is intended that a special room shall be devoted to the collection of M. de la Salle as soon as it can be arranged. The modern pictures are perhaps on the whole most noteworthy, but there are several fifteenth-century works in this collection, especially a beautiful and perfectly authenticated painting of *Herod's Feast*, by Fra Angelico, that claim attention.

BESIDE the rich gift of M. Ilis de la Salle, an important legacy has just been left to the Louvre by the late Comtesse Duchatel. This consists not of her whole collection, as has been said, but of the five most important pictures in it, pictures which perhaps the Louvre would not have been rich enough to purchase, for they are valued at 5-600,000 francs. They are *La Source* and *Oedipe*, by Ingres, two of his most important and most beautiful works, engraved some years ago in the *Gazette des Beaux-Arts*; *A Virgin and Saints*, with *Donor*, by Memling, a splendid work in excellent preservation, and undoubtedly authentic, almost comparable, it is said, with his celebrated *Adoration at Bruges*; and two finely painted exterior wings of an altar-piece by Antonio Moro. All these five works were lent by the Comtesse Duchatel to the Alsace-Lorraine Exhibition, where they attracted general observation. By the courtesy of the heirs of the Comtesse, to whom they were left during life, they have been immediately given up to the Louvre, where they will shortly be exhibited in a small salon expressly prepared to receive them.

A FINE painting by Courbet, called *La Vague*, and exhibited in the Salon of 1870, has just been bought for the Luxembourg for the sum of 20,000 fr. It is said to be one of the most powerful works of this powerful painter. The cross of the Légion d'Honneur was offered to him immediately after its exhibition, but he with his customary bluntness refused the honour.

M. CHARLES BLANC has been appointed to the Chair of Aesthetics and the History of Art recently created in the Collège de France.

A SOCIETY of Strassburg students have resolved to dedicate to Goethe a statue to be placed on the square in front of the university. The poet is to be represented in his youthful aspect, as he appeared when a student of the Strassburg University.

THE Cantons of Schwyz, Uri, Zug, Unterwalden, and Luzern have combined in a project for holding a Central-Swiss Exhibition in Luzern during the summer of 1879. The initiative committee, of which Bundesrath Knüfel is the president, have issued a conspectus of the "Groups" in which the exhibition will be arranged. They are ten in number: the first seven relate to manufacture and trade, the remaining three to art. "Group 8" will consist exclusively of the Central-Swiss painting, sculpture, and art-manufacture of earlier times; "Group 9" of the works of contemporary Central-Swiss artists and art-workers, including lace, pottery, wood and ivory carving, and similar articles of the local industry. No work will be admitted to the exhibition unless it is guaranteed as being wholly or partially a Central-Swiss production; where it is the latter, the fact must be stated to the committee, and it will be recorded in the catalogue.

WE have received from the eminent French printer, M. Jouaust, of the Librairie des Bibliophiles, the four latest numbers of his very artistic little publication *La Comédie Française*, biographical notices of the artists of the theatre accompanying the small etched portraits which proceed from the etching needle of Gaucherel.

M. Gaucherel, one of the veterans in a now fashionable art, has of course had various degrees of success in the accomplishment of this little work undertaken through the initiative of the enterprise of M. Jouaust. But even where the portraits have not been strikingly resembling—as in the case of Mlle. Bernhardt, whose mobile features are apt to defy the art of the portraitist—the composition of the subject and disposition of the figure are, with hardly an exception, artistic. The later numbers contain some excellent likenesses. Thus the subtlety of expression conveyed in the small portrait of Delaunay in *Le Menteur*—known to the reader of old English comedy under the name of *The Liar*—is at once a sufficient proof of the *finesse* of talent possessed by the etcher and of the skill of Delaunay in facial expression. The portrait of Clémentine Joussain is a less successful example of the ability of the artist, who cannot fail to be incited to his best exertions by the interest of his subject, and Mlle. Clémentine Joussain rests, alas! permanently in the ranks of the second-rate. The sketch of Maubant, courtly and chivalrous, in the great romantic piece of the greatest romantic poet, is full of frankness and grace, the gesture quite as much as the expression having been seized by M. Gaucherel with confident art. And, lastly, Mlle. Reichemberg, the type of theatrical simplicity—an *ingénue* indeed, but an *ingénue* of the footlights, a pastoral figure studied not so much from nature as from Dresden—she, too, with Suzel's folded hands, smoothed hair, and mouth of propriety, much as Paris has seen her during ten years of her perpetual youth, M. Gaucherel has depicted with a finish of expression which can only result from his quick, keen insight into the character of the model who has posed herself. The dainty prettiness of the accessories is akin to that in the art of M. Lalauze; but M. Gaucherel, unlike M. Lalauze, is not often, but always, yet more occupied with the character he is portraying than with the decorative pleasantness of furniture and background. M. Jouaust is bringing to a good issue the work he has undertaken. His book will remain among the most agreeable, though withal modest, reminiscences of the artistic life of the years through which we are passing.

PROF. R. RAHN gives a very full account in the *Sonntagsblatt* of the Berner Bund of the wall-paintings which were discovered a few weeks ago in the mountain-church at Neunkirch in the Canton of Schaffhausen. One of these, which is on the outside of the church, first came to light on the breaking-down of a neighbouring building. It is a mountain landscape, with a many-towered city, which Prof. Rahn takes to be Jerusalem. There are dim indications of figures in the foreground, one of whom is evidently a bishop. Three other pictures have been discovered in the interior of the church, on the north wall of the choir. It may be concluded from the costume of the figures that they were painted at the beginning of the sixteenth century, a very short time before the outburst of the Reformation; and Prof. Rahn sees indications that they were the work of one of the painters on day-wages (*Maler im Taglohn*) who at that period journeyed through the land in dozens. They are exceedingly coarse in drawing, colour, and conception, and are plainly from the same hand. The first of the three pictures on the north wall of the choir represents the Man of Sorrows, who is literally covered from head to foot with bloody wounds: the hands are folded on the breast, and a whip is thrust under one arm and a green reed under the other. The Virgin and St. John stand on either side. The donator and donatrix, each with a shield and armorial bearings, kneel at the feet of the Madonna and the Apostle. Two wall-paintings, which were brought to light some days later, on the east wall—an *Adoration of the Three Kings* and an *Adoration of the Shepherds*—are described by Prof. Rahn as far exceeding the others in concep-

tion and execution. In style and technical handling they resemble those which were discovered last year in the church at Oberwintherthur in the Canton of Zürich. The outlines, as in all the wall-paintings of the period, are thickly indicated, coarse red pencil lines being used for the flesh parts, and black pencil lines for the hair, garments, crowns, and accessories. The choice of colours in all the paintings is exceedingly limited, as was frequently the case with the journeyman painters; little but blue and green are employed for the background, and the naked parts appear to have been left uncoloured.

THE STAGE.

THE production at the Court Theatre of Mr. Wills's *Olivia*, of which play we shall have occasion to speak in detail in our general review of recent plays, is likely to be remembered as an almost unexampled instance of absolutely perfect stage management. The depreciatory remarks that are sometimes directed against stage carpentry and "upholstery" become pointless when the labours of the scenic artist, the costumier, and the furnisher are subordinated so completely not merely to good taste, but to the only legitimate object of scenic illustration—namely, that of lending aid to the author's conception. Musicians and artists of renown have contributed to enrich the work; and it may be assumed that it is the admirable taste and judgment of Mr. Hare that has reduced the whole to the order and harmony which are so conspicuous in this performance. Nor is the touching and beautiful play which Mr. Wills has written upon the lines of the romantic portion of Goldsmith's *Vicar of Wakefield* underserving of this reverent care and wise expenditure. It is still more to say that it is worthy of the grace and tenderness, the simple pathos, and the marvellously truthful and powerful expression of passion characterising Miss Ellen Terry's performance of the part of the heroine, not to speak of Mr. Vezin, Mr. Archer, Miss Aubrey, Mr. Terris, Mr. Denison, Mr. Norman Forbes, and the representatives of the other characters whose exertions contribute so much to the impression produced by the play.

If it had been produced at any other time, the revival of an old version of *The Vicar of Wakefield* at the Aquarium Theatre might have attracted, and would have deserved to attract, notice. It is fairly acted by most of the performers, and something more than fairly acted by Miss Litton as the heroine, Mrs. Stirling as Mrs. Primrose, and Mr. Farren as the Vicar. But this play, which blends the boisterous humours of the fair and the jail with the sorrows of *Olivia*, is but a commonplace production by the side of Mr. Wills's tender idyll; and just now it is hardly possible to avoid making comparison between the two works. As Mr. Wills's play has for some months been known to be in rehearsal, and indeed could not well have been produced without much longer and more careful preparation than appears to have been bestowed on the version at the Aquarium, meritorious as the latter is, it may be assumed that the curious fact that both pieces were produced on the same day has not been due to an attempt on the part of Mr. Hare to adopt the plans of another manager.

MUSIC.

A most interesting novelty was brought forward at the Crystal Palace on Saturday. This was Lalo's "Sinfonie Espagnole" for violin and orchestra, the solo part of which was played by Señor Sarasate, to whom the work is dedicated, and for whom, we believe, it was composed. M. Lalo is a French violinist and composer, of whose biography very little is known, owing, it is said, to his own reticence on the subject. A concerto in F from his pen was brought forward by Señor Sarasate on the occasion of the great violinist's

first appearance in this country, at a Philharmonic Concert in May, 1874, but it failed to produce any great impression. The work performed on Saturday is of far superior merit. Though described in the programme as a "concerto," the term can hardly be considered as strictly appropriate. The piece undoubtedly is a concerto in so far as it is written for the especial display of the solo violinist; but in its form it more nearly approaches that of the symphony. It contains the ordinary four movements, whereas a concerto, with very rare exceptions, has only three; and the whole design of the work is symphonic. The themes are not only interesting but of remarkable originality, while the orchestration is of unusual piquancy, the harp, triangle, and side-drum being employed with the happiest effect. The movements which strike the most on a first hearing are the *scherzando* and the finale; but throughout the whole work the interest never flags. The solo part was brilliantly played by Señor Sarasate, while the orchestral portion—the importance of which is too great to be called accompaniment—received full justice under the careful direction of Mr. Manns. Later in the afternoon Señor Sarasate played his clever fantasia on Gipsy Melodies, with pianoforte accompaniment. The rest of the concert was mostly composed of familiar materials, including Schubert's unfinished symphony in B minor, the overtures to *Egmont* and *Genoveva*, and vocal music by Herr Henschel.

It would be difficult to speak in too high terms of the performance at the Adelphi of the *Marriage of Figaro*, given last Thursday week by Mr. Rosa, and briefly recorded in our last issue. Excepting that the small part of Antonio was, perhaps, a little over-acted by Mr. Dodd, the rendering of the whole opera was simply faultless. A more charming Susanna than Miss Julia Gaylord it would be impossible to imagine; and though she sang while suffering from so severe a cold that an apology had to be made for her, her acting of the character was so excellent that one forgot altogether that she was not in good voice. As Cherubino Mdle. Marie Fechter strengthened the favourable impression she had produced in *Faust*; her conception of the bashful yet saucy page was admirable, while her unaffected and sympathetic singing was well suited to Mozart's music, the "Voi che sapete" receiving an undeniable encore. Mdme. Blanche Cole was an excellent representative of the Countess, while Mrs. Aynsley Cook made, as usual, a good deal out of the small part of Marcellina. Mr. F. H. Celli played Figaro, singing the music extremely well, and giving a very lively impersonation of the character. Mr. Ludwig, as the Count, was conscientious and painstaking, though the part hardly gives him so much scope for his special talents as some that he has undertaken, while the Bartolo of Mr. Aynsley Cook and the Basilio of Mr. Charles Lyall were two most excellent performances. Mozart's lovely accompaniments were played to perfection by the orchestra—happily without the wretched additional parts for trombones which may be heard at the Italian operas, but which Mr. Rosa is too true an artist to allow—while the chorus and *mise-en-scène* left nothing to desire. During the past week repetitions of the most favourite pieces of Mr. Rosa's repertoire have been given; the season is announced to conclude this evening.

MR. J. B. WELCH's annual concert at St. James's Hall, on Tuesday evening, deserves mention as being far superior to the average of professors' benefit concerts. On more than one previous occasion Mr. Welch has seized the opportunity to bring forward at his concert music not often to be heard. Thus last year he gave Schumann's *Requiem*, for the first time in London. On Tuesday he engaged a full orchestra, including many of our best players, to do justice to his programme. The chief works performed were Brahms's "Song of Destiny" ("Schicksalslied"),

the finale to *Loreley*, and Raff's "Elegy," Op. 186. In these the choir, consisting largely of Mr. Welch's pupils, showed excellent training, singing with much precision, though in Brahms's fine chorus, the attention to light and shade was not always all that could be desired. The instrumental pieces at the concert were Sullivan's "Graceful Dance," from his music to *Henry VIII.*, Mendelssohn's Capriccio in B minor for piano and orchestra (the solo part finely played by Mr. Franklin Taylor), and the overture to *Zampa*. Of the numerous vocalists who appeared, special mention should be made of Miss Ellen Lamb, a young lady whom we had not heard before, who possesses a very pleasing soprano voice, the upper part of which is particularly good, and who sang with considerable taste. Miss Anna Williams, Mr. Barton McGuckin, and Mr. Santley were also specially successful in the music allotted to them.

At Mr. Dannreuther's last musical evening, the programme included Xaver Scharwenka's piano quartet in F major, Weber's piano quartet in B flat, two movements from one of Bach's violin sonatas, played by Mr. Henry Holmes, and two transcriptions from Wagner's works for piano solo.

HERREN IGNAZ BRÜLL and George Henschel gave a pianoforte and vocal recital at St. James's Hall on Wednesday afternoon. Herr Brüll performed Beethoven's sonata in A flat, Op. 110, Chopin's Scherzo in B minor, Op. 20, and smaller pieces by Chopin, Henschel, Liszt, and himself; while Herr Henschel gave a very interesting selection from Schubert's "Winterreise," four of his own Lieder from the *Trompeter von Säckingen*, and songs by Beethoven, Schumann, Franz, Brahms, and Brüll. It need hardly be added that the performances of both artists were worthy of their programme.

THE first concert for the present season of the Bach Choir, conducted by Mr. Otto Goldschmidt, takes place at St. James's Hall this (Saturday) evening, when the works to be given are Bach's *Christmas Oratorio* (first three cantatas), Schumann's "New Year's Song" (first performance in London), Wesley's anthem, "O Lord, thou art my God," and Mendelssohn's glorious 114th Psalm, for eight-part chorus—one of the finest, though one of the least often heard, of his sacred works. A concert of unusual interest may be confidently expected.

MESSRS. PUTTICK AND SIMPSON have been instructed to sell on May 15 the whole of the unpublished works of the composer Rossini (154), consisting of vocal pieces for different voices, duets, choruses, dances, masses, &c. The whole were purchased of Madame Rossini, the widow of the great composer, to whom a very large sum was given for them.

The History of the Pianoforte, with an account of the Theory of Sound and the Construction of the Piano, has been entirely rewritten by Mr. Edgar Brinsmead. A new edition, that of the twenty-first thousand of this work, will be published on May 1 by Novello, Ewer and Co., 1 Berners Street, W. It will contain a large number of engravings that are descriptive of the subject.

AFTER an interval of more than ten years, Meyerbeer's *L'Etoile du Nord* was revived at the Opéra-Comique, Paris, on the 20th ult., with brilliant success. The parts of Catherine and Peter were sustained by Mdle. Océile Ritter and M. Giraudet, and the *ensemble* of the opera is said to have been one of the best, if not the very best, ever presented.

LAST Sunday week Mdme. Norman-Néruda made her first appearance since twelve years in Paris, at M. Pasdeloup's Concerts Populaires. She played Viotti's concerto in A minor (No. 22), and the Adagio from Spohr's "Scena cantante," with enormous success.

THE Leipzig *Signale* announces that Joachim Raff, the Director of the Conservatory of Music at Frankfort-on-Main, has invited Herr Julius

Stockhausen to take a post as principal Professor of Singing in that institution. Herr Stockhausen has accepted, and will therefore resign the directorship of the Stern'sche Gesangverein at Berlin, which he at present holds. The *Signale* also states that Mdme. Clara Schumann will take an engagement as teacher of the piano in the same Conservatory.

GEORGE LOVE'S CATALOGUE of Ancient DRAWINGS, rare ETCHINGS, and ENGRAVINGS (obtained from the most celebrated Collections), sent by post for two penny stamps.—61 Bunhill Row, London. Established above 60 years.

RED TAPE SUPERSEDED.

THE LESLIE DOCUMENT STRAPS.—Durable and Economical, and do not tear the paper. Sizes—12, 16, 24, 30, and 36 inches. Wholesale only of the Makers. G. WATERSTON, SONS, & STEWART, Edinburgh and London. Sold by all Wholesale and Retail Stationers.

HORNE'S POMPEIAN DECORATIONS.

ROBERT HORNE, HOUSE DECORATOR and PAPER-HANGING MANUFACTURER. 41 GRACECHURCH STREET, LONDON, E.C. By Special Appointment to His Majesty the King of Italy.

WYMAN & SONS,

PRINTERS, ENGRAVERS, LITHOGRAPHERS, BOOKBINDERS, AND STATIONERS.

BOOKWORK PRINTING.—WYMAN & SONS are prepared to forward INCLUSIVE ESTIMATES to Authors and Publishers for the COMPLETE PRODUCTION of their Works, bound ready for issue to the Public. NEWSPAPERS and PERIODICALS.—As Printers of many of the leading Publications of the day, WYMAN & SONS have had large and varied experience in the requirements of Periodical Literature, and have every facility for the Printing and Publishing, if desired, of Newspapers and Magazines in the best style, with promptitude and at moderate charges. Estimates forwarded. STATIONERY DEPARTMENT.—A large and well-selected Supply of Stationery of every description, and Office Fittings, kept always in Stock. Wyman's “Dictionary of Stationery” forwarded for twelve stamps. LINCOLN'S INN STEAM PRINTING & STATIONERY WORKS Nos. 74, 75, and 81 Great Queen Street, Lincoln's Inn Fields, London, W.C.

FURNISH your HOUSES or APARTMENTS

THROUGHOUT on MOEDER'S FIRE SYSTEM. The original, best, and most liberal. Cash prices. No extra charge for time given. Illustrated Price Catalogue, with full particulars of terms, post free. F. MOEDER, 248, 249, 250 Tottenham Court Road; and 16, 20, and 31 Cross Street, W.C. Established 1863.

F. MOEDER begs to announce that the whole of the above premises have just been rebuilt, specially adapted for the furniture trade, and now form one of the most commodious warehouses in the metropolis. Bed-room suites, from 6l. 6s. to 50 guineas. Drawing-room suites, from 9l. 9s. to 45 guineas. Dining-room suites, from 7l. 7s. to 40 guineas. And all other goods in great variety. F. MOEDER, 248, 249, 250 Tottenham Court Road; and 16, 20, and 31 Cross Street, W.C. Established 1863.

PHENIX FIRE OFFICE, LOMBARD STREET and CHANCERY CROSS, LONDON.—Established 1783.

Prompt and Liberal Loss Settlements. Insurances effected in all parts of the world. Secretaries, (GEORGE WM. LOVELL, JOHN J. BROOMFIELD.

EAGLE INSURANCE COMPANY.

79 FALM MALL. FOR LIVES ONLY. ESTABLISHED 1807. Net Premiums and Interest £206,518 Accumulated Funds £2,107,004 Also a Subscribed Capital of more than £1,500,000 Reports, Prospectuses, and Forms may be had at the Office, or from any of the Company's Agents, post free. GEORGE HUMPHREYS, Actuary and Secretary.

SUN LIFE ASSURANCE SOCIETY.

CHIEF OFFICE, 63 THREADNEEDLE STREET, LONDON. BRANCH OFFICE, 60 Charing Cross; And at Oxford Street, Corner of Vere Street. Established 1810.

The Managers have the pleasure of informing the Policy-holders that the Quinquennial Division of the Society's Profits has been made, and that an Option can now be exercised either to receive the Bonus in Cash, or apply it to increase the Sum assured or reduce the Premium equivalently.

The Cash Bonuses on Policies which have been in force more than Four Years average a return to the Policy-holders equal to more than One Annual Premium and a Half.

Assurances effected before Midsummer next will participate in the full Five Years' Bonus at the next Division of Profits.

The new Prospectus, containing important alterations, will be forwarded on application.

J. G. PRIESTLEY, Actuary.

WILLS' “There's no sweeter Tobacco comes from Virginia, and no better brand, than the ‘THREE CASTLES.’” Vide “The Virginians.”

Sold only in Packets and Cigarettes, protected by the Name and Trade Mark of

CASTLES.”

W. D. & H. O. WILLS, Bristol and London.

SATURDAY, APRIL 13, 1878.

No. 310, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

China. Ergebnisse Eigener Reisen und darauf gegründeter Studien, von Ferdinand Freiherrn von Richthofen. Erster Band. Einleitender Theil. Mit xxix Holzschnitten und xi Karten. (Berlin: Reimer, 1877.)

(First Notice.)

No one who even turns over this remarkable volume can greatly wonder at the hesitation with which one undertakes to give an idea of its nature and contents in a few columns. Not to every one, even of those who have read and admired a work on such a scale, is given that needful faculty of photographic reduction. There is hardly any drawback to the admiration with which we regard the book, but there is to our satisfaction. Mis-giving is inevitable when we see foundations so broad laid for the labours of one architect. What number of years must yet be needful to raise the pile to its crowning pinnacle? And then how many, in these days of hurry and over-occupation, and of study more and more specialised, will find time to master and appreciate a work so large in scope and execution? In regard to the first doubt we take comfort in the consideration that the author may still reasonably look forward to many industrious years. To the second question we can only reply that Wisdom is justified of all her children.

The Freiherr Ferdinand von Richthofen left Europe with the Prussian mission of Count Eulenberg in 1860, bent on scientific exploration in some field, to which he evidently and justly felt his vocation clear, but knowing not as yet where. It was not till eight years later that he found his theatre. But in all the interval, by journeys in India, in the Indo-Chinese regions and Malay Islands, and in North America, he was in training for the great work of his life. On the New Year's eve of 1868, being then in California, in conversation with his friend Prof. J. D. Whitney, he discussed the various regions of the earth that yet stood most in need of geological investigation:—

"We came to the conclusion that among all the countries that were civilised and were known in a general way, China was not only that which had been least investigated, but that which was in the highest degree deserving of investigation, at once because of its vast population, of its wealth of production, and of its growing importance in the traffic of the world. The investigation held forth promise of results of the most momentous bearing, both scientific and practical. Here, then, a task presented itself of gigantic measure, and I resolved to devote my whole energies to it for several years" (p. xxviii.).

To carry out this resolution Richthofen

landed at Shanghai in September, 1868. He buckled to his work without delay, and before long it stood out in its leading features clear before his eyes. So far as such a task could be achieved by one man in a limited number of years, it was this:—To lay solid foundations for the geographical comprehension of China, by determining the hypsometric relations of the surface in its main outlines, and ascertaining the law governing the axial directions of the mountain-ranges; by investigating the singular relation of China to the dischargeless regions of Asia on one side, and to the Tibetan Highlands on the other; and by tracing, so far as might be possible, the laws that have influenced climatic changes.

"I had hardly hoped," says the author, "to accomplish anything of really great importance in even one of these directions; and it was surprising to myself to experience how the great lines on which the mountain structure of this vast country is built up came out with ever-growing sharpness before me; while the series of the geological formations unrolled themselves with such completeness that in this respect also I was able to acquire clear conceptions. Had I been dealing with an European country, as little known, it would hardly have been possible in the same space of time to have made analogous progress in regard to an area one-tenth as great. Manifestly the general structure of China was projected on lines much more simple and more easy of apprehension" (pp. xxxi.-ii.).

But besides these scientific problems there were questions of more immediate practical bearing to be examined, and to these his attention was especially drawn by a commission which he received in 1870 from the Shanghai Chamber of Commerce. The practical and definite turn which this commission gave to his investigations was of great service to the traveller; and one result of his researches in this direction was to demonstrate that China in its wealth of coal is probably unmatched even by the United States of America.

The journeys undertaken by Baron Richthofen in furtherance of his great scheme continued from the latter part of 1868 till October 1872, when he sailed for Europe. They embraced a partial exploration, at least, of all the eighteen provinces of China except Kansuh, Yunnan, Kweichow, and Kwangsi. On his second journey (the exploration of the Yangtse Valley between Shanghai and Hankow) he was much interrupted by wet weather; but this never recurred, for China is so big a field that with a little experience and judgment a zone of exploration free from rain can be secured at every season of the year.

The letters which Baron Richthofen addressed to the Shanghai Chamber, printed in folio pamphlets at Shanghai in 1870-72, made known to those (probably few in number) who had the opportunity of reading them, the importance of his researches, as well as, in some measure, the extraordinary power and grasp with which he treated the scientific aspects of geography.

Originally the author thought of publishing in England a view of such of his investigations as especially touched practical questions. The scheme met with little encouragement; and, happily, the Emperor William granted such aid as facilitated the

publication of the mass of results in the actual handsome form. Though the present volume contains some admirable maps on a small scale, the detailed maps are still under preparation, and without them the detailed exposition of special studies would be impracticable. The present volume, therefore, deals only with two great, but in a manner general and introductory, aspects of China:—

(1) Its geographical relation to the continent of Asia, and in connexion with this a view of the formation and transformation of the steppe-lands, both in Central Asia and in other regions of the world, and a survey of the orographic skeleton of Central Asia, and of its extension into China.

(2) The perception of the influence of these physical relations on a great national history has led the author first to deal at considerable length with the Book *Yü-Kung*, the oldest literary monument bearing on Chinese geography, and thence to further studies, which have ended in his producing an elaborate review of the whole history of the knowledge of China, as acquired, first by the Chinese themselves, and secondly by Western nations.

These two large subjects fill the present volume. I cannot more briefly indicate my view of Baron Richthofen's capacity than in expressing the conviction that he has dealt with the second of the two branches of knowledge just mentioned with almost as great a grasp and mastery, as great a power of maintaining the interest of his readers, as with the first.

The second and third volumes will contain specific discussions of the geography and geology of China; of the varying density of population; and of the bearing of external structure upon that density and on the great lines of traffic; with detailed descriptions of the coal-fields and other matters connected with the relation of different products and of their diffusion to geological formation and climate. The author also proposes to treat of the results of his journeys in other Eastern countries, and to recur to problems of comparative geography which these journeys have suggested.

The fourth volume will be dedicated to Palaeontology, and will be the work of eminent specialists in science. The Atlas will contain not less than forty-four maps, prepared with the valuable aid of the younger Kiepert, and is expected to appear with the second volume.

I cannot attempt here to give even a general notion of Richthofen's physical exposition in the first part of the present volume. But I shall not greatly err if I say that the text and basis of this remarkable essay is found in that soil of Northern China to which the German name of *Löss* has been transferred from the analogous deposits in the Rhine Valley and on the Danube. The spread of this singular deposit over a great part of North China has influenced, not only the character of the landscape, but the spread of agriculture, the limits of civilisation, and the historical development of the States that have arisen on this soil, to such a degree as has hardly a parallel in any other part of the world. In the basin of the Wei River, on which stands Singanfu, the *Löss* is so predominant that its yellow hue affects the

whole landscape, and even tinges the atmosphere. Here was the core of early Chinese history, and here, as Richthofen has somewhere suggested, originated the use of the word *huang*, "yellow," as the symbol of the Earth, whence the *primaeva* Emperors were styled *Hwang-ti*, "Lords of the Earth," but more properly "Lords of the Yellow Löss!"

It is not possible for us to follow out the chain of argument by which Richthofen demonstrates the "sub-aërial" or atmospheric deposition of the Löss, but it is a fine specimen of physical reasoning. That deposition is still going on in the steppe-regions of Central Asia; and when as yet the Yellow River did not exist the Löss country of China was a steppe-region which in every point of view resembled the adjacent tracts of the interior. Change came, perhaps with the sinking of the land, and with the nearer approach of the sea and its influences, which gradually opened out the land-locked basins, and developed the great drain of the Yellow Lands, the Yellow River. The salts were washed out, the soil made fit for agriculture, and so in the converted steppe were laid the seeds of Chinese culture and empire.

With this glance at what is, after all, but a part, though a governing part, of the subject of the first section, we pass to the second section of this volume. But before doing so let us say a few words of externals. The work is set forth in beautiful style. Paper and print are excellent, but without inappropriate *luxe*. The few cuts, too, are very good, not *ad captandum*, but really illustrative of the text. The design on the binding is unique. In the background we see the Great Wall in bold black outline climbing the mountains of Shansi. In the foreground stands a long-necked tortoise, sculptured from the rock in a fashion of strange *primaeva* art, such as may have borne the memorial tablet of the great Shi-Hwang-ti himself on the avenue to his sepulchre; and this carries on its back a vast monolithic slab, with the brief superscription of the book, "CHINA VON F. V. RICHTHOFEN." It is wonderfully appropriate and suggestive to those who have eyes to see; not to those who begin to question in what Zoological Garden they can find a beast like this.

H. YULE.

Catiline, Clodius, and Tiberius. By Edward Spencer Beesly. (London: Chapman & Hall, 1878.)

PROF. BEESLY has here put together a few vigorous lectures upon Roman history which were delivered and separately published some ten years ago. In the first of these *Catiline* is brought before us, not as the reckless conspirator and ruffian which ancient history describes, but as the leader of the popular party, hounded on to desperate courses by the oligarchs, and Cicero their supple tool, who drove him to a rebel's death and blackened his memory for future ages. In the second we are asked to regard Clodius as a serious politician, and not merely as a loose gallant notorious for his scandalous frolics, becoming the desperado of the streets to revenge himself on Cicero and others for their damning evidence or

bitter gibes. This is followed by an able statement of the arguments in favour of the thesis (maintained also in Germany by Stahr and Freytag), that the Emperor Tiberius was scandalously defamed by the jealous and rancorous aristocracy of Rome, who feared his virtues and maligned his motives while he lived, and, thanks to the genius of Tacitus, stamped upon history a record of their undying hatred.

Startling as these conclusions may appear to many readers, they are not conceived in any spirit of caprice or literary paradox, but are earnestly enforced with weighty arguments and animated style, coloured with the sympathies and antipathies of present politics. It would be too much indeed to say that the writer has proved any of his points conclusively; for proof is scarcely possible in cases such as these, where such positive evidence as exists on one side of the question is disputed by the critic as prejudiced or absurd, while the evidence on which he does rely upon the other side is mainly drawn from analogies and probabilities, or the general laws of human nature. But at least he has shown that there is much of inconsistency or seeming contradiction in the current narrative which has been commonly accepted. If we may judge from the trenchant style in which he writes, Prof. Beesly is a good hater; and in the Roman oligarchs of the last age of the Republic he seems to find a worthy object for his scorn. Few would care to plead in the defence of the unscrupulous rulers whose organised brigandage wrung a wail of despair and agony from all the subject provinces of Rome. Yet it may seem that on some points the language which he uses, though possibly consistent with the facts, which are of course familiar to the writer, may mislead an inexperienced reader, or encourage the bias of a hasty partisan.

He speaks of *Catiline*, for example, as having "the populace of Rome on his side, and the peasantry throughout Italy groaning under an infamous government, and ripe for revolution." Now there can be no doubt that there was at that time in Italy a vast amount of misery among the toiling millions—a fearful waste of human life in the servile population, pauperism and degradation in the proletariat of the towns. But much of this was due to causes with which the government of the day could not directly grapple. There were the evils of slavery, as it was then practised through the civilised world, which were to last under the Empire till they were checked awhile by the exhaustion of the slave-markets of the East. There was the decay of the Italian yeomanry, due to a long series of political and economic causes, to which each age had contributed its share. Pauperism in the towns, depopulation in the country, were indeed steadily increasing, in the train of fatal consequences of the Social and Civil Wars, but the statesmen of the Empire long afterwards deplored that they were powerless to deal with the same evils. Much of the misery may be traced home to the selfishness and greed and criminal indifference of the rulers in times past, but the present age could not escape its legacy of evil, nor could its leaders be re-

sponsible for a state of things which they had not made, and could not themselves unmake without a social revolution of which none could foresee the issue. In the direct action of the government in Italy little can be proved that was rigorous or oppressive; the burden of taxation was not heavy; the stock examples of official outrages belong for the most part to an earlier generation, and out of the undoubted mass of discontent the grievances that could be promptly remedied were few.

In fairness to the oligarchs again, it must be owned that we look in vain among the popular leaders for any nobler policy or clearer aims of national wellbeing. It had not been so always. In the old days of constitutional privilege there were statesmen who distinctly realised and boldly strove for the interests of the plebs, and in Niebuhr's sympathetic pages something of the halo of martyrdom gathers round the names of Cassius and Maelius and Manlius. The Gracchi faced the economic evils connected with the changes in the property in land; Drusus spent himself in pleading for the claims of the Italians to be raised to the level of the favoured citizens of Rome. These statesmen had large far-reaching aims; contemporary slander, however busy with their names, imputed nothing worse than personal ambition. But the democrats of later days, what were their objects, what are their claims to our respectful sympathy? Prof. Beesly tells us that their characters "have been painted very black, without a shadow of evidence."

It is true that we cannot lay much stress in this respect on the reckless railings of political opponents, but we are justified at least in testing their patriotism and their wisdom by their actions. Representative government had received a fatal blow; the popular leaders could appeal from the Senate to the people, and rapidly pass sweeping bills through the mass-meetings of the tribes. But what are the legislative measures coupled with their names?

There is little evidence of any serious attempt to grapple with the abuses of provincial misrule, notoriously scandalous as were the evils. We have no proof that the democrats themselves were more clean-handed than their rivals in official life. The turbulence and disorder in the streets was a disgrace to Rome: the insecurity of the high roads, the economic panics, were a fatal hindrance to all industrial progress. The popular leaders did not improve matters by their measures in favour of political clubs and organised guilds; by encouraging needy spendthrifts to agitate for repudiation; by their liberal schemes of Poor Law expenditure, which made the proletariat of Rome the privileged pensioners of a subject world; by granting extraordinary powers to the generals, and leaving the liberties of the Empire at the mercy of the great proconsuls who were soon to quarrel for the exclusive tenure of the power which had passed from the *Comitia* to the Camp.

The Imperial system was a signal boon for a while at least to all civilised life, but its special blessings were unforeseen and quite uncared for by the chief agents in the Revolution. Many of them probably floated

only vaguely before the thoughts of Julius himself, vast as were his plans and commanding as his genius; and he, we know, was hampered in his work of reconstruction by the self-seeking greed and bounded aims of the professed reformers, who had helped him to destroy the old Republic but were looking next to share the spoil and build up again their shattered fortunes. Much even of Mommsen's chapter on the policy of the great Caesar reads like an after-thought of history, like the Imperial programme sketched by Mæcenas for Augustus in the pages of Dion Cassius; and certainly it needs a lively fancy to see positive claims to our respect in the short-sighted schemers and the soldiers of fortune who fought for the triumph of their party, though we may with Prof. Beesly marvel at the mysterious instinct of the people, the *faex Romuli*, who "steadily pushed forward to this consummation."

The chapter on the character of Tiberius raises a different set of questions, and it would be disrespectful to their author to pass lightly over the grave arguments which he has urged in favour of a conclusion which it is, however, not easy to adopt.

W. WOLFE CAPES.

Answer to the Form of Libel now before the Free Church Presbytery of Aberdeen. By W. Robertson Smith. (Edinburgh: David Douglas, 1878.)

FROM a theological, a historical, and even a literary point of view, the defence of Prof. Robertson Smith, of Aberdeen, well deserves at least a brief notice. It was in the Anglican Church that the admissibility of Biblical criticism in the modern sense of the word was first debated, but it is in the Presbyterian Church of Scotland that the question seems likely to be most thoroughly investigated. The charges brought against Prof. Smith are three in number:—(1) That he has published opinions (in the *Encyclopaedia Britannica* and elsewhere) contrary to the Scriptures and the Westminster Confession; (2) that he has published opinions "of a dangerous and unsettling tendency;" and (3) that he has published writings which, by their neutrality of attitude in regard to doctrines set forth in the Scriptures and the Confession, and by their rashness of statement in regard to the critical construction of the Scriptures, tend to disparage the divine authority and inspired character of these books. Prof. Smith denies that the two latter charges are in accordance with the constitution of his Church, and certainly the Judicial Committee of the Privy Council would not entertain them for a moment. It is evident, too, that a complete discussion of a supposed rashness of critical statement involves a detailed examination altogether inappropriate for a large and mixed judicial assembly. It is the first of the three charges which Prof. Smith deals with in this pamphlet, and his defence, which shows great literary ability, contains much to interest and instruct the student. He has shown it to be possible to maintain devoutness of spirit and a hearty acceptance of the dogmatic forms of belief with a thorough appli-

cation to the Scriptures of the ordinary methods of philological criticism. True, the Confession insists on the "infallible" truth and divine authority of the Bible, but it studiously abstains from all attempt to define the process by which the book came into its present form. The witness of the Holy Spirit, to which the Confession appeals, refers to the spiritual truths contained in the Bible. The general historical veracity of its records is not matter of divine faith, but is reached by a due use of natural means. Prof. Smith objects to the famous dictum that "Scripture contains God's Word," because "some modern writers" (and surely some old ones, e.g. Luther) "have used it in the sense that part of the Bible is the Word of God, and another part is the word of man," and prefers the expression that "Scripture records or conveys to us the infallible and authoritative Word of God." No doubt modern criticism has arrived, or is tending to arrive, at some results which would have much surprised the fathers of the Presbyterian churches, but that is simply because the origin, literary form, and literary character of the Biblical writings had not begun to be investigated in the days of the Reformation. In the text of the Bible, Calvin himself fully admits the existence of errors and inaccuracies; and if you admit error in one part of the tradition as to the Bible, why not in another, provided always that "the divine substance of the Word," its self-evidencing revelation of God and His will, remain unimpeached?

"But are there not critics?"—so Prof. Smith formulates a possible objection—"who, under form of an attempt to get a consistent view of the Old Testament literature, . . . eliminate God's revealing hand from the history altogether? No doubt there are; but they effect this, not by what lies in the critical method, . . . but by assuming an additional and wholly alien principle—by assuming that everything supernatural is necessarily unhistorical." I cannot follow Prof. Smith into all the details by which he illustrates and confirms his position. But it is worth noticing that after all that extreme criticism has said, he still maintains, with regard to Deuteronomy and Chronicles, "that it is possible by fair enquiry to gain a view of their true method and meaning which disposes of the objections that have been brought against them, and enables us to draw from them fresh instruction." "The supposition that Deuteronomy contains a fraud put forth in the name of God is as abhorrent to me as it can possibly be to the authors of the libel; the whole character of the book excludes such a hypothesis." "I believe that the internal evidence goes to show that the work is considerably older than Kuenen supposes, and really had been lost in the troubles under Manasseh."

It would be indeed a pleasure to hear that this moderate and conciliatory statement of the principles and method of Biblical criticism was deemed admissible in an office-bearer of the Free Church of Scotland. As Tholuck is reported to have said, not many years before his death, "The more liberal view [of inspiration] can be introduced without injury among the laity, only on condition that the theologians first show that they can

hold it without losing the power and purity of their religious life." It is not in Germany only that they have begun to show it.

T. K. CHEYNE.

MODERN HUNGARIAN POETRY.

Uj Nemzedék; költészete gyűjtemény, jellemzésekkel. Szerkesztette és írta Gáspár Imre. (Nagyvárad: Hügel Otto, 1877.)
Dalok az időnek. Írta Gáspár Imre. Második kiadás. (Budapest: Aigner Lajos, 1877.)

Ungarische Volkslieder. Deutsch von K. Borromäus v. Benkö. (Budapest: Hoffmann u. Molnár, 1877.)

Uj Nemzedék (New Generation) is a collection of short Hungarian poems, written by various modern authors since the year 1870. The editor, while freely admitting that such talents as those of Arany, Petöfi, and Vörösmarty (the leading Hungarian poets of the last generation) must naturally be of rare occurrence, is dissatisfied with the adverse judgment generally expressed upon the poetical powers of the rising generation. He has therefore selected numerous examples from recently published works, with the object of proving that the new generation of Hungarian poets is in no way inferior to that which preceded it; and he strongly urges that young poets, from whom the best things may be ultimately expected, should be rather encouraged to make further efforts than be disheartened by adverse and often undeserved criticisms. The editor must be commended for the care with which he has compiled a really useful and handy anthology of the most modern Hungarian poetry. The advantages of a work of this description are evident. The most recent poets in every country are not generally known to foreign readers, and translators and others have often to look in vain for some small and comprehensive work in which they may find a careful selection of the best poems, combined with a short account of each writer; and thus save themselves the laborious task of wading through the numerous poetical productions which from time to time appear, in order to ascertain what is really worthy of notice. The poems in the present collection are arranged under the name of each author alphabetically; to which is added in every case a short account of his principal works, with a notice of their literary merits defects.

Dalok az időnek (Songs for the Times) is a small volume, which has, however, reached its second edition, containing twenty-five original songs of a stirring and national character. The poet dedicates his work to the Hungarian youth, and calls upon his countrymen to fear no struggle for the good of their own home and fatherland; but he urges them no less to keep aloof from any war for the mere interests of diplomacy or of any particular dynasty.

The little volume of *Ungarische Volkslieder* is dedicated to the Kisfaludy and Petöfi Societies, and is intended to show how far the German language is available for a close rendering of Hungarian popular songs, without altering the metre. The original

text is given throughout in juxtaposition with the German translation. These little poems are of an amatory nature, and are not dissimilar in their construction to the popular Romaic songs of Christopulos.

E. D. BUTLER.

TWO PRUSSIAN KINGS.

Friedrich der Grosse. Friedrich Wilhelm der Vierte. Zwei Biographien von Leopold von Ranke. (Leipzig: Duncker & Humblot, 1878.)

(Second Notice.)

FROM the "Hermit of Potsdam" to the subject of Ranke's second memoir there is a certain descent. Friedrich Wilhelm IV. took his own measure accurately enough when he said to the Frankfurt deputation which came to offer him the German crown, "Friedrich the Great would have been your man; I am not a great Prince." But if "the Romanticist on the throne of the Caesars," as he was allusively called by Strauss (under the mask of Julian the Apostate), had not quite the character and talents which most adorn a throne, he had singular intellectual gifts, and few Germans in a private station could match his learning, artistic culture, eloquence and wit. Ranke's hesitation in dealing with a life which, it might be thought, he must be so completely competent to describe will seem very timid work to proficients in the newest historical methods, for whom probability is identical with proof. While Egyptologists and Academics expound with unerring accuracy the obscurest doings and most reserved designs of Chufu or Kudurmabuk, Ranke avows that, what with current sympathies and antipathies and the want of authentic information available as to the acts and motives of a sovereign with whom he was intimately acquainted, his materials are only sufficient for a tentative sketch. For these and other reasons the ground, no doubt, was as slippery for Ranke as the narrative of the civil wars was for Horace's friend Pollio, so that we are not surprised to find him resorting to the selective process on a scale unusual even with himself. The points specially illustrated are the king's education, and the "genesis" of the so-called "United" Landtag of 1847, a body composed of the eight provincial Diets of the kingdom. The early history of Prussia's constitutional evolution is not a very attractive topic for foreigners, and Ranke's euphemisms are sometimes misleading; but he has given an admirable picture of the king's struggle to save the realities of Personal Government by the Grace of God, and the efforts of the "limited reason of subjects" to obtain, at any rate, the measure of liberty already enjoyed for years by Saxons, Thuringians, Württembergers, and Bavarians. As a sample of Ranke's reluctance to call spades spades, we may quote his description of the king's refusal to accept the crown of the German Empire in 1849, on the invitation of the Frankfurt Parliament:—

"Herein lay a great temptation for Friedrich Wilhelm IV., for his natural ambition set towards the acquisition of power in Germany. This was balanced by a lively remembrance of the forms of

the old empire, and the consideration that the Assembly had usurped the right of electing an emperor."

He was afraid, too, that the German Constitution, of which the new dignity was to be the crown, would lead him to revolutionary roads, and for these united considerations, "with firm, free decision," he declined the offer from Frankfurt.

This makes the king a mild and timid conservative, whereas his personal remarks to the parliamentary deputation showed that his *gran rifiuto*, if partly made *per villade*, was based on devotion to the superstition of divine right. The king's words were:—

"The thing of which we are talking has no mark of the Holy Cross, does not stamp God's grace on the brow, is no crown. It is the iron collar of a servitude by which the son of twenty-four regents, Kurfürsts, and kings, the sovereign of sixteen millions of men, the master of the truest and bravest army in the world, would be made a serf of the Revolution. And be that far from me."

We have all lately read some vigorous denunciations of this king's Crimean War policy by a German Prince, who was his superior in general lights and statesmanlike insight. The Prince Consort's criticisms accurately represented our national feeling of the time, and few of us are likely to differ from them now; but the questions involved have a Prussian as well as an English side, and on this we may hear Friedrich Wilhelm's biographer with advantage, especially as he is no Russian partisan, and is capable of historic sympathies with the Turks. Writing more than twenty years after the events in question, Ranke completely endorses the neutral policy of Friedrich Wilhelm, and asserts that everyone now sees 1870 in 1854. He says of the king:—

"He could not support Russia, because her attack was wrongful; but he was still less disposed to associate himself with her opponents, because he considered their breach with Russia, at the time of its occurrence, to be unjustifiable. Far from wishing the subjugation of the Turkish Empire to Russia, a notion which he by no means ascribed to the Emperor Nicholas, he was on the Russian side in so far as the Czar was the champion of the Porte's Christian subjects, whose liberation from the pressure that burdened them the king also deemed to be absolutely necessary. . . . The king's policy arose from no sort of calculation; it was only inspired by the desire to do right according to the best of his knowledge in respect both to the European Powers and to our fellow-Christians in Turkey. Seldom has such pure and conscientious conduct produced, in the end, such immense political advantages. Prussia's persistency in the old alliance, and participation in the general movement in favour of the Christian populations, was the cause why, in the subsequent general complications, Russia opposed no resistance to Prussian warlike enterprises, when these proved to be unavoidable, neither in respect to Austria, whose departure from the old system cost her dear, nor in respect to France; and everyone now agrees that Friedrich Wilhelm's neutral policy was the source of the great successes which were afterwards obtained."

This comes to the same point as all the recent programmes of German policy delivered in the Reichstag by the highest official authority, who described with scorn the attempts to draw the king into the Western alliance of 1854, and almost spoke of the Prussian neutrality of that date as

establishing a finality from which Germany must never depart. But as we saw, deliberate calculations like those put forth in explanation of Germany's present attitude had no place in Friedrich Wilhelm's mind. Ranke says:—"Even the ablest man with the widest vision can never measure the consequences of his activity. Friedrich Wilhelm IV. had no idea of paving the way by his neutrality for the subsequent development of the Prussian power in the manner which has come to pass." If the fullness of time were come the reflection might occur that never before in history had "pure and conscientious" conduct obtained so stupendous a crown. But some pages of that future which Ranke says was hidden from his royal friend are equally dark for us. If Friedrich Wilhelm was the author of 1866 and 1870, he was surely the author of 1878. Appreciations of that sovereign's policy will be premature until mankind is better able than now to read the meaning of "the omen coming on" in Eastern Europe.

G. STRACHEY.

NEW NOVELS.

Fernvale: Some Pages of Elsie's Life. By Harry Buchanan. (London: Samuel Tinsley & Co., 1878.)

Broad Outlines of Long Years in Australia. By Mrs. Henry Jones. (London: Samuel Tinsley & Co., 1878.)

Lady Grizel. An Impression of a Momentous Epoch. By the Hon. Lewis Wingfield. In Three Volumes. (London: R. Bentley & Son, 1878.)

Fernvale is mainly taken up with the girlish pranks of the heroine, a slangy, noisy, brainless, selfish hoyden, in her school-room years; and ends with her marriage to an eligible captain a few years later, after a long illness has quieted her down a little externally, but left her as empty-headed and uninteresting as she was when in short frocks. There is a second heroine in the shape of an elder sister, who is saved by the sudden reappearance of her ne'er-do-well father from an imprudent marriage with a still less reputable suitor, one Mr. Val de Travers, whose name perhaps veils an allegory of the recently fashionable plan of asphalt-paving, now being discarded in favour of wooden blocks. The writer at the end of the volume has modestly cited Byron's line—

"A book's a book, although there's nothing in't;" but he has scarcely done himself justice, since there are some things for which a reader might have looked vainly elsewhere. Such are Elsie the heroine's full name, which is neither Alice nor Ellen, but "Elsimora," to the copyright of which Mr. Buchanan is as fairly entitled as Mrs. Kenwigs was to that of her eldest daughter's name, Morleena; the information that the well-known seaport of the Gironde is called Archachon; that a Spanish-American lady of partly Indian blood, and born in the Argentine Confederation, is a creole; that specie dollars from the same quarter (Buenos Ayres) are gold coins—which very naturally astonishes the clerks at a leading London bank, where a bag of them is emptied on the counter; that this Spanish lady calls her husband *mia cara*, while he, an accom-

plished linguist, in turn describes another lady as "Madam Virtuoso"—all which, with similar details, makes the book far more cheerful reading than its qualities as a story might lead one to expect.

Broad Outlines of Long Years in Australia does but employ the slenderest thread of story on which to string incidents and episodes of settler-life, written for the most part in a rambling, colloquial, and slipshod style, without the merit of interest or vividness in the details. It does not deserve to be classed with *George Linton*, another tale of similar character, which appeared not long ago, as a memorial of the beginnings of our colony in Natal; though, amid so many details, there are of course some which are comparatively unfamiliar, and which will, perhaps, repay search through the volume on the part of those who are making a special study of Australian subjects.

Mr. Wingfield has attempted one of the boldest and most difficult of literary tasks, that of writing an historical, as distinguished from a mere costume, novel. The time he has selected, the close of George II.'s reign and the earlier period of George III.'s, spreads over about twenty-eight years, though his story, whose chronology is rather mixed, extends a long way each side of these nominal limits, and its central motive is the story of that Elizabeth Chudleigh, Countess of Bristol and alleged Duchess of Kingston, whose conviction for bigamy before the Peers is one of the most curious pages in the scandalous records of the last century. The influence of Thackeray, even to some turns of phrase, is very noticeable in *Lady Grizel*, though there is nothing which savours of plagiarism. An *Envoi* at the close of the third volume, which might more appropriately have been a preface to the first, confesses some few of the many anachronisms and other deviations from the actual course of history which have been admitted for dramatic purposes, and deprecates adverse criticism in these respects on the ground that the author's aim has been to give a broad general notion of the time he draws, and not to put so many volumes of the *Annual Register* into action and dialogue. He is right in his main principle, though some of the liberties taken are unhelpful and superfluous, but the chief fault of the sort which a critic detects is in the version given us of the heroine's career. Mr. Wingfield has either kept too close to facts, or departed too widely from them. He was quite at liberty to make Miss Chudleigh, in real life the daughter of a moderately prosperous Devonshire squire and officer, the penniless orphan of a great peer, and to vary as he pleased the story of her double marriage, of her trial, and of her death. But having kept so exactly to history as making her maid-of-honour to the Princess of Wales, describing her as betrothed to the Duke of Hamilton, and separated from him during his tour on the Continent by the treachery of her aunt, Mrs. Hanmer—who intercepted the letters and promoted another marriage—it is an artistic mistake to bring her then into relation with an entirely fictitious set of characters; such as Captain John Bellasis (afterwards Earl Bellasis), her first hus-

band, substituted for Captain Augustus John Hervey (afterwards Earl of Bristol), and the octogenarian *roué* Duke of Tewkesbury, described, in prejudice to the Duke of Norfolk's rights, as "premier Duke of England," her second husband, in lieu of Evelyn Pierrepont, Duke of Kingston (a creation of 1715), who was a man of decent life as lives in his grade went then. We ought not to have had Hamilton and Hanmer if we have Bellasis and Tewkesbury, and conversely the historical names should have been changed if the story was to be altogether idealised and treated as affording mere suggestions, as in the case of *Woodstock*, say, among historical novels. And in some respects Mr. Wingfield has been scarcely well advised in his alterations, for the actual facts are more striking and dramatic than those he has substituted. For instance, he makes the Duke of Tewkesbury wed Lady Grizel in total ignorance of her previous marriage, and Lord Bellasis to turn up just too late from the enforced exile on foreign military service to which his angry wife's influence had condemned him for many years, whereas the truth is that Lord Bristol, having lost the one child which was borne to him by Miss Chudleigh, joined with her collusively in an ecclesiastical suit for "jactitation of marriage," wherein, by adroit suppression of evidence, a decree of nullity was publicly obtained, on the strength of which the Duke of Kingston then married her. Again, her first wedding, although private, does not appear to have been of the Fleet class; and there seems to be evidence that she got at and destroyed the entry in the parish register of Lainston which attested it. This would have given a good incident for the story, and both Mr. Wilkie Collins and Mr. J. C. Jeaffreson have shown how to use it. Thirdly, an opportunity is lost of bringing in Sam Foote, in reference to the Duchess of Kingston's quarrel with him for putting her, as Lady Kitty Crocodile, into his unacted farce, *A Trip to Calais*; and, lastly, the actual circumstances of her death were more striking than the artificial catastrophe which Mr. Wingfield has provided. Looking at his novel, however, from the point of view suggested by its secondary title, *An Impression of a Momentous Epoch*, he must be pronounced to have, on the whole, achieved a success, and to have given a very graphic sketch of the barbarism, corruption, and national degradation into which the vicious and incapable Hanoverian dynasty had plunged Great Britain by the middle of the last century. It would be wholesome reading for some of the more violent Russophobists to learn how far the England of 1770 was behind the Russia of 1878, though the latter country is in political and social development three centuries in our rear; how universal was the corruption of statesmen (a legacy from Walpole's demoralising rule); how coarsely profligate the habits of the Court and the nobility; how sanguinary and inefficient the penal code; how insecure the liberties and heavy the burdens of the subject; how effete and contemptible the Church, after half a century of Whig prelates and premiers; how spent, gone, and forgotten the prestige

which England had acquired abroad in the wars of Queen Anne. Mr. Wingfield understands quite well how nothing short of main force prevented the first two Georges from ruining England to pamper Hanover, and how the third George's stolid obstinacy and mean hate of superior minds cost Great Britain dearer than all the Stuarts could have done, had they been kept, with adequate constitutional restraints, upon the throne, while the personal grace and culture which at their worst they never lacked would have prevented the absolute savagery of manners into which society drifted under the German boors. Pitt, the Great Commoner, is boldly sketched, but not so well as Lord Bute, Wilkes, and Henry Fox. It scarcely appears that Mr. Wingfield has realised the extent, reality, and value of the services which Wilkes, charlatan as he was, rendered to constitutional freedom, or that the "general warrants," of which he made an end, and in respect of which one of the chief anachronisms in the story is committed, were the exact English correlative of the *lettres de cachet* of infamous memory. Nor is the curiously *prosaic* temper of the age quite clearly put before the reader. On the other hand, the early loves of George III. and Lady Sarah Lennox, mother of the famous Napiers—who might have been instead the mother of a George IV. and William IV.—are very cleverly told; and, indeed, so far as the dynasty is concerned, *Lady Grizel* reads in parts like the *Greville Memoirs* thrown back three quarters of a century, in just the same temper of effusive loyalty.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

In My Indian Garden. By Phil. Robinson. With a Preface by Edwin Arnold, C.S.I. (Sampson Low.) These delightful papers will be new to English readers; but though this is not mentioned in the volume before us, they created much interest in India about seven years ago, when many of them appeared in the columns of the *Allahabad Pioneer*; and the interest was increased when they were known to be by a youthful writer, a son of the well-known Rev. Julian Robinson, then the editor of that paper. They are essays in natural history, but not so much essays on natural history as on the common objects of India—birds, insects, trees, frogs, squirrels, Indian servants, the Indian seasons, and so forth. They treat unhackneyed subjects with quaint humour and with remarkable literary skill and taste. Old Isaac Walton would have enjoyed them immensely, so would White of Selborne, and even Addison would have admired them. Mr. Robinson closely observes the little objects around him, not as a scientific naturalist, though he displays scientific knowledge also, but with a sympathetic power of entering into their life and hitting it off in a happy and humorous manner with the aid of much literary culture. He does not give descriptions so much as pictures. For him, not in vain, to use his own phrase, "the great unclouded sky is terraced out with flights of birds." A dak bungalow fowl suggests curious enquiry as to what the value of life must be to it.

"Indian crows," he says, "cannot, like young sweeps, be called 'innocent blacknesses,' for their nigrity is the livery of sin, the badge of crime-life, the scarlet V on the shoulder of the convict *l'oleur*, the snow-white leprosy of Gehazi or the yellow garb of Norfolk islanders. And yet they do not wear their colour with humility or even common decency."

When lying awake in bed at night he is pleased

to think that the green parrot, which causes so much needless devastation among the fruit trees, is being garrotted by the owl. A bheesty, or water-carrier, suggests to him a seal carrying a porpoise upon its back. The industrious myna, like the Germans, is incomparable at hard unshowy work.

"Intelligence is his of a high order, for, busy as he may be, the myna descries before all others the far-away speck in the sky which will grow into a hawk, and it is from the myna's cry of alarm that the garden becomes first aware of the danger that is approaching. But wit he has none. His only way of catching a worm is to lay hold of its tail and pull it out of its hole—generally breaking it in the middle and losing the bigger half."

Some of the sketches, such as "Under the Tamarind" and "Under the Mango," are of a higher order; but all of them are fresh and bright.

IN the large collection of "Briefe und Aktenstücke zur Geschichte des sechzehnten Jahrhunderts," which Herr von Druffel is editing at Munich in the name of the Historical Commission, the events of the Smalkaldian War occupy an important place. New light is thrown upon them by the *Tagebuch des Viglius van Zwijchem*, which Herr von Druffel has just edited from the autograph in the State Archives of Brussels (Munich). Ranke had already made use of the important records of the Privy Council of Charles V., but we are only now put in full possession of them. We are moreover indebted to Druffel's book for a comprehensive introduction giving the sources of the history of the Smalkaldian War, and a commentary in which the thorough critical investigation of the minutest questions is carried almost to excess.

WITH the exception of Falconer's inimitable translations, which are only to be found in old numbers of the *Oriental Miscellany* and other defunct journals, the versions of Persian poetry which have been presented to the English reader have seldom been remarkable either for accuracy or elegance. We have just received a little book, *Flowers from the Bustân* (Thacker), containing a rendering of certain apologues from Saadi's well-known work into smooth English verse. The sense of the text is generally accurately given, but the translator has fallen into the common error of expanding the original by the use of otiose epithets to suit the exigencies of metre or rhyme. The following is a specimen:—

"The bird of fancy in its wildest flight
Hath never mounted to His godhead's height,
And subtle intellect, though it may strive,
Beyond the skirts of praise can ne'er arrive;
This maelstrom infinite devours the mind,
Like foundered ships that leave no trace behind."

The words in italics are not in the original Persian, and the word "praise" is a mistranslation by which the antithesis is lost. The literal rendering is:—

The bird of fancy flies not to the summit of His nature,
Nor does the hand of understanding reach the skirt of His attributes.
In this whirlpool thousands of ships have gone down,
So that not a plank was seen upon the shore.

The book is, however, very readable, and conveys a fairly good impression of the style of the great Persian moralist.

THE aspirant to proficiency in legerdemain was not long since obliged to content himself with such meagre instruction as was contained in the chapters on conjuring in boys' Christmas annuals. Now, however, the literature of the subject is becoming quite extensive, and various treatises exist in which the whole subject is carefully and technically explained. The last contribution to the magician's library is Mr. E. Sachs' *Sleight of Hand*, a work written by one who is obviously a proficient as well as an enthusiast in his art. It treats of drawing-room magic and

card tricks, as well as of the more imposing stage illusions; and contains, moreover, a suggestive chapter upon "spiritualistic" tricks. The explanations given are clear and concise, and are accompanied by some excellent hints on the proper *mise en scène*. We can recommend the book to all who desire to penetrate the mysteries of the conjuring art.

ERNST BERNHEIM, Privatdocent at the University of Göttingen, has published a clever little work, *Zur Geschichte des Wormser Concordates* (Göttingen: Peppmüller). By showing it to have been a compromise of the more moderate Church and political parties, he at the same time gives an internal history of this celebrated treaty, and brings forward just as convincing proof of the treaty having received many very different interpretations, and of the consistent policy of the Popes having herein been victorious over the wavering policy of the Emperors. Lastly, it appears from his researches that there were several forged records of the Concordat, which, in the disputes between Church and State concerning the application of the treaty, were used with astonishing boldness.

THE Hakluyt Society could scarcely have chosen a more interesting subject for their annual volume than the narratives of the voyages made in the latter part of Queen Elizabeth's reign which secured for the British a firm footing in India. One of the boldest seamen of that adventurous age was Sir James Lancaster, who commanded the first two expeditions to the East Indies; the narratives of his voyages, full of romantic adventure, are here reprinted from the collections of Hakluyt and Purchas, but have been largely supplemented by abstracts from manuscript journals of voyages to the East Indies preserved in the India Office, which have been reverently searched through by Mr. Clements Markham, who edits this volume. These were the days when the English East India Company achieved a great amount of Arctic work in their search for a shorter northward route to the Indies, so that the volume fitly concludes with a Narrative of the Voyage of Captain John Knight (1606) to seek the north-west passage, the precious manuscript of which was rescued from a wastepaper heap in the India Office.

MR. M. G. MULHALL, of the Buenos Ayres *Standard*, whose work on Brazil we noticed a few weeks ago, has now completed a volume on *The English in South America* (Stanford), for which his countrymen will be grateful. This chain of little biographies, collected with enthusiastic and loving diligence, takes us through the most stirring events of the political history of the continent; from the days when Cabot and Barlow first sailed up the Paraná, through the period of the Spanish Conquest when the chief British actors on the scene were explorers, buccaneers, adventurers, or eager missionaries, to the time of the Independence wars, when Ambrose O'Higgins performed those feats of valour which raised him to be Viceroy of Peru, and thence to the later period of the commercial and industrial development of the continent, in which Anglo-Saxons have played by far the most important parts. Something is told us here of not fewer than between six and seven hundred men who have been connected with some great work or enterprise that perpetuates their memory; a few portraits of leading spirits have been reproduced. The extent to which the development of the continent has been owing to British genius as shown in this work is indeed astonishing, and seems fully to warrant Mr. Mulhall's prediction that the beginning of next century will see a preponderance of English ideas on the continent, as well as the elevation of men of English descent to the highest posts in the public service.

MRS. BRASSEY'S *Voyage in the "Sunbeam," our Home on the Ocean for Eleven Months* (Long-

mans), is in every way a most charming book. It is a brightly written record of the scenes and impressions of a yacht voyage round the world, across the Atlantic to South America, through the Straits of Magellan over the Pacific, delaying here and there at one or other of its lovely islands, to Japan and China, then through the Indian Ocean by Ceylon to Aden, the Red Sea, and the canal, back by the Mediterranean to England again; and is admirably illustrated by nearly 500 beautiful engravings.

The Visible Origin of Language. (Effingham Wilson.) Philological squarers of the circle are generally more dangerous than mathematical ones, because everyone thinks he is a judge of language, while a knowledge of figures is not a universal accomplishment. The following quotation will show that the author before us is more ingenious than happy either in his verses or in his etymologies:—

"The bud, or close and opening pod,
Combines the *hat* or *hut*, and *hod*.
A *body*, too, it is, or *bust*;
The same form gives you *moss* and *must*,
Output from *moisture*, *bodies* small,
Of water-beads on ground or wall."

Three Anticyras can hardly cure a man who, after saying "that the primæval language *does exist* in the original tongue of the Old Testament Scriptures," goes on to state that he has read "Prof. Max Müller's book."

Oriental Records: Historical. By W. H. Rule, D.D. (Bagster and Sons.) This is a sequel to a volume already noticed in the *ACADEMY*. It is free from the faults and blunders that disfigured the latter, but like it is vitiated by a preconceived theory and a determination to twist everything into agreement with that theory. The book, however, will be found useful and interesting reading by those who want to know what illustrations of the Bible have been afforded by modern research. The author deals with such subjects as "The Institution of the Sabbath," "Spirit-worship," "Human Sacrifices," "The Tombs of the Kings," "The Future State," and will no doubt convey much information to the class for whose use his book is intended.

Dogs, in their Relation to the Public, Social, Sanitary, and Legal. By Gordon Stables, M.D., R.N. (Cassells.) We can cordially recommend this little book to all who take an intelligent interest in the management of their canine pets. The author, who is well known for his previous publications concerning both dogs and cats, writes with the practical good sense of a doctor, combined with the hearty enthusiasm of a naval man. His present work is admittedly occasioned by the recent hydrophobia-scare, which has somehow passed away as rapidly as it came; but his advice to the public possesses a permanent value. Among other bold suggestions, Dr. Gordon Stables recommends the licensing of dogs as beasts of draught, and vehemently attacks the modes of conveying dogs commonly adopted by the railway companies.

We have received the Library Edition of *Debrett's Peerage, Baronage, and Knightage for 1878* (Dean and Son), edited by Robert H. Mair, LL.D. "Debrett" is characterised not so much by historical or genealogical learning, as by the copious amount of information afforded concerning the living members of the titled aristocracy. To this department of his subject the editor has devoted special attention in the present issue, which is stated to be the one hundred and sixty-fifth since the first year of publication, and he has been able to add much new matter. Among other improvements, he has added short biographies of Privy Counsellors. As a record of domestic events—a sort of family Bible for the use of aristocratic circles—the value of the book is above criticism. As a work of reference to the class of literary students, its utility is not so great; but even they will not speak unkindly of the labour

involved in such an enormous collection of authentic facts. We have two small objections to bring to the notice of the editor. One is that advertisements are most inconveniently bound up between the title-page and the body of the text; the other has regard to the wildness of some of the derivations sanctioned. "The word 'sire,' usually heading letters addressed to a male sovereign, is" certainly not "derived from the Greek."

NOTES AND NEWS.

MR. TRELAWNY'S revised and enlarged book, now named *Records of Shelley, Byron, and the Author*, is likely to be issued very soon. It comes out though the publishing house of the late Mr. Pickering.

THE King of Portugal is continuing his translations from Shakspeare, and is now engaged upon *The Merchant of Venice*.

WE are sorry to hear that Prof. Clifford, in consequence of a thorough break-down in health, has again been ordered to give up work and take an immediate sea voyage as his only chance of recovery. He has accordingly started this week for Gibraltar and Malta. Happily, however, about two-thirds of his work on the *Elements of Dynamics* (announced in the ACADEMY Sept. 29, 1877) is ready for press, and will be published almost immediately by Messrs. Macmillan and Co. This portion forms a complete treatise on Kinematics.

AN illustrated edition of Mr. Francis George Heath's *Fern Paradise* will be published in a few days by Messrs. Sampson Low and Co.

MISS BETHAM-EDWARDS, the author of *Kitty*, has a new novel in the press which will possess some singularities. The scene is laid in an old French city, and the story is one which could only have suggested itself to an English resident in France under peculiar circumstances.

AT the second monthly meeting of the Library Association of the United Kingdom, a committee of eleven was appointed to report on all details relating to the compilation and publication of a general catalogue of English literature.

MISS KATE THOMPSON'S *Handbook to the Public Picture Galleries of Europe*, issued last summer by Messrs. Macmillan and Co., has been so well received that a second edition has been called for within a year of its publication. In its preparation the author has not contented herself with a simple reprint, but has embodied the results of a fresh journey undertaken during the winter to all the principal galleries of Europe. The new edition, therefore, has been thoroughly revised, enlarged, in a great part re-written, and fully brought up to date. It will be published in the course of the present month.

THE Rev. Charles Lesingham Smith, rector of Little Canfield, whose death was announced in our impression of March 9, has bequeathed to Christ's College, Cambridge, his books on mathematics, classics, and divinity, and his printed portraits of mathematicians. To the Fitzwilliam Museum he has left a portrait, dated 1657, by Samuel Cooper, and any other portraits in his possession which the trustees of the Museum may wish to have.

THE Rev. J. Laing is actively engaged in the compilation of the *Dictionary of Anonymous and Pseudonymous Literature of Great Britain*, which was commenced by the late Mr. Halkett, of the Advocates' Library. Mr. Laing proposes to complete the examination this summer of the collections of the Bodleian Library, and then to exhaust the contents of the Mendham collection at the Law Society and the library of the Athenaeum Club. When the prospectus for the publication of Mr. Halkett's materials first appeared, the

number of books which he had examined was supposed to amount to twenty thousand, but this number was considerably over-estimated. At the present time the volumes which have been collated can fall little short of that number. The labours of Mr. Laing have greatly increased the value of the work, which all bibliographers are eagerly expecting.

WE understand that a new Guide to London is in preparation by Mr. Baedeker, of Leipzig and London, and will be published before the end of the present month.

CAPTAIN G. A. RAIKES is about to publish with Messrs. R. Bentley and Son the first volume of a *History of the Honourable Artillery Company*. The work will include a History of the Ancient and Honourable Artillery Company of Boston, Mass., founded in the year 1638 by members of the H. A. C. of London.

THE Hackney Vestry, after a debate of two hours on the letter addressed to them by the Metropolitan Free Libraries Committee, have resolved by 38 to 13 that the opinion of the inhabitants be taken as to the adoption of the Public Libraries Acts. The Secretary of the Committee, Mr. E. B. Nicholson, of the London Institution, will gladly receive offers of assistance in its work.

MESSRS. GRIFFITH AND FARRAN have in the press for immediate publication a work entitled *The Crimean Campaign with the Connaught Rangers, 1854-56*, by Lieut.-Col. N. Stevens. It contains a personal narrative of events from the embarkation of the 88th Connaught Rangers in April, 1854, to their return to England in July, 1856, including the battles of Alma and Inkermann, and the miseries of the winter of 1854-5, and relating the stirring events during eleven months in the trenches before Sebastopol.

THE King's College lectures for ladies, which were inaugurated in February last at a meeting presided over by the Duke of Argyll, have been so highly appreciated in Kensington and elsewhere that the total number of entries during the present term amounts to more than 600. The various courses have included Holy Scripture and Church History; Logic and Moral Philosophy; Ancient and Modern History; Latin, English, French and German Language and Literature; and Botany. These courses will be continued after Easter, with the addition of Mathematics (Geometry, Higher Arithmetic, and Elementary Algebra), Astronomy, Experimental Physics (the theory of sound in its relation to music), Geology and Physical Geography, Greek (elementary), Latin (advanced), and Harmony. The classes will be conducted as before in the Vestry Hall, High Street, Kensington, by permission of the vestry; but it is proposed after the summer to obtain a building in the same locality, where the work may be permanently carried on and extended in many ways. The next term will commence on Monday, April 29, and end on July 25, closing with a regular examination (at which attendance is optional), and the grant of certificates to those who distinguish themselves. As the aim in these lectures and classes is to give something beyond mere popular instruction, the success already obtained is remarkable, and shows the anxiety felt for the promotion of the higher education of women.

THE *Rassegna Settimanale* announces that Messrs. Zanichelli, of Bologna, are about to publish a work by Ernesto Masi, entitled *Francesco Albergati, Commediografo del Secolo XVIII., i suoi amici ed i suoi tempi*. Among these friends were Voltaire, Goldoni, Cesarotti, Baretti, Alfieri, Monti, Benedict XIV., Stanislas Poniatowski, King of Poland, &c. The author vigorously defends Albergati from the charge of killing his wife. The period treated of in this book extends from the middle of the eighteenth century to the coming of the French.

THE voluminous work entitled *Conchologia Iconica*, commenced by the late Mr. Lovell Reeve in 1843, and continued by Mr. G. B. Sowerby, will be completed in the course of the current month, by the issue of the final part by the publishers, Messrs. L. Reeve and Co. The work thus completed will consist of twenty large quarto volumes, with upwards of 2,700 coloured plates, and comprising figures and descriptions of some 27,000 distinct species of shells.

THE Government Council of Bern has released Dr. Gottlieb Studer, at his own request, from the (Protestant) Professorship of Theology at the University. The Board of Education were charged to express the thanks of the Government to Prof. Studer for his fifty years of zealous service to the cause of education in the city and canton.

THE Government Council of Zürich has just nominated Dr. Ludwig Tobler as Professor Extraordinary of the Old German Language and Literature in the University.

To the current number of the *Archiv für Slavische Philologie* Dr. A. Kalina contributes a long article headed "Anecdota Palaeopolonica," the Russian philologist Jacob Grot a paper "Ueber die Natur einigen Laute im Russischen," Prof. Jagić an essay "Ueber einen Berührungspunkt des Altslovenischen mit dem litauischen Vocalismus," and Prof. Leskien two papers, the one on the "Svarabhaktifrage," the other on "Spuren der stammabstufenden Declination im Slavischen und Lithuanischen." Of literary interest are Dr. Const. Jireček's "Altslavische Handschriften in England," being an account of the Slav MSS. collected by the Hon. Robert Curzon, afterwards Lord Zouche; Dr. Alexander Veselovsky's distinction between the Ethiopian king Phol and the god of that name mentioned in the second Merseburg spell; and Prof. Jagić's important paper on "Die Fälschungen in der Mater Verborum des Prager Codex."

WE have received a pamphlet entitled *Indian Finance Defended* (C. Kegan Paul and Co.). The object of the author, who describes himself as an Indian officer of some experience, is to refute the prevalent opinion that India is overburdened with debt and taxation: figures, no doubt, can be made to prove anything. By treating the bulk of the debt as balanced by the fixed capital sunk in public works, and by regarding the land revenue as "rent of the national estate," it can be shown that the debt of India is not excessive, and that the Hindu taxpayer is very lightly burdened. This, however, does not touch the real difficulty—can India permanently support the cost of administration on its present extravagant scale, and is the revenue sufficiently elastic to bear any sudden strain?

MISS TURNER ANDREWS has written a work entitled *The Thoughts of Animals put into Words*, which will be published by Messrs. Griffith and Farran.

WE understand that the subscription to the fund for the testimonial to Prof. Brewer will be closed soon after Easter; and it is desirable, therefore, that any intended contributions should now be sent to the treasurer, J. W. Cunningham, Esq., secretary to King's College, the Strand, W.C. We are glad to hear that the testimonial has received cordial support, not only from members of King's College, but from historical students generally; and we trust that, with the additional contributions which may still be expected, it will be rendered worthy of Prof. Brewer's great services.

The Way of Prayer, compiled by the Rev. H. Miller, has now reached a second edition, which will be published by Messrs. Griffith and Farran, instead of by Mr. Hayes.

OBITUARY.

ON Monday, April 8, George Waring, M.A., of Trinity College, Cambridge, and Hertford College, Oxford, died. Perhaps you will allow me to give a short account of this remarkable man, with whom I was on intimate terms during his residence at Oxford. I ask it the rather because, owing to a peculiar infirmity of sight, Mr. Waring was discouraged from occupying that place in many departments of literature which his singular learning and abilities would have easily secured him under more favourable physical conditions.

Mr. Waring was the most learned man in England, probably in Europe. I give a very faint account of his acquirements when I say that it would have been very difficult to find his equal in this university either in Greek or Latin scholarship, in ancient and modern history, in general Semitic literature, in controversial theology, and in the four great modern languages—French, German, Italian, and Spanish, taken together. I do not say that Mr. Waring's knowledge of languages was philological, in the modern sense, or that he had studied the *origines* of any among those languages with the literature of which he was otherwise profoundly acquainted. But I never knew a scholar who was more intimately familiar with Greek and Latin texts and the criticisms of the last generation of scholars. He was even more exactly acquainted with the greatest works in ancient literature, and with the most eminent authors in those other languages which he read so easily. His memory in every kind of history was singularly copious and accurate, for he was never at a loss either in secular or ecclesiastical events. He was also minutely familiar with the whole range of theological controversy from the age of the earliest fathers down to the latest utterances of Teutonic criticism. I have never heard or read of any person whose learning was so vast, so varied, and so accurate. Nor have I ever known anyone who was a more fearless seeker after truth, or more resolute in maintaining his convictions. Those who might have differed greatly from the conclusions at which he arrived could not fail of wondering at his learning and of respecting his sincerity.

The charm of Mr. Waring's conversation consisted in the versatility of his knowledge and the subtlety of his humour. He could illustrate a topic better than any man I ever met, and he constantly illustrated his own inferences by the tersest epigram and the most unexpected wit. Happily his faculties were in the fullest vigour during the long period of his bodily decay. Though during the last two years of his life his physical weakness was excessive, his mind was as clear, his memory as full, his courage as high, and his conversation as excellent, as when his other powers were at their best. The only errors which he made (other than those which the peculiar infirmity of his sight made inevitable, and those which the peculiar constitution of his intellect made probable) arose from his occasional tendency toward believing ignorance to be dishonesty.

So remarkable a man should not pass away without some record. I always regretted that he took no pains to leave permanent and worthy monuments of his singular powers, as I regret that a few other learned men of my acquaintance do not. There is, in a time when knowledge is so diluted by words that many think one thought is enough for a volume, a strong inclination in different minds to become literary epicures. My friend was one of these, though I often reminded him, when he might have written his reputation on the times in which he lived,

"Paulum sepulcræ distat inertie
Celata virtus."

JAMES E. THOROLD ROGERS.

M. LOUIS DE LOMÉNIE died on April 2, aged sixty-three. He had been a member of the

French Academy since 1871, and Professor of French Literature at the Collège de France since 1845. He first brought himself into note by a series of biographical Studies, published in 1840 under the title of *Galerie des Contemporains illustres*, and signed "Un homme de Rien." He inaugurated a new *genre*—that of the biography of persons still living, seasoned with private details, with indiscretions, with malicious allusions. M. de Loménie may thus be considered as one of the inventors of "reporting." But we must do him the justice to say that he brought to this task much tact and much taste, and a brilliant vivacity which he failed to introduce into his more serious works. When he was Professor, he directed the taste which led him toward biographical studies to the literary and social history of the past. He published in 1852-3 his two volumes on *Beaumarchais et son Temps*—one of the most solid books ever written on the eighteenth century. After a pleasant study on *La Comtesse de Rochefort et ses Amis*, M. de Loménie undertook a great work on *Les Mirabeau*, the first chapter of which appeared in the *Correspondant* in 1876. It promised to be rich in new and piquant details, but has unhappily remained unfinished. As a Professor M. de Loménie does not take rank above an honourable mediocrity. He was wanting in breadth of view and in mental variety. He was before all a patient collector of facts, and knew how to arrange them with method and good taste.

THE Rev. Henry Jenkyns, D.D., Canon of Durham since 1839, died at Botley Hill, Southampton, on the 2nd inst., aged eighty-two. He graduated at Corpus Christi College, Oxford, in 1816, obtaining the distinction of a first class in classics and mathematics, and in the following year was elected to a fellowship at Oriel College. After holding several posts at Oxford, he was appointed in 1833 the Professor of Greek in the University of Durham, and in 1841 became Professor of Divinity in the same university. A collection of *The Remains of Archbishop Cranmer* (4 vols.), was edited by Dr. Jenkyns in 1833, and in 1846 there appeared a volume of the correspondence of Dr. Jenkyns with Mr. Maskell in defence of the edition against that gentleman's strictures. As the last of the canons of Durham Cathedral under the old system, he enjoyed an official income in excess of the amount considered by the present Government necessary for the support of the two new bishops of the English church.

LIEUTENANT-GENERAL HENRY GEORGE HART, the founder and editor of that useful publication, *Hart's Army List*, died at Biarritz on the 24th ult., aged sixty-nine. He entered the army in 1829. In 1856 he rigorously suppressed a mutiny of militia at Nenagh.

M. LOUIS ASSELINE died suddenly on Saturday last, aged 49. In 1860 he founded the *Libre Pensée*, and when that was suppressed, the *Pensée Nouvelle*; in 1871 he contributed to the *Radical*; and for the last few years he has been on the staff of the *Rappel*. In 1866 he published *Diderot et le XIX^e Siècle*.

MDME. LOUISE RUELENS (Caroline Gravière) died on the 20th ult., aged 57. Her first work, *Une Histoire du Pays* (republished under the title of *Sainte-Nitouche*), only appeared in 1864; and she was also the author of *Une Expérience in Anima viti*, *Choses reçues*, *Un Lendemain*, *Gentil-homme d'aujourd'hui*, *L'Enigme du docteur Burg*, *La Servante*, *Une Parisienne à Bruxelles*, *Mi-la-sol*, *Un Paradoxe*, *Vieux Bruxelles*, &c. M. Paul Lacroix is bringing out an edition of the works of M^{me}. Ruelens, of which two volumes are already published.

THE death is announced, in his 90th year, of Count Wolf Baudissin, the coadjutor of Schlegel and Tieck in their translation of Shakspeare. He also produced an excellent version of Molière. Count Baudissin was born at Rantzaun, January 30, 1789, and has lived at Dresden since 1827.

It is with regret that we have to announce the sudden death, at his lodgings, of Dr. F. Brüggemann, a naturalist who was for several years assistant to Prof. Haeckel at Jena, and who was latterly employed in cataloguing and arranging the coral collection in the British Museum. Dr. Brüggemann was author of various papers on entomology and ornithology, and more recently on corals. His loss is deeply regretted by the staff of the British Museum and naturalists generally. He was under thirty years of age at the time of his death.

NOTES OF TRAVEL.

AT a meeting of the Société Khédiviale de Géographie (Cairo), on March 22, under the presidency of his Excellency Stone Pasha, M. Brugsch-Bey read papers on the language of the Barabra or ancient Ethiopians in its relation to the language of the Egyptian hieroglyphs, and to the Coptic, Arabic, and Greek; and on the expeditions made under the direction of the Pharaohs to the valley of Hammamat (between Keneh on the Nile and Kosseir on the Red Sea), for the purpose of examining and working gold mines in that district. General Stone afterwards gave an account of recent examinations of the Hammamat valley, which have been made by order of the Khedive by Purdy Pasha and Mr. Mitchell, an American geologist. The reports of these explorers agree perfectly with the information gathered by M. Brugsch.

AN important addition to the geographical material that is being gathered by the missionaries in Madagascar is contained in an account of a journey through Tanala, Taimoro, and Taisaka (districts on the east coast between 22° and 23° S.), by Mr. James Sibree, of the London Mission. The pamphlet, which is printed at Antananarivo, is accompanied by an excellent sketch map of this previously unknown portion of the island.

THE latest intelligence from Iceland announces a fresh volcanic eruption of Mount Hecla, which began to shoot forth flames on February 27 last. It is said, also, that the village of Storuvellir has been destroyed by earthquake on the same day.

AT the Council meeting of the Geographical Society on Monday last the Royal medals for the present year were awarded as follows:—1. To Baron Ferdinand von Richthofen, President of the German Geographical Society, for his scientific explorations in China, in the course of which he mapped a great portion of the northern and central provinces, and made valuable observations on their physical geography; also for his great work on the Chinese Empire which is now in course of publication (see p. 315). 2. To Captain Henry Trotter, R.E., for his surveys in Eastern Turkestan, by which the work of the Great Trigonometrical Survey of India was connected with that of the Russian surveyors; and also for his important services in connecting his own work on the Upper Oxus with the explorations of the Mullah and Havildar further to the west, by which means he has made a most valuable contribution to the map of Central Asia. It is understood that Mr. H. M. Stanley's name would have been brought forward for one of the Royal medals, but for the fact that he has already received one in 1873 for the discovery of the late Dr. Livingstone. At the same meeting of the Council of the society Mr. Stanley was elected an honorary corresponding member.

IN December last an expedition, under the leadership of Mr. Chester and others, started from Thursday Island, Queensland, on a journey of exploration in New Guinea, and some interesting information as to their proceedings has just reached Sydney. The party went some ninety miles up the Maicussar, or Baxter River, and found a magnificent country, rich in grass, and with abundance of water. They also report that the river—which

has a deep navigable stream—has a fine entrance, and that its banks are thirty feet above high-water mark. The natives have plantations and gardens, drained by trenches, where they grow bananas, yams, coconuts, &c.; their houses are built of logs laid horizontally, and have arched roofs, made of the bark of the tea-tree. The people are described as a tall, fine race, not unlike the American Indians in general appearance, and seem to have been friendly and disposed to trade. The exploring party returned to the coast by way of the Wassicussar, which is a branch of the Baxter River, and flows into the sea some ten miles to the westward of it.

SOME news has at length been received of Mr. R. Frewen, to whose departure on an exploring expedition in South Africa an allusion was made in the ACADEMY more than a year ago. Mr. Frewen appears to have been for some time on the Zambesi, which he reached after experiencing considerable difficulty, and he has visited the Victoria Falls (locally called Mosioatunya, or "Smoke-sounding"), which he found to be 2,900 feet above the sea. In the course of eighty miles the river falls nearly 1,350 feet, almost half the total fall between the Victoria Falls and the sea. At the date of his letter Mr. Frewen proposed to remain at Waukie, or in the neighbourhood, until the present month, when the dry season will set in, and he then contemplates making a journey across the unexplored country between the Zambesi and Lake Bangweolo. Should he be successful in accomplishing this feat, Mr. Frewen will be able to claim the honour of having united the broken thread of exploration between Northern and Southern Africa.

UNDER the title of *A New Source of Revenue for India*, Mr. Strettell, an officer of the Forest Department now at home on furlough, calls attention to the resources of India as yet undeveloped for the production of fibres. For example, it appears that the desert wastes of Sindh are covered with a spontaneous growth of *Calotropis gigantea*, a shrub of the natural order *Asclepiadaceae*, which has been ascertained to yield a fibre most valuable for the manufacture of paper. At present, until the course of trade shall have worn for itself smooth channels, small parcels of the fibre can only be placed in this country at prohibitive prices. It is Mr. Strettell's aim to induce the Indian Government to undertake the initial risk and expense of promoting the cultivation and preparation of this and similar products.

MAGAZINES AND REVIEWS.

THE three most interesting articles in the *Theological Review* are placed first. Prof. R. B. Drummond gives a sketch of the Westminster Confession with reference to the subscription controversy now going on in Scotland. The Westminster Confession lends itself less to latitude of interpretation than the Thirty-Nine Articles. Not only is it more one-sided, but on that one side it is expressed with greater definiteness and precision. Beside the doctrines that are usually understood by the name of Calvinistic, the Confession teaches eternal punishment, the duty of persecution, and a rigid doctrine of inspiration. It also lays down (though this is controverted) the creation in six days, the non-salvability of the heathen, and the damnation of non-elect infants. Prof. James Drummond's *Jewish Messiah* is reviewed by Mr. Cheyne from a high standard of learning. The work is characterised as "an *Einleitung*, never careless, never absolutely meagre, and sometimes admirably complete, to the literary sources of information, followed by a kind of index, arranged under heads, of some of the most important contents." Justice is done to its very marked sobriety and impartiality. The editor contributes a graceful notice of Bishop Thirlwall, which is taken as the occasion for a survey of the present condition of the Established Church.

From some unpublished MSS. of Cudworth's, at one time ascribed to Locke, it appears that the Cambridge philosopher held the views that are now called universalism. In other respects the extracts given do not show him in a very amiable light.

In the lighter magazines this month, while there is much that is readable, there is little that is really remarkable. The *Cornhill* has an interesting page on "Hereditary Traits," not attempting to "suggest in the remotest degree any of the real difficulties of the subject," but telling the most curious stories of hereditary transmission, in the lively and fresh style which seems to be the *peculium* of this magazine. In *Macmillan* the article which will have most readers is Canon Farrar's account of Dr. Arnold, suggested by Mrs. Forster's republication of her father's sermons. There are many admirers of Dr. Farrar's writing, and to them, we suppose, this paper will give pleasure. To us, we confess, it does not, for it is a paper written by a rhetorician on a man who disliked rhetoric. Mr. Ruskin's pleasant pages of half-biography and half-autobiography ("My First Editor," *University Magazine*) derive a melancholy interest from the time of their appearance; it is to be supposed that, with the exception of the notes on his Turner drawings, they were almost the last pages that he wrote before his illness. The "first editor" is the late Mr. W. H. Harrison, a clerk in the Crown Life Office, and editor of *Friendship's Offering*, the "delicately printed, lustrously-bound" annual in which the boy John Ruskin wrote verses at fifteen. "For good thirty years" this kind friend had the revising of everything Mr. Ruskin wrote, and on that ground, if on no other, he well deserves these pages of recognition, which are to stand as preface to some "Reminiscences" of Mr. Harrison's own, to be published hereafter. As for the notes themselves, except for what they tell us of the cheerful temper and fine tact of the "first editor," and for the fresh evidence they give of that affectionateness which is the real secret of Mr. Ruskin's charm and power, they tell us little that readers of his writings did not know before. There is the usual protest, more gently expressed than usual, against the modern spirit and the modern magazine, against "the New Road, Camberwell Green," and "the condemnation of intelligent persons to a routine of clerk's work, broken only by a three-weeks' holiday in the decline of the year." There is the confession, of late too frequent, of "unconquerable listlessness," of "grumbling and moping at Venice or Lago Maggiore," while Mr. Harrison was taking his happy holiday at Broadstairs or Boxhill. "Let me not speak with disdain of either," Mr. Ruskin goes on, "no blue languor of tideless wave is worth the spray and sparkle of a South-eastern English beach, and no one will ever rightly enjoy the pines of the Wengern Alps who despises the boxes of Box Hill." As to the Reminiscences themselves, which occupied Mr. Harrison's latest years of well-won leisure, they are "valuable," says Mr. Ruskin; but

"valuable to whom, and for what? I begin to wonder. For indeed these memories are of people who have passed away like the snow in harvest; and now, with the sharp-sickle reapers of full shocks of the fattening wheat of metaphysics, and the fair novelists, Ruth-like in the fields of barley, or more mischievously coming through the rye—what will the public, so vigorously sustained by these, care to hear of the lovely writers of old days, quaint creatures that they were? Merry Miss Mitford, actually living in the country, actually walking in it, loving it, and finding history enough in the life of the butcher's boy, and romance enough in the story of the miller's daughter, to occupy all her mind with, innocent of troubles concerning the Turkish question; steady-going old Barham, confessing nobody but the Jackdaw of Rheims, and fearless alike of ritualism, Darwinism, and Dis-establishment; iridescent clearness of Thomas Hood—the wildest, deepest infinity of marvellously jestful men; manly and rational Sydney, inevitable,

infallible, inoffensively wise of wit; they are gone their way, and ours is far diverse; and they and all the less-known, yet pleasantly and brightly endowed spirits of that time, are suddenly as unintelligible to us as the Etruscans—not a feeling they had that we can share in; and these pictures of them will be to us valuable only as the sculpture under the niches far in the shade there of the old parish church, dimly vital images of inconceivable creatures whom we shall never see the like of more."

A VERY readable paper on *Church Restoration* by the Rev. George Crabbe in this month's *Fraser* puts the case of the anti-restorers as strongly and yet as temperately as can be desired. Mr. Crabbe is not a fanatic. If an anxious clergyman with antiquarian tastes were to apply to him to know what to do with a stove placed in the middle of the church and communicating with the open air by means of the east window, apparently Mr. Crabbe would not do what an eminent aesthetic firm are reported to have done, and advise the enquirer to leave "an interesting feature" alone. At least, strong as he is in his main position—that restoration as at present understood is an abomination and both has done and is doing immense harm—there is a wise tolerance about him when he comes to speak of the practical aspects and details of the matter, which will we hope win an entrance for his fundamental belief into the restoring and clerical mind. For the grievances of the anti-restorers are only too real, and reaction has not come one moment too soon. The work of the head men, the Bodleys and Gilbert Scotts of the movement, has been questionable—the quadrangle of Christchurch at this moment is enough to set many a man thinking—but what are we to say of the work of the second-rate architects and the local architects? What of "Patney Church, Wilts, a fair specimen of thirteenth-century work," reopened "after a restoration which, with the exception of the walls, the font and pulpit, and a memorial east window, has made it a practically new edifice;" or of the old church of St. Paul, Rusland, in High Furness, which, after having been taken down to the foundations, "with the exception of the tower," has been replaced by "a neat and well-proportioned building of the blue slate stone of the district," while the tower has been raised fifteen feet? Restoration has, indeed, passed like a hurricane over the land, and it is to be feared that our grandchildren may see cause to regard the activity of their ancestors with mixed feelings. Mr. Crabbe speaks only of restoration in England, but he might have strengthened his case by looking abroad. The English restorer is not alone in his crimes. In Normandy the fever which has spent its first fierceness among ourselves is at its height. The Caen churches have been restored to death, and Bayeux, still allowed to retain outside the rich weather-beaten yellow in which time has dressed its twin western towers, is as white and new inside as M. de Caumont and his friends could make it. Coutances might have been finished yesterday, and alas! for the old glass in the transepts, with the new bodies to the old heads, and all the irremediable ruin and confusion of it! The loveliest bit of decorated Romanesque in Normandy, the priory of St. Gabriel, near Creully, a year or two ago a forsaken beautiful wilderness of interlacing highly-worked arches, has been taken in hand, and by last summer the greater part of it had been re-chiselled and botched into the commonplace uniformity which delights the heart of the restorer. And now, not content with its northern spoils, the plague is passing southwards, and ominous things are being said of those wonderful ninth and tenth century churches in the Asturias, which Mr. Tozer was fortunate enough to see in the old days when few others besides Florez had wandered that way (see his papers on the Asturian churches in the *Gentleman's Magazine*, July and August, 1865). The church of San Miguel de Lino, built by Ramiro I. before 848, and now, to judge by the drawings in the *Monumentos Arquitectonicos*, one

of the most perfect of ruins, was not very long ago in danger of a "restoration" of the most terrible kind. And since 1870 the still untouched treasures of Spain have lost two lovers and champions—first, in the young poet and Romanticist, Gustavo Becquer; and now in the ripe scholar and archaeologist who died last February, Amador de los Rios.

Temple Bar contains a very long biographical article on the late Dr. Doran, from the fluent pen of "J. C. J." A paper that is, in a literary way, more notable, is Mr. Wedmore's on Cruikshank, giving us, it is true, few events wherewith to mark the artist's quiet life, but offering a more thorough estimate of his work and its qualities than has appeared before. There are enough of dates and names to allow us to distinguish the periods of Cruikshank's work, and fresh and exact accounts of some of the more memorable of his etchings—the tragic, the melodramatic, the humorous—are given for the entertainment of those whose recollections of "Miss Eske" and the "Miser's Daughter" are vague. Some sentences of the criticism hit the point very exactly, as where Mr. Wedmore says of the technical faults of Cruikshank's plates in general, "the picture had but two planes, a foreground and a distance;" and full justice is done to Cruikshank's "wide and deep understanding." It is true to say of him, as Mr. Wedmore says,

"Neither the virtues of a draughtsman trained in academies, nor those of a painter who has lived with the country in its intimate life, are perceptible in Cruikshank. But he observed men and the character of men; and what he observed and cared about in these he recorded with memory so accurate, and fingers so nimble and adroit, that one overlooks, and has a right to overlook, the lack of trained draughtsmanship. He did nothing mechanically. There are so many thoughts in each of his works, and all the thoughts are clearly expressed. That is the virtue of an artist."

Yes, and the virtue of a writer, too; and these magazines—the mass of them—are a monthly reminder that the philosopher spoke truth when he said *the way of virtue is hard*.

SELECTED BOOKS.

General Literature.

- A. LEGACY; being the Life and Remains of John Martin. Written and edited by the author of JOHN HALIFAX, GENTLEMAN. Hurst & Blackett. 21s.
DORAN, J. Memories of our Great Towns. Chatto & Windus. 12s. 6d.
EBERS, G. Aegypten in Bild u. Wort. 1. Lfg. Stuttgart: Halberger. 3 M.
MARCO-MONNIER. Le Roland de l'Arioste, raconté en vers français. Paris: Sandoz.
PEURON. L'islamisme, son institution, son influence et son avenir. Paris: Leroux. 2 fr. 50c.

History.

- BARGES, J. J. L. Recherches archéologiques sur les colonies phéniciennes établies sur le littoral de la Celtuligurie. Paris: Leroux.
BAYNE, P. Chief Actors in the Puritan Revolution. Clarke. 12s.

CORRESPONDENCE.

MR. MOFFAT v. MR. MILL AND MR. FAWCETT.

London: April 8, 1878.

Mr. Moffat complains that I quoted his disrespectful language towards Mr. Fawcett without indicating its grounds. It was needless to do so to justify what I said of its arrogance and discourtesy, but the grounds are simply that Mr. Fawcett's opinions about the advantages of peasant properties and co-operation do not meet with Mr. Moffat's approval, and accordingly he pronounces (p. 467) that they "demonstrate doubly his incapacity to comprehend the principles of political economy or of human nature." Mr. Moffat adds in his letter in the ACADEMY that Mr. Fawcett is "a political partisan," and that "he, as well as Mr. Mill, is incapacitated for dealing with political economy by the partiality of his sympathies." In short—for it comes to that—whoever differs with Mr. Moffat in either economics or politics is "incapable of comprehending the principles of political economy or of human nature," and it is not presumptuous or impertinent on Mr. Moffat's part to say so. Mr. Moffat himself is nevertheless, by his own showing, incapable of comprehending the principles at least of Mr. Mill's political economy. Let me give two out of many examples. He says (p. 468) that Mr. Mill "in his zeal for peasant proprietorship forgets his hostility to individual property." The following passage from Mr. Mill's *Principles of Political Economy*, Book v., chap. ii., sufficiently shows whether Mr. Mill had really any such hostility:—

"The objection to a graduated property-tax applies in an aggravated degree to the proposition of an exclusive tax on what is called 'realised property.' Except the proposal of applying a sponge to the national debt, no such palpable violation of common honesty has found sufficient support in this country to be regarded as within the domain of discussion. I can hardly conceive a more shameless pretension than that the major part of the property of the country—that of merchants, manufacturers, farmers, and shopkeepers—should be exempted from its share of taxation; that these classes should only begin to pay their proportion after retiring from business, and if they never retire should be excused from it altogether. . . . As land and those particular securities would thenceforth yield a smaller net income, relatively to the general interest of capital and to the profits of trade, the balance would rectify itself by a permanent depreciation of those kinds of property."

Again Mr. Moffat (p. 612) accuses Mr. Mill of "morally outrageous proposals" for the restriction of population. *Honi soit qui mal y pense*. It is not the first time that this calumny has been published, but it has not the slightest foundation, save in the morbid imagination of its authors. Mr. Moffat assures the readers of the ACADEMY that had his book been published during Mr. Mill's lifetime, "it would have contained much severer things about Mr. Mill than it does," adding that he "had also to remember that Mr. Mill has many followers and possesses much influence." I should say that some respect and consideration are due to those followers, and that the offensiveness of Mr. Moffat's language and tone is only the more reprehensible.

In a somewhat ungrammatical sentence Mr. Moffat denies that he has confounded the "orthodox" with the "historical" school of economists, save "in accusing them both of superficiality." What are Mr. Moffat's qualifications to judge? The chief writers on the historical method are Germans—especially Knies, Roscher, and Hildebrand—whose works and method were unknown in this country when Mr. Mill's treatise was written. And Mr. Moffat says of his own attainments and knowledge, in the first lines of his preface:—

"This is a work of observation and experience, not of scholarship. My other avocations have not permitted me to do more than acquaint myself with the leading writers on political economy, and those only of the English school. Of what has been done subsequently to John Stuart Mill I know very little."

I have shown that his acquaintance even with Mr. Mill's *Political Economy* is slight; but I may add for his information, since he speaks (Preface, p. v.) of the school of Malthus as the school of observation and fact, and the one to which he himself adheres, that the investigation of economic phenomena in the history and present state of mankind followed by Malthus is precisely the method followed by the historical school which the profound and erudite author of *The Economy of Consumption* condemns as superficial. No writer of the historical school, either in Germany or in England, I may add, has advocated the doctrines which my learned friend M. de Laveleye—whose name Mr. Moffat is not familiar enough with to spell correctly—bases on the history of property.

Political economy is held in general aversion, according to Mr. Moffat, as one of the most repulsive of sciences, and he holds "the common method of treatment responsible for this repugnance to a science which ought to be popular." His own method, though uncommon, is not likely to diminish the repugnance to it, but those who read Chapter i., Book vi., of his work will at least find that I did not misrepresent the author's doctrine respecting "the effects of a time-policy on the growth of population."

So far as I am concerned, the correspondence on the subject must here close, with my sincere thanks to the Editor of the ACADEMY for the opportunity of saying a word in answer to much ignorant misrepresentation of the doctrines of a philosopher for whom I retain the warmest and most grateful regard and the deepest respect.

T. E. C. LESLIE.

MUSEUMS OF CASTS.

Florence: April 6, 1878.

In the discussion which took place lately in the House of Lords on the formation of a museum of casts from antique sculpture, some of the speakers alluded to the kind of galleries in which casts ought to be exhibited. Lord Carnarvon specified a gallery 350 feet long by 40 feet wide. Experience has sufficiently proved that there can be no worse suggestion than this. The first, the most important consideration in all sculpture galleries, almost invariably overlooked by architects, ancient and modern, is so to design them that the chiaroscuro should be perfect and true, otherwise the sculpture is sacrificed. How different must the sculptures of the pediments of the Parthenon, the cornices, mouldings, capitals, and fluted shafts have appeared under the steady bright sunshine, instead of the dingy confused lights of the galleries of the British Museum. Yet there can be no doubt that a much nearer approximation can be made to sunlight than is ever attempted except in the sculptor's studio.

A long unbroken gallery would be lighted with skylights from end to end, either at intervals or in a continuous line, and the result must be the creation of cross-lights destructive to statues which are thus lighted on both sides equally. In nearly all the sculpture galleries in Europe—the Louvre, the Vatican, the Capitol, the Uffizi and others—the sculpture is for the most part very badly lighted. In these galleries we learn by the observation of the architectural arrangements what to avoid. Visitors used to crowd to the Vatican to see the statues by torchlight, in fact under admirable effects of chiaroscuro, instead of being weakened and made ineffective by cross-lights in the galleries in the daytime.

In a long gallery, besides the intolerable cross-lights, there is necessarily a great waste of wall space. Instead then of Lord Carnarvon's gallery, let us suppose eight rooms, each 40 feet square, for 40 feet square is a very good proportion, and we obtain 1,280 lineal feet of wall space, minus the doors, instead of 780 lineal feet in the gallery. Besides, the chronological series would be much better and more clearly divided. We must, how-

ever, add ten feet to the length of the building, and the thickness of the partitions also, to my computation.

Rooms 40 feet square can be lighted to perfection by one central roof-light, and the old system of placing statues on separate pedestals should be abandoned in favour of boldly designed continuous pedestals filling the entire sides of the rooms. Thus the usual gathering of dirt under separate pedestals, and the difficulties attending cleaning, would be completely obviated. The continuous pedestals might serve as presses, and their panels might be filled with casts of reliefs or ornaments from the best sources, while the statues would stand each at a proper height on its own turn-table, so constructed that each might be shown all round with trifling effort. Busts would be advantageously arranged in the same way in tiers; and above, and artistically arranged, the walls might be covered with reliefs.

Earl Cowper stated that "it was a disgrace to this country that a man who desired to be a sculptor was obliged to go abroad to study his art." If the study of the glorious sculptures in the British Museum does not train sculptors in Great Britain, we must be in a very bad way indeed. Canova thought differently from his lordship, and, when he saw the Elgin marbles, said that had he had the good fortune to see them sooner he would have formed a very different style from his own. The anticipations of speakers as to the probable effects of such collections upon artists and the improvement of art are too sanguine. We are witnesses of the prevalence of very corrupt taste in entire schools of artists, surrounded by the noblest productions of ancient and modern art. In England we have seen the most detestable so-called Gothic edifices erected close to the grandest mediæval buildings. For the formation of a great school of artists of any description we must look to other means than the formation of such museums. We want more great masters willing to teach, and we want better-educated employers of artists. Too much was said in the conversation in the House of Lords of the benefits to professional men, too little of those to other classes of society.

Artists in modern days do not always lead public taste; on the contrary, they are often influenced in the most unhappy way by the eccentricities and bad taste of employers. At the present time in Italy, the almost universal demand by rich Anglo-Saxons from both sides of the Atlantic for realistic sculpture, with imitations in the marble of embroideries, laces, buttons, fashionable costume and boots, for bouquets and statues embowered in flowers, is leading the most dexterous executants in the world—Italian sculptors—into the production of enormous quantities of corrupt and debased sculpture, only requiring colour to rival waxworks; these artists being at the same time surrounded on all sides by the noblest productions of human genius, which they affect to worship, and themselves possessed of a rare skill, which they abuse. It is the bad taste of wealthy employers which is at the root of this.

So far as museums and galleries are concerned, it may be urged that enough has been done in Great Britain for the training of artists if these be wisely used, far more indeed than at the greatest epoch of our British school. What is most wanted is a more general diffusion of taste and a knowledge of art among all classes, especially those who employ artists. Probably one of the best means of doing this would be by forming such museums in all our universities and in as many public schools as possible, with the establishment of lectures on aesthetics and on the history of art, for museums are of comparatively little use without oral instruction.

Therefore I return to my proposition, formerly brought under your notice, that besides the museums of casts advocated in the House of Lords, we must also provide moulds of selected

works, so as to furnish perfect casts to others at moderate prices. The proposed grant is more than sufficient. CHARLES HEATH WILSON.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, April 15.—4 P.M. Asiatic.
8 P.M. Society of Arts (Cantor Lecture): "Some Researches on Putrefactive Changes," by Dr. B. W. Richardson.
8 P.M. British Architects.
8 P.M. Victoria Institute: "Formation of Valleys," by G. Race.
TUESDAY, April 16.—7.45 P.M. Statistical: "Debts of sovereign and quasi-sovereign States," by Hyde Clarke.
8 P.M. Civil Engineers: Discussion on "Embankments of the Thames."
8 P.M. Colonial Institute.
8 P.M. Society of Arts (African Lecture).
8.30 P.M. Zoological: "Observations on the Uranilidae," by Prof. J. O. Westwood; "Contribution to the Ornithology of the Philippines, VIII," by the Marquis of Tweeddale; "Further Notes on the Stridulating Organ of *Palmurus vulgaris*," by T. Jeffrey Parker; "On a new Species of Finch from the Feejee Islands," by Dr. O. Finsch.
WEDNESDAY, April 17.—7 P.M. Meteorological: "Application of Harmonic Analysis to the Reduction of Meteorological Observations," by the Hon. Ralph Abercromby; "Peculiarities in the Migration of Birds in the Autumn and Winter of 1877-8," by J. Cordeaux.
8 P.M. Geological.
8 P.M. British Archaeological: "Good Friday Buns," by H. Syer Cuming; "Roman Remains at Canterbury," by J. Brent.
8 P.M. Literature: "Historical Outlines of the Buddhist Faith," by Sir Patrick Colquhoun.
THURSDAY, April 18.—7 P.M. Numismatics.

SCIENCE.

THE CAMBRIDGE PHILOLOGICAL SOCIETY.

At a recent meeting of the Cambridge Philological Society, Dr. Hayman read a paper to prove the antiquity of writing in Greece. He held that the oldest allusion to writing in Greek literature is probably the ἀρχαίη ἀκταλή of Archilochus, but the numerous fragments of Iambic and lyric poetry from 710 B.C. show that writing was already in use, and confirm the statement that literature flourished in Athens under the Peisistratidae and in Samos under Polykrates. Pherekydes of Syros and Kadmos of Miletus divide the credit of being the first prose writers. The extant plays of Aeschylus show that writing was familiar to himself and his audience (cf. *Prom. V.* 789, *Choeph.* 441-2, *Eumen.* 275, *Suppl.* 943, *Ag.* 801, *Choeph.* 699, and the mottoes on the shields of the Theban heroes). The geographical itinerary of the *Prometheus* implies a knowledge of the geography of Hekataeus and his school. The forms of the letters, again, in the earliest Greek inscriptions display a far greater resemblance to those of the Moabite Stone (B.C. 890) than do those of the Phoenician inscriptions of B.C. 400, and imply that if we could go back far enough we should find the Greek and Phoenician alphabets identical. Hence we may trust Herodotus when he says (v. 59, 60) that he saw Kadmean letters on certain tripods. Mr. Fennell replied to Dr. Hayman at a subsequent meeting of the society, and maintained that the latter had not upset the force of the arguments by which he had attempted to prove, ten years ago, that Greek prose was not written down before the Persian Wars, and Greek verse even later. Though papyrus was used in Egypt, it did not follow that it was used for writing purposes in Greece; though Sicily had a flourishing literature in Hiero's time, no papyrus was used in Italy before the time of Alexander the Great (Varro ap. Plin. N. H. xiii., 21; Lucan, iii., 222). The fact that the word *μυρογράφον* occurs on one of the inscriptions seen by Herodotus proves that they were forgeries, or that Herodotus could not read them. The passages quoted from Aeschylus do not show that writing

was used for literary purposes, while the reading in *Prom. V.* 461, is doubtful, and Dr. Hayman's translation of *Ag.* 801 is impossible. The materials of the itinerary in the *Prometheus* might have been obtained from hearing Aristæas (Herod. iv., 14) quite as well as from reading Hekataeus. At the same meeting Prof. Paley read a paper pointing out that Euripides derived his treatment of the *Helena* from the *Palinodia* of Stésichorus, who from religious scruples had represented Helen as being transported by Hermès to Egypt, while the Helen that went to Troy was only a phantom (cp. Eur. *El.* 1280-3, Plato, *Phaed.* p. 243). Of this superstition traces appear in the *εὐφημία* used everywhere to Helen in our Homer, as contrasted with the bad names given her by the tragedians. The *Helena* alludes to various non-Homeric incidents, such as the joint-kingship of Agamemnon and Menelaus at Sparta, or the birth of Helen and Klytemnestra from the egg, whereas in the *Odyssey* Menelaus is king of Lacedæmon and Helen is of Spartan birth. But the apotheosis of Menelaus is recorded in *Od.* iv., 363, and *Hel.* 1076, being one of the few points of contact between our Homeric texts and the tragedies. The *Prôteus* of the *Helena*, the Egyptian king of Herod. ii., 112, and the *Prôteus* of the satyric play of Aeschylus and of *Od.* iv. are all connected, the transformations of *Prôteus* being adapted from the older story of *Péleus* and *Thetis*—a symbolical indication of the ever-changing aspects of the sea and its isolation from the land represented by *Péleus* (ἠλός). Mr. Paley further proposed to read *καὶ νῦν* in *Suppl.* 983 (Dindorf), and *ἐξείνεν* in *Ag.* 934, where Dr. Kennedy preferred *ἐξείνεν*.

SCIENCE NOTES.

PHYSIOLOGY.

The Relative Sensibility of Different Parts of the Retina to Light and Colour.—This subject has been investigated by Landolt and Charpentier (*Comptes Rendus*, 18 Février). They find that every part of the retina is equally sensitive to white light; in other words, that the minimum degree of luminosity required to excite a sensation is the same for direct and indirect vision. It is in relation to monochromatic light that marked differences are observed. The yellow spot region is capable of recognising coloured light of a very low degree of intensity. The sensitiveness of the retina to coloured light diminishes progressively from its centre to its periphery. It is a remarkable fact, moreover, that a monochromatic impression, before it is recognised as such, appears to pass through a regular succession of phases, the first of which is always a sensation of simple luminosity; this is followed by a period of hesitation as to the quality of the colour presented to the eye, a hesitation which lasts until a sufficient increase in the intensity of the stimulus is attained. Whatever the colour employed, the same minimum degree of intensity is needed to produce the initial luminous sensation at any point of the retinal surface. Accordingly, since any stimulation of the retina, whether by white or by coloured light, is primarily followed by a simply luminous sensation, the recognition of colour always necessitating a certain augmentation of the stimulus; since, moreover, the minimum stimulus capable of giving rise to a luminous sensation is constant for the entire retina, while the minimum stimulus required to produce a colour-sensation increases from the yellow spot to the periphery; we may reasonably infer that the functions of perceiving light and recognising colour are distinct both in their intimate nature and their localisation.

A Contribution to the Physiology of the Spinal Cord.—Some years ago, the general tendency of physiological research lay in the direction of localising the spinal centres in the medulla oblongata; the cord itself being viewed as little more than a bundle of conducting fibres inter-

posed between the medulla and the spinal nerves. A most important check was given to this tendency in the year 1874 by Prof. Goltz, who succeeded in demonstrating that the movements of the bladder, rectum, and other pelvic viscera were immediately governed by centres situated in the lumbar enlargement. He pointed out that previous enquirers had been led into error by omitting to take the effect of shock into account. When the cord is divided, its lower segment remains paralysed for a considerable time after the operation; this temporary annihilation of its functions must be allowed to pass off before any trustworthy conclusions as to its functional significance can be arrived at. Further researches by Aladoff, Luchsinger, and others, have shown more and more clearly that central organs for various purposes are scattered throughout the cord, and not concentrated, as was formerly supposed, in the medulla oblongata. Luchsinger has recently published three sets of experiments bearing on this subject (*Pflüger's Archiv*, xvi., 9 and 10). The first is an application to the spinal cord of the well-known method employed by Kussmaul and Tenner in their researches on the brain. When the posterior half of the cord is suddenly deprived of blood by simultaneous occlusion of the abdominal aorta and the subclavian arteries, convulsions take place, strictly limited to the hinder part of the body. The second has to do with the vaso-motor apparatus. The rise of arterial pressure which is produced by arresting the entrance of air into the lungs is usually attributed to a stimulant effect of the non-aerated blood upon the general vaso-motor centre in the medulla. Luchsinger shows that spasmodic contraction of the arterioles may be produced by the action of venous blood on the spinal cord after its separation from the medulla, or after the functional vitality of the latter has been abolished in consequence of ligature of the vessels which supply it with blood. This experiment affords proof of the existence of independent vaso-motor centres in the cord. Lastly, it is usually taught that in picrotoxin, the active principle of the *Cocculus Indicus*, we have a poison which causes tetanic spasms by its selective action on a hypothetical "convulsion-centre" in the medulla oblongata. Luchsinger finds that it may cause convulsions in a part of the body whose innervation is derived from the spinal cord alone, and concludes that its operation is not restricted to any single "convulsion-centre," but is coextensive with the motor elements in the grey matter of the anterior horns. The general inference from all the above lines of enquiry is that the proximate centres for all the functions of the trunk are situated in the spinal cord, and not restricted to its upper, highly-specialised extremity.

The Behaviour of Asparagin in the Living Body.—It has been asserted by Hilger that succinic acid makes its appearance in the urine after asparagus has been eaten; that asparagin, accordingly, is converted into succinic acid in the system just as it is by ferments outside the body. The truth of this statement has been tested by von Longo (*Zeitschrift für physiolog. Chemie*, i. 213). He failed to discover any succinic acid in the urine after eating a pound of asparagus; neither succinic nor aspartic acid made its appearance after a dose of thirty-eight grammes of asparagin. Large doses of sodic succinate were administered to dogs; but no trace of the acid could subsequently be detected in their urine. Hence the author concludes that asparagin, aspartic acid, and succinic acid undergo complete decomposition in the body.

Splenic Fever.—At a meeting of the Paris Academy of Medicine, on February 26, M. Colin read a memoir on some points connected with the pathology of this disease, to which so much attention has recently been directed both in this country and abroad. It is pretty generally admitted that all its phenomena are due to the growth and multiplication of a specific vegetable

organism, the *Bacillus anthracis*, in the blood and tissues of the affected animal. To this view M. Colin entertains a strong objection. He believes himself to have proved that during a certain interval after the inoculation of the virus by puncture, the disease is strictly confined to the inoculated region and the lymphatic glands in immediate connexion with it; in other words, that while the tissue and juice of these glands are virulent—capable of transmitting the disease to a healthy animal—the blood, together with the spleen, liver, and other highly vascular organs, is wholly devoid of any infective properties. Further, that at this stage in the progress of the malady the lymphatic glands whose virulence may be demonstrated by inoculation, contain no trace of the specific organisms supposed to underlie the morbid process. As might have been anticipated, M. Pasteur protested in the most vigorous terms against this attempt to dissociate virulence from the presence of specific organisms. He insisted, very justly, that microscopic examination of bits of a gland, however carefully conducted, could not be held to prove the complete absence of particles so minute as bacilli or their germs. Their absence can only be established by the negative results of culture in appropriate media, a method not employed by M. Colin. After a warm discussion the questions of fact were referred to a committee.

The Hydrosphygmograph.—Under this name Mosso describes a modification of his well-known *plethysmograph*, designed to register momentary variations in the bulk of the human forearm, variations depending almost, if not quite, exclusively on alternate contraction and relaxation of the arterioles (*Comptes Rendus*, Février 25). The transition from intellectual repose to active exertion (as in attempting to solve a problem) causes instantaneous contraction of the blood-vessels in the arm, quickening of the heart's action, and increase in the volume of the brain (this was determined in three cases of accidental deficiency of part of the cranial walls). During deep sleep it was found that every stimulus—whether luminous, acoustic, or tactile—caused a very marked alteration in the character of the pulse, even when the impression on the sensorium was neither consciously perceived nor remembered. Local variations in the circulation due to cold and heat proved that dirotism and polycrotism of the pulse are phenomena of local origin depending on the relative elasticity of the vascular walls. Lastly, temporary compression of the brachial artery and the application of Esmarch's elastic bandage were shown to cause a nutritive disturbance in the walls of the vessels.

CHEMISTRY AND MINERALOGY.

The Restoration of Faded Handwriting.—In a paper on several interesting points connected with chemical technology (*Jour. prakt. Chem.*, 1878, xvii, 38), von Bibra discusses the best means of rendering legible writing which in process of time has become obscure. He refers to the custom of employing freshly-prepared ammonium hydrosulphate, which, he states, is to be applied with a brush, the excess to be removed by water, and the paper or parchment then quickly dried between folds of blotting-paper. In the case where an important document is to be deciphered we cannot help regarding this as little else than heroic treatment, and prefer to pour the reagent in a watch-glass, and hold the manuscript over it, exposing it to the fumes of the strong hydrosulphate just so long as is necessary to develop the handwriting. At best the method is not a good one, because it converts the iron of the ink into the metallic sulphide which rapidly undergoes oxidation; the writing in a very short time will fade away, as the sulphate is diffused through the moist paper, and the characters will appear blurred when any subsequent attempt is made to revive them. Von Bibra has now found in a moderately-concentrated

aqueous solution of tannin (gallotannic acid) an agent which produces the desired result, and at the same time possesses none of the disadvantages of the hydrosulphate. He applies the tannin solution with a brush, removes the excess by a current of water, and dries the document at a temperature of 50–60° R. The writing developed in this manner is clear and very black, remaining so after the lapse of several months. These methods, it need hardly be stated, refer only to manuscripts where ordinary ink has been employed, and not to documents written with Indian or carbon ink.

The Artificial Formation of Brochantite.—Meunier has formed this mineral by immersing galena in a moderately concentrated solution of copper sulphate (*Compt. rend.*, 1878, lxxxvi, 686). After the lapse of eleven months from the time when these two compounds were placed in contact, the galena was observed to be corroded to a great degree, and to be covered with a number of crystalline rosette-like clusters of bright emerald-green crystals, while a white deposit of sulphate of lead was also formed in the liquid. A chemical investigation of the green compound showed it to be a basic copper sulphate, and to exhibit all the characters of brochantite. It is not a little curious to find that Magnus, in his analysis of this mineral, detected the presence of lead oxide, while Delafosse met with brochantite in Hungary associated with galena.

Oxygenised Graphite and Platinum.—It has been observed by W. Skey (*Chemical News*, xxxvi, 60), that these two substances, after exposure to the air, acquire the property of setting free iodine from a dilute solution of potassium iodide in sulphuric acid. If the graphite and platinum be washed with a dilute solution of an alkali, or be ignited, they no longer possess this property; it is restored, however, by exposing them for a short time to the air, by bringing them in contact with nascent hydrogen, or by digesting them with dilute nitric acid. Charcoal, silver, and gold, he finds, possess the same property, but in a less marked degree. Skey is of opinion that the action is due to absorbed oxygen, and is even inclined to the belief that nitric acid, formed by the combination of this oxygen with atmospheric nitrogen, may contribute to the reaction referred to.

Separation of Nitrogen from Air.—Harcourt and Lupton have found (*Chem. Central-Blatt*, 1878, 2) that in the removal of oxygen from air by passing it over red-hot copper turnings, a very large metallic surface must be exposed, since the reaction ceases as soon as the crust of oxide obtains a certain thickness. The authors compass the difficulty by conducting the air through concentrated ammonia before it reaches the copper. The oxide is in this way continually reduced; as long as the supply of ammonia is maintained, a mixture of pure nitrogen and steam issues from the apparatus.

Composition of the Smoke of Virginia Cigars.—Schwarz has examined these gases by the aid of Orsat's apparatus, the use of which instrument he highly recommends for technical analyses. The products of the combustion of the tobacco were collected in an aspirator, and were found to contain 12.0 to 12.85 per cent. carbonic acid, and 4.0 to 4.76 per cent. of carbonic oxide. The presence of the last-mentioned constituent explains the deleterious actions of these cigars. (*Chem. Central-Blatt*, 1878, 7.)

Iodobromite.—Von Lausaulx describes under the above name a new mineral species from Dernbach, near Montabaur (*Beiblätter Ann. Physik und Chemie*, 1877, No. 12, 653). It is a silver chlorobromide, possessing the composition represented by the formula $2\text{Ag}(\text{ClBr}) + \text{AgI}$, and occurs in beautiful crystals from 1 to 2 mm. in breadth, which exhibit octahedral cleavage. This is the first occasion where these three haloid bodies have been met with together in nature in a crystalline form, and the observa-

is of interest as indicative of the dimorphism of liver iodide.

The Hydrocarbons formed by the action of Acids on Spiegeleisen.—Cloëz has examined the products resulting from the action of dilute hydrochloric acid (specific gravity = 1.12) on soft cast iron, and about 0.06 per cent. manganese. As one of the hydrocarbons enter into combination with this acid, sulphuric acid diluted with five parts its weight of water was subsequently used. In experiment 200 kilog. of iron were treated with this acid, and this quantity yielded 1.64 grammes of hydrocarbons condensed in the first washing; 2.278 grammes of brominated hydrocarbons of the ethylene series; 3.532 grammes of hydrocarbons of the marsh gas series, separated by means of sulphuric acid; 4.38 grammes of residue; and 5.408 grammes of oily liquids, removed from this insoluble portion by alcohol and subsequently precipitated by the addition of water. The hydrocarbons of the marsh gas series retained by the sulphuric acid were removed by decantation, washed with water, dried with fused potash, and, subsequently, with sodium. When submitted to fractional distillation it was found that the first portion passed at 155°, then the temperature soon rose to 160°, and remained at that point for some time. Portions which distilled between 160° and 175°, between 175° and 190°, and during successive intervals of 20° up to 300°, were collected separately. These quantities were further purified by subsequent distillation, and eventually seven products were obtained, each of which appeared to have an early constant boiling point. They are all substances which are known, and appear to be identical with bodies which have been isolated by Pelouze and Cahours from petroleum. They form the best known members of the marsh gas series, which are characterised by their insolubility in dilute sulphuric acid and by their behaviour with bromine and bromine. The first distillate is ethyl, C_2H_6 , probably identical with diamyl; it boils between 155° and 160°, has a vapour density = 5.132 (calculated = 5.001) and a specific gravity = 0.76 at 15°. Bromine water is without action on this substance; bromine, on the other hand, attacks it vigorously, as also does chlorine, forming substitution products. The next body, decyl, $C_{10}H_{22}$, boils at 178°–180°; it is a colourless, very mobile liquid, having a vapour density = 5.521, and a specific gravity = 0.769. Sulphuric acid does not act upon it; with bromine and chlorine, however, it forms substitution products. The next four are—duodecyl, $C_{12}H_{26}$, which boils at 195°–198°, has a specific gravity = 0.782, and is acted upon by bromine and chlorine; tridecyl, $C_{13}H_{28}$, boiling at 215°–220°, having a specific gravity = 0.793; tetradecyl, $C_{14}H_{30}$, with a boiling point of 234° to 238°, and a specific gravity equal to 0.812; and pentadecyl, $C_{15}H_{32}$, which boils at 258° and has a density = 0.83. The last distillate is hexadecyl, $C_{16}H_{34}$, boiling at 276°–280°; its specific gravity is 0.85. This body is attacked by fuming nitric acid, but a crystalline product was obtained. Many of the hydrocarbons, then, which are formed by the action of dilute acid on cast iron, are identical with natural products contained in the complex material which we call petroleum (*Compt. rend.*, xxv, 1003).

Accurate Chemical Investigation.—The *Journal of the Chemical Society* contains the papers which are read before the society and abstracts of chemical papers published in other journals, the abstracts forming by far the greater portion of the volume. Attention has been directed elsewhere to a recent notice in that *Journal* of a paper by E. Reichardt on "The Differences observed in Un-luterated Milk," taken from the *Archiv der Pharmacie* and appearing in the form of an abstract. After remarking on the variations in respect to specific gravity noticed in the milk of cows of different races, the writer states that two

specimens "were subjected to an accurate chemical investigation, and gave the following results:—

			Difference
Butter fat . . .	3.41	4.02	0.61
Casein . . .	2.37	3.92	1.55
Milk sugar . . .	6.13	6.60	0.47
Water . . .	88.09	85.46	—

100.00 100.00

In practice," he adds, "this difference is of some importance." What, however, is of more importance is that we are called upon to believe that all the numbers in the above columns which, carried to two places of decimals, amount when added together so exactly to 100.00 in each case, are the result of "accurate chemical investigation." Milk invariably contains inorganic substances in the form of mineral salts, which yield an "ash" when milk is evaporated to dryness and burnt, and which constitute about one per cent. of the milk. These ingredients have here been left out of consideration altogether, which is manifestly indefensible when presenting analytical results supposed to accurately represent the total composition of a substance as arrived at by analysis. Only those ingredients which have actually been quantitatively determined should be recorded in a report on an analysis, and such centesimal numbers only should be added together to form the total. The custom of winding up the results of an analysis with a picturesque 100.00 may sometimes be carried too far. A case in point which we call to mind attracted our attention about the time the paper above-mentioned appeared in the *Journal of the Chemical Society*. We read in *Nature* a description of the coal brought home by the last Arctic Expedition from Discovery Bay. The following, we were there told, "is the result of several analyses" of this coal:—

Specific gravity . . .	1.29
Moisture . . .	2.33
Ash . . .	6.21
Sulphur . . .	0.96
Carbon . . .	76.95
Hydrogen . . .	5.43
Oxygen } by difference . . .	6.78
Nitrogen }	
	100.00

Perhaps we are dense, very dense; but we never before attached so much weight to the specific gravity of coal.

THE German Federal Council issued, at the end of last year, a list of contractions which are to be employed in official documents to indicate the respective weights and measures, the names whereof are written beside them in the following table:—

Kilometer . . .	km	Cubic meter . . .	cbm
Meter . . .	m	Hectoliter . . .	hl
Centimeter . . .	cm	Liter . . .	l
Millimeter . . .	mm	Cubic centimeter . . .	ccm
Square kilometer . . .	qkm	Cubic millimeter . . .	cmm
Hectar . . .	ha	Ton . . .	t
Ar . . .	a	Kilogramm . . .	kg
Square meter . . .	qm	Gramm . . .	g
Square centimeter . . .	qcm	Milligram . . .	mg
Square millimeter . . .	qmm		

No stops are to follow the letters. The letters are to be placed after the figures which express the amount, not over the decimal point: 5,37m, not 5m,37cm. In separating the integral numbers from those representing the decimal part a comma is to be employed in place of a full stop. The comma is not to be otherwise used when writing numbers representing measures of weight or capacity, not as formerly to divide high integral numbers; in such cases the digits are to be divided into groups of three, counting from the comma (our decimal point), and the division between the groups is to be marked by space. The new system has been introduced in the *Chemisches Central-Blatt*. (See note in *Chem. Central-Blatt*, January 2, 1878, 16.)

THE University of Pavia has announced that on the 28th of the present month the statue erected to Volta will be unveiled.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY.—(Thursday, March 21.)

W. CARRUTHERS, Esq., F.R.S., V.-P., in the Chair.—Mr. G. T. Saul exhibited an example of the enormous development of adventitious roots from a species of *Berberis*.—On behalf of Mr. J. Willis Clark, of Cambridge, there were exhibited mounted specimens of the male, female, and young of Fur-bearing Seal of the North Pacific. Mention was made of the "rookeries" of these creatures, containing over three million seals in a compact area. Like old Turks, a male dominates over a harem of a dozen or fifteen females, which he guards with jealous care, for two months or more never stirring from the spot, and meantime fights terrific battles for its maintenance. A neutral zone exists to the rear of the breeding grounds, where the enforced bachelors and adolescent young of both sexes repair. These come and go continuously, passing to and fro through free lanes of passage. Others of these animals delight in dashing among the breakers on the surf, or in droves frolic and play on the sand and grassy dunes adjoining the more rocky ground of the "rookery." The method of shaving the fleshy side of the skin, thus cutting loose the roots of the long coarse hairs, and retaining the superficial fine fur of commerce, was explained, as also other interesting points in the economy and natural history of the Otaries.—The Secretary read the gist of a paper "On the Venation of the leaf of Hemlock (*Conium maculatum*)," by Mr. T. Gorham. The author maintained that in a piece one-third of an inch long by one-fifth of an inch wide, by registration of the veinlets in a tabular form and constructing these in figure, an exact counterpart of the venation of the entire leaf results. He farther believed that comparisons of leaves of different umbelliferous genera prove that each can be detected and recognised from the merest fragment.—A communication was made by Mr. B. Clarke on "A New Arrangement of the Classes of Zoology," founded on the position of the oviducts, or, where these are absent, on the position of the ovaries, including a new mode of arranging the mammalia.—A notice in abstract was given of "Some Genera of the Olacaceae" by Mr. J. Miers. He describes a new genus, *Rhaptarrhena*, from Brazil, allied to *Aptandra*; also three other genera *Myoschilos*, *Arjona*, and *Quinchamalium*, which possess a distinct though small calyx and separate calycle.—The Rev. M. J. Berkeley and Mr. C. E. Broome gave a list of Fungi from Brisbane, Queensland. Among these, *Agarics*, *Clavarias*, and fleshy fungi are scarce, interesting forms of *Polyporus* obtain, while leaf-parasites are poorly represented. Some species are identical with Ceylon and South American kinds, and several are common to Europe.

PHYSICAL SOCIETY.—(Saturday, March 30.)

PROF. W. G. ADAMS, President, in the Chair.—Mr. W. H. Preece described Byrne's Pneumatic Battery, and exhibited some of the results that may be obtained by its means. It is specially devised with a view to provide the medical profession with a portable battery capable of producing a considerable amount of heat, such as is required for cauterising operations. The negative plate consists of a very thin plate of platinum, to which a lead backing is soldered, and this is covered with a sheet of thick copper also coated with lead, the whole being then covered with a non-conducting varnish, with the exception of the exposed platinum face; such an arrangement is found to be advantageous in that it increases the conductivity of the negative plate. Two of these plates are arranged to face the zinc plate, and the exciting liquid consists of 12 oz. of bichromate of potash, one pint of sulphuric acid, and five pints of water. A fine tube dips into the exciting liquid, and is so arranged that it conducts a current of air against the face of the negative plate; by this means the current obtained from a given electromotive force is materially augmented. Mr. Preece then described a series of experiments he has made with a view to ascertain the cause of the great heating and illuminating effects that could be obtained with the apparatus exhibited, and he showed that the effects were due to the mechanical agitation of the liquid on the face of the negative plate. By means of a small battery of four cells, in which the plates were 4 in. by 2 in., a length of 6 in. of platinum wire No. 18 (0.05 in.) could be heated to bright redness; and much more powerful effects were obtained by a large battery of

ten cells made by Ladd. In this case about 2 ft. of a No. 14 (0.089 in.) wire were heated, and it was shown that when connected with an 18-inch inductorium, kindly lent by Mr. Spottiswoode, sparks of over 17 in. could be obtained.—Mr. Preece then exhibited an ingenious method of showing the vibrations of a telephone-plate to an audience, which has been devised by Mr. H. Edmunds. A vibrating-plate is employed to break contact, as in Reiss's original telephone, and is introduced into the primary circuit of a small induction coil. The induced current is employed to illuminate a rapidly-rotating Gassiot's tube, and on making and breaking contact by speaking into the resonator, an illuminated star is observed, the number of whose arms varies with the pitch of the note.—Lord Rayleigh exhibited and explained an arrangement which he has employed with advantage in certain acoustical experiments, in order to secure absolute uniformity in the rate of rotation of an axle. The axle whose motion it is required to maintain uniform is usually driven, at an approximately uniform rate, by any convenient means. At equal distances round the axle are arranged four soft iron armatures which successively come in front of the poles of a horse-shoe electromagnet placed in the circuit of a four-cell Grove's battery. The current is rendered intermittent by the following arrangement:—Passing into the body of a tuning-fork vibrating about forty times per second, it leaves by a small platinum stud, which is touched at each vibration of the fork; the current then traverses a second small electromagnet between the prongs, and by this means the vibrations are maintained: passing to the magnet above referred to, the current then returns to the battery. The velocity of the axle is such that it performs about one complete revolution for every four vibrations of the fork, and the exact adjustment is effected as follows:—If the driving power be just sufficient to produce the desired speed, the armatures will be so attracted by the magnet as to be exactly opposite to it at the middle of its period of magnetisation, and so long as this position is maintained the magnet will not (on the whole) affect it. But if a disturbance occur in the driving power the armature will be displaced from its former position and will be attracted by the magnet until the error is compensated. Besides the armatures, this axle also carries, concentric with it, a hollow metallic ring filled with water, and as this possesses a certain momentum in virtue of its rotation, it will act as a drag tending to check the velocity in case it increases and in the converse manner when a diminution occurs. A blackened disc perforated with rings of holes of various numbers also rotates with the axle, and by placing the eye behind the ring of four holes and observing a prong of the fork it is easy to ascertain whether the uniformity is maintained, since in that case the prong will appear to remain stationary.

MUSICAL ASSOCIATION.—(Monday, April 1.)

MR. STEPHENS in the Chair. Mr. A. Hill's paper on "A Suggested Improvement of the existing Staff Notation for Vocal Music" was read by the secretary. The existing key is indicated by the mode of writing the bars, so that the indication is constantly repeated; signatures are dispensed with.—Mr. Bullen then read a paper on "The Galin-Paris-Chevé Method of Teaching considered as a Basis of Musical Education." The method was expounded in outline, and passages from the diagrams exhibited were vocalised by a pupil. The basis of the notation is the representation of the notes of the major scale by the first seven digits. The singing of all intervals is based ultimately on the scale and the tonic chord, which are first taught. Any note belonging to these forms a *point d'appui*, which may be used mentally to pass to any note standing in a simple relation to the *point d'appui*. The claim of those who teach the system is that it is not based on the instrument, and requires nothing of the pupil but what he can evolve himself at home from the scale and tonic chord when he once knows them. It is said that in from nine months to a year the pupil acquires the power of reading perfectly. Mr. Curwen, junior, said that the principles of the system were analogous in many respects to those of the Tonic Sol-fa system; but the development has taken place independently in the two cases. The Chairman, Mr. Cummings, Mr. Ellis, and others took part in the discussion; and there appeared to be

a strong feeling as to the interest and importance of the method.

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, April 2.)

PROF. NEWTON, F.R.S., V.-P., in the Chair.—The Secretary read a report on the additions that had been made to the Society's Menagerie during the month of March.—A communication was read from the Marquis of Tweeddale, containing the seventh of his contributions to the ornithology of the Philippines. The present paper gave an account of the collection made by Mr. A. H. Everett in the Island of Panaon.—Mr. A. G. Butler read descriptions of new Lepidoptera of the group Bombycites in the collection of the British Museum.—Communications were read from M. E. Oustalet, containing the description of a new species of Cassowary, from New Guinea, proposed to be called *Casuarus Edwardsi*; and from Mr. F. Nicholson, containing the description of an apparently new species of American Pipit from Peru, which he proposed to call *Anthus peruvianus*.—Prof. A. H. Garrod read some notes on the placentation of *Hyomoschus aquaticus* as observed in the pregnant uterus of a fresh specimen of this animal recently examined.

SOCIETY OF BIBLICAL ARCHAEOLOGY.—(Tuesday, April 2.)

S. BIRCH, Esq., LL.D., F.S.A., President, in the Chair. The following papers were read:—"Memoir of the late H. Fox Talbot, F.R.S.," by R. Cull.—"On the Names of Brass and Copper in the Cuneiform Languages of Chaldea and Assyria," by François Lenormant. This paper consisted of an extensive and exhaustive collection of extracts from the cuneiform inscriptions, citing the passages in which the different names of the metals occur, and illustrating their application by examples from bilingual hymns, &c. To these were added a widely-gathered series of philological parallels, and many valuable notes on Assyrian and Accadian, and numerous references to the Semitic languages, the whole given in the manner for which the distinguished Assyriologist is so well known.—"Translation of an Egyptian Contract of Marriage," by Eugène Revillout. This interesting contract of marriage is written in the demotic character upon a small sheet of papyrus, No. 2432, Cat. Egyptian, Musée du Louvre. It is dated in the month of Xoudx, year 33 of Ptolemy Philadelphus, and the contracting parties are Patma, son of Pehelkhons, and the lady, Tg-outem, the daughter of Rehu. The terms of the deed are extremely singular as to the amount of dowry required on both sides, together with the clauses providing for repudiation. After the actual dowry is recited, the rights of the children which may hereafter come from the marriage, as well as the payment of the mother's pin-money, are secured by the following clause: "Thy pocket money for one year is besides thy toilet money which I give thee each year, and it is thy right to exact the payment of thy toilet money, and thy pocket money, which are to be placed to my account, which I give thee. Thy eldest son, my eldest son, shall be the heir of all my property, present and future. I will establish thee as wife."—"On an Inscription of Psametik II. in the Museum at Palermo," by Miss Gertrude Austin. This inscription, which is unfortunately only a fragment, is engraved on the upper part of a sitting statue of Psametik II., and the characters are of extremely fine workmanship. The purport of the inscription is to record a proseynema to the four divine rams of Mendes, who are invoked to bestow prosperity upon the king of Upper and Lower Egypt, Psametik Uah-ab-ra.

ROYAL SOCIETY.—(Thursday, April 4.)

SIR JOSEPH HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On the Development of the Parasitic Isopoda," by J. F. Bullar; "On the Determination of the Constants of the Cup Anemometer by experiments with a whirling machine," by the Rev. Dr. Robinson; "On the Action of Ozone on Nuclei," by C. Tomlinson; "Notes on Physical Geology, IV.," by the Rev. Dr. Haughton.

SOCIETY OF ANTIQUARIES.—(Thursday, April 4.)

F. OUVRY, Esq., President, in the Chair. Mr. C. S. Percival continued his account of the collection of

documents belonging to Sir John Lawson of Burgh. Among the signatures, the most noteworthy were three documents bearing the signature of Richard III. when Duke of Gloucester, who engaged William de Burgh as his retainer, paying him a yearly fee and sharing his winnings in war; a marriage dispensation granted by Cardinal Pole; and two documents bearing the sign-manual of Charles I. and James II. Among the seals are specimens of the seal of Mount-grace Priory, the Common Pleas seal of the Long Parliament, and the first Great Seal of James I. The collection also contains the contract for the building of Catterick Bridge over the Swale in 1422, which is referred to, but not printed at length, in Clarkson's *History of Richmond*.—The Rev. Canon Greenwell exhibited the portable altar of St. Cuthbert, made of wood inlaid with silver.—Mr. Peck, the local secretary for Sussex, exhibited a small bronze figure from a crucifix which was found in Combe Church, near Lancing. The figure wears a crown and was originally gilded.

CHEMICAL SOCIETY.—(Thursday, April 4.)

DR. GLADSTONE, President, in the Chair. A lecture "On the Application of the Microscope to some special Branches of Chemistry" was delivered by Mr. H. C. Sorby, F.R.S. The lecturer confined his discourse to the application of the microscope for determining the refractive indices of liquids and solids. If an object be placed on the stage of a microscope, and the focus be adjusted accurately, on placing over the object a plate of some refracting substance, the object will be invisible; to bring it again into focus the body of the microscope must be moved further out. If this distance be d , and the thickness of the plate be T , then the index of refraction = $\frac{T}{T-d}$. This distance can be measured either by a scale and vernier attached to the body of the microscope, or by graduating the head of the screw which works the fine adjustment. The lecturer then described the various methods by which the two quantities, T and d , could be practically measured to $\frac{1}{1000}$ th of an inch; the curious and diversified images seen by observing with a microscope a circle or a grating through transparent plates of various substances were then explained. Minerals having no double refraction are unifocal, i.e., both systems of lines in a grating can be seen at the same focus. Minerals having double refraction are bifocal, i.e., only one system of lines can be seen at one focus, a new focus having to be found in order to see the lines at right angles to the first set. This method has enabled the author to identify various minerals in sections $\frac{1}{500}$ th inch thick and $\frac{1}{100}$ th inch in diameter. Thus in a dolomite $\frac{1}{400}$ th inch thick, a zeolite, labradorite, calcite, and augite were identified with almost absolute certainty. In sections of shells $\frac{1}{1000}$ th of an inch thick, calcite can be easily distinguished from aragonite. In conclusion, the lecturer referred to the connexion between the indices of refraction and chemical composition. The data are defective at present, but several points have already been made out. Thus of two minerals having similar compositions, but one containing calcium and the other one of the alkalis, the first has a higher index of refraction. A lime garnet on the other hand has a lower index than a precious garnet which contains iron instead of calcium.

LINNEAN SOCIETY.—(Thursday, April 4.)

W. CARRUTHERS, Esq., V.-P., in the Chair. There was exhibited by Dr. H. Trimen the base of the stem of the Water-Hemlock (*Cicuta virosa*, Linn.) in its floating winter state, obtained near Yarmouth. This was well figured in the *Phil. Trans.* last century, but has seldom been referred to since by botanists.—Mr. G. Murray showed under the microscope specimens of growing Saprolegnia, exhibiting terminal and interstitial oogonia.—A paper on "Some Minute Hymenopterous Insects," by Prof. J. O. Westwood, was in his absence read by Mr. M'Lachlan. This contains descriptions of the following new forms:—*Mymar Taprobanicus*, *M. Wollastoni*, *Alaptus excisus*, *Oligosita subfasciata*, *O. Stanforthii*, *O. nodicornis*, and *Trichogramma erosicornis*; all singular insects, alike interesting structurally and as regards habits, &c. A short notice was read by Mr. M. C. Cooke on a collection of Fungi from Texas, made by Mr. Ravenel. Adding all other recorded species, the series shows that much yet remains unknown in the mycologic

flora of what probably is one of the richest States of the Union.—The Secretary read some "Remarks on the peculiar Properties ascribed to a Fungus by the Samoans," by the Rev. Thos. Powell. The natives name the fungus "Limamea," specimens of which have been forwarded to the Rev. Mr. Berkeley for identification. It destroys their bread-fruit trees and the chestnut (*Inocarpus edulis*). An antidote to its ravages is said to exist in the liliaceous plant *Crinum asiaticum*, which the natives grow between the trees liable to be affected.

PHILOLOGICAL SOCIETY.—(Friday, April 5.)

Dr. J. A. H. MURRAY, V.-P., in the Chair. Mr. Urwick and Mr. Bollinger were elected members. A paper by Mr. H. Sweet, President, on "Gender in the Teutonic Languages," was read by Mr. Nicol. Four kinds of gender were distinguished. (1) *Absence of gender*, except in the specific words "man," "woman," &c. (2) *Natural gender*, as in English, where male and female beings are respectively masculine and feminine, and inanimate things are neuter; other distinctions being also possible, such as the twofold one of rational and irrational. (3) *Metaphorical gender*, by which inanimate things are regarded as male or female according to some fancied analogy. (4) *Grammatical gender*, by which things (and occasionally human beings) may be either masculine, feminine, or neuter, without regard to their meaning. The processes by which grammatical gender has been simplified or lost in the modern Teutonic languages were then examined, and some cases of the development of an independent metaphorical gender were pointed out.—Mr. A. J. Ellis stated the results of his trial of the phonograph with Prof. Bell. He found that it could not at present be trusted to register properly all the variations of sound of the human voice. In reproducing *s, o, e*, it specially failed.—Messrs. E. L. Brandreth and R. N. Cust were appointed the delegates of the Society to the Congress of Orientalists at Florence in September next.

LIBRARY ASSOCIATION.—(Friday, April 5.)

W. H. OVERALL, Esq., F.S.A., in the Chair. On the motion of Mr. E. B. Nicholson (for Mr. H. R. Tedder), a special committee was appointed to consider and report upon all details relating to the compilation and publication of a general catalogue of English literature; the committee to consist of Messrs. Bullen, Ashton Cross, Harrison, Nicholson, Overall, Tedder, Ernest C. Thomas, Vaux, Walford, B. R. Wheatley, and H. B. Wheatley, with power to add to their number. Mr. Nicholson exhibited and explained a specimen of the Bonnange card-catalogue imported by Mr. Trübner.

FINE ART.

THE ARCHAEOLOGICAL EXPLORATIONS OF THE TIBER BED.

LATELY the great project of archaeological excavations in the bed of the Tiber has been revived, after having been abandoned for a long while. This is not a new subject for English archaeologists, and in treating it I shall not dwell on details already known.

In 1870, a little after the entry of the Italians into Rome, the waters of the Tiber filled the principal streets of the city. Among the many letters accompanying offers of assistance to the committee which had been formed by the advocate Placidi, one attracted much attention, and was republished in several journals. The writer of it was Signor Alessandro Castellani, whose name is well known in England. He sent his offering from Naples—a city which received him cordially in the last years of his exile. He said he hoped this would be the last time the Tiber would be permitted to sweep in over Rome, and that the day had now come to demand a strict account of the ancient injuries done by the river to the city, and to oblige it to restore all the treasures which in the course of ages it had swallowed up. The inundation had shown to the Italian Government, at the very moment of its first setting foot in Rome, what one of its first duties in protecting the capital of the

kingdom was. But before the dredging and other necessary operations were taken in hand, an archaeological examination of the bed of the river should be made.

As is always the case when fresh ideas are started, many saw in the project an old Utopian one, and told of a famous Cardinal who not long ago used all his influence to have excavations made in the Tiber, but his plans were not favourably received; these opponents, however, were silenced when they heard that the letter of Castellani was much praised by the most learned archaeologists of Europe.

However, it was not enough for the undertaking that its scientific utility should be made clear; it was necessary to provide the needful means for its success, in order that when it was submitted to the Government it should present such a case as would urge them to accept it. Signor Castellani having referred the matter to the Messrs. Lucas, whose various machines for dredging the Thames had been so successful, was informed by them that the same method employed on the Thames would also suit the Tiber. With the sympathy for Italian affairs common to all Englishmen, the Messrs. Lucas added that they would be pleased to place their machine at the disposal of the Tiber excavations, and associate their name with this very noble work.

I remember among other things for which I am indebted to the kind courtesy of the same Signor Castellani one that merits notice. Baron Rothschild, of Paris, expressed himself ready to advance the necessary means to conduct this undertaking to a termination whenever it could assume a private character. But Signor Castellani saw that it would be highly indecorous for the Italian Government to leave to others the initiative of an affair in which the pride of the nation was involved.

As Castellani did not wish to be alone in a matter of such importance, he consulted, when he returned to Rome, six distinguished men—Profs. Helbig and Lignana, Prince Odescalchi, Senator Vitelleschi, the sculptor Story, and the engineer Giordano; he explained to them the facts, demonstrated that the undertaking was sure of the support of archaeologists, engineers, and bankers of the highest importance, and begged them to unite with him in a committee, the work of which should be to push forward this great enterprise. These gentlemen most willingly consented, and appealed both to the municipality and to the Government, reminding them of the opportunity they had of regulating the archaeological exploration of the Tiber bed in connexion with the necessary works that would be made at the expense of the State to preserve Rome from inundations.

All this happened in 1872, and although the municipality of Rome, presided over at that time by Count Pianciani, promised to further the scheme to the best of its ability, since that time not a word has been said of the archaeological excavations and the Tiber works.

When General Garibaldi established himself in Rome to propose to the Chamber of Deputies his grand project for the diversion of the Tiber, he declared that he intended to make the works useful both for hygienic and archaeological purposes. The time seemed to have come at last when the excavations could begin; but then also hope was deceived. The Chamber, after having declared in 1875 all the works necessary to preserve the city of Rome from serious inundations of the Tiber of public utility, ordered preparatory studies for the execution of the grand work, and the result of these studies was the law of June 30, 1876, regarding the first series of works, which were to consist of widening the bed, of embankment walls where they were needed, of removal of ruins, of clearing-out and regulating the river-bed, of works relative to the improvement of the bridges where they were most urgent, and establishing a channel on the left side.

I do not know how it happened that there was

no one in the Chamber to protect archaeological interests. When the law was passed, Signor Castellani was in America, at the great International Exhibition, the Chamber was on the eve of vacation, fatigued with the labours of the Session, and Castellani's friends, who had promised their strongest support as regards the excavations of the Tiber, were absent.

The project of exploring the bed of the river was completely abandoned, and in March, 1877, operations were begun by removing some ruins, as had been authorised by the law.

Then, as was natural, the Ministry of Public Instruction protested, and insisted that the demolition should be at once suspended, although it was well known that the walls which were destroyed were of no importance, as they belonged to some old water-mills; but orders were given that not a stone should be touched without the advice of a commission composed of eminent archaeologists. The Minister of Public Instruction was perfectly right, however, for he proved by this action that, though the demolition of the ruins might be in accordance with the law, it was not to be supposed that the intention of the legislature was to condemn to destruction the testimonies of ancient greatness. This prohibition, however, provided only for the preservation of the ruins of buildings outside the bed of the river; the question of the antiquities lying in the bed of the river remained always untouched.

When Commendatore Coppino, Minister of Public Instruction, was informed by Senator Fiorelli of the question recently agitated, he lost no time in consulting his colleagues, the Ministers of Public Works and the Marine, to know whether with the means put at their disposal by the State it would be possible to make an experimental excavation; but neither was this good intention crowned with success. They had to wait until the hydrometric condition of the river would allow the towing of the machine which was said to have been employed with success in the works of the port of Spezia; but, whether through the slowness of the proceedings of the river works, or because of the difficulties met with by the Minister of Public Works, the attempt failed. Signor Castellani did not lose courage. After the late Ministerial crisis, and the appointment of a new Ministry, Castellani had recourse to Crispi and Perez; he told them that without the support of the whole Ministerial Council the efforts of the Minister of Public Instruction would be of no avail. In this way I hope the question will be finally settled by the Government.

Perhaps if an agreement could be arrived at between the different branches of the public administration, some use might be made of the iron tubes intended to support the new bridge now building at the Porto di Ripetta; by means of these some experimental excavations could be made which would give an idea at least of what the cost would be of examining the whole bed of the river in its course through the city. It will be seen that this is a truly colossal undertaking, and we cannot hope to see it completed with small means; on the other hand, it is evident to everyone that the Government, having decided to disturb the bed of the river, is now bound to take measures for its archaeological examination.

Among other things proposed to the Ministry I have heard it reported that a private society has offered to pay in advance the sum required for these excavations, on condition of taking possession of all objects that do not relate to art or history, and of depositing all the objects of historic or artistic value in a Tiberino Museum. The Government itself would own this museum on the condition that it should give to the society the profits of the entrance fee for as many years as

* Since this letter was written, a royal decree has been issued nominating a commission for the purpose of superintending the proposed researches in the bed of the Tiber.

would be required to reimburse the society for the money advanced. There is no doubt that such propositions may serve to encourage attempts to perform this work. I really do not know whether the Tiber bed may be of bronze, as the Roman people say. I have talked myself with persons very learned in the mediæval history of the city who have assured me that the Tiber excavations would be profitable, because of the many traditions of objects thrown into the river, and, above all, that wherever excavations have been made they have never failed to yield monuments of value.

I therefore hope that the experiment may soon be made, and that the Ministry, having associated its name with so grand a design, may not be obliged afterwards to repeat in its defence the words with which Prof. Max Müller closed one of his letters to Prof. de Gubernatis: "If we are *désillusionnés*, never mind; a *désillusionnement* is often as useful as a revelation."

F. BARNABEI.

THE NOVAR PICTURES.

No moment could have been better timed for the interest of the inspection of the Novar Turners than one at which it was still possible to compare that collection, so far as its drawings are concerned, with the Turner drawings in the collection of Mr. Ruskin, still exhibiting in Bond Street. As regards the paintings, if it has been remarked that no prices like the prices of Saturday had ever before been reached by work of Turner's, it should also be remembered that never before has such work of Turner's in oil painting been offered to the competition of amateurs. The pictures were, as a series, the most magnificent and the most interesting examples of our greatest master ever seen or likely to be seen in an auction room. Nay, more—the collections, public or private, which contain the like of them, are but two or three at the most. The drawings formed a brilliant series—of rare occurrence even in sale rooms where the very finest things of art are wont to be gathered and dispersed—but they did not form, we think, a treasure in quality so unique or peculiar.

A collection in which the earlier work of Turner is wholly wanting, however rich it may be and numerous, lacks a particular charm of artistic interest. No array of the splendid achievements of Turner's later art can make amends for the absence, not indeed of the very early, precise, or tentative work, but of the sober and happy work of Turner's first years of foreign travel—work employing still somewhat limited means, but with a calm and steady and economical command of those means, an unparaded mastery, a powerful restraint of power. In work of this period, and in examples of the very happiest exercise of Turner's art in this period, Mr. Ruskin's collection is exceptionally rich. The Grenoble series, studies very much of morning light, in quiet greys and tones of the calmest, has the influence of almost the very scenery itself "to quiet and retrieve;" and there is some absence of refreshment in the long survey of an assemblage of wholly later work—such as that exhibited at Christie's last week, chosen though it had been with all the advantages that belonged to the position of the collector, Mr. Munro. But even as a whole—and not to speak for the moment of certain examples lifted above the rest—even as a whole the collection of drawings was of a kind to impress the public very strongly. All, or nearly all, were in the finest condition—like Mr. Ruskin's own, and like some few others that have never been passed from hand to hand under the hammer; and all, or nearly all, had for the public the obvious intelligibility of finished work—sometimes of work in which beauty had been anxiously sought instead of happily found.

The two finest drawings were the *Lowestoft*, and the *Chain Bridge over the Tees*, and they belong indeed to the best middle period of Turner, and are among the noblest designs of that

noble time. That they fetched their twelve hundred pounds a piece—as the sale lists tell us they fetched—need be no matter of surprise so long as there is wealth in England and healthiness of taste in art. Nor, since we are on the matter of money, is it occasion for regret or wonderment that among the oil paintings which followed the drawings nearly six thousand pounds was paid for a Turner, while three thousand was thought enough for a Sir Joshua so attractive as *Mrs. Stanhope*. Sir Joshua lived some fifty years before Turner, and painted portraits instead of landscape; but we are not aware of any more convincing reasons than these why a higher value should always attach to his work than to the work of Turner; and the picture buyers of our day seem to have recognised that the scale is turning. The *Lowestoft* and *Chain Bridge over the Tees*, then, fetched, like the *Ancient Italy* and *Modern Italy*, no more than their value; it can hardly be said too often that the money value of such supreme art it would be difficult for any generation to over-estimate. The *Lowestoft* and *Chain Bridge over the Tees*, though employing of course whatever resources of colour Turner in his middle period deemed that they required, are not among the drawings that rely mainly on truth or splendour of colour for their impressiveness. In this respect it is instructive to compare them with the glowing *Coblentz* in the collection of Mr. Ruskin, and other drawings of similar aim. The sunny hill-side in *Coblentz* is well-nigh formless: each additional touch, while emphasising form, would have diminished light and vividness of colour. Scale and distance would have been gained at the expense of light and vividness of colour. In *Lowestoft* and the *Chain Bridge*, it is scale and distance that have chiefly interested Turner. The town looms dully out of the mist of the coast as the coast is seen from over sea: the bridge is lifted above us in those secluded mountains of North Yorkshire—over what heights of immense yet measured space.

The oil paintings of Turner in the Munro collection were nearly all of that period of Turner's work next before the last of all: a period in which his representation of the world was rather of a dream-world of his own, but a world too in which the dream was still intelligible. The crowning errors of his latest work—of his brief period of collapse and ruin—are wholly absent from this. And this painted work of the Novar collection shows—and the *Modern Italy* shows it especially—one great characteristic of Turner's art: that he became, until almost the end of all, more and more fertile. The sources of invention, which dry up often so soon with the imaginative writer—so often, too, with the imaginative painter—were fresh with him, and more and more abundant almost to the end. We speak of purely artistic invention and artistic incident. In his quite mature and later work, of pictorial incident and subject it seems impossible for him to have too much for his own pleasure. The materials of many pictures are crowded into one. In *Ancient Italy*, the admitted theme—Ovid banished from Rome—supplies and justifies the complexity and fertility. In *Modern Italy* the infinite variety of beauties of composition and grouping is introduced at no need, but as the expression of the ideal of the artist in his more elaborate work.

Some of the pictures by other artists in this most famous collection demand at least brief mention. There were several Boningtons: two of them among the very finest known by this artist; and to the French methods of practice with which Bonington—whether we are to deem him English or French—was most familiar, is due probably the admirable conservation of his work. Bonington is a painter whose pictures will always appeal less to the general public than to assemblies of experts; nor is it wholly to their praise that one must say this, for the absence of any dominating sentiment—of any personal and individual mind in the artist—to which this is

due, must justly be held to tell against the artist, unless we are to be content to demand of art nothing else than technical excellence. Such men as Bonington and Müller—to name another brilliant artist whose qualities were of the palette rather than of the mind—will never exercise over the imagination of men the sway of our great individual artists.

Etty is the only other painter whose pictures were in the Novar collection in any exceptional array; for the Sir Joshuas were but here and there, and the Constables did not do Constable justice. But Etty was well represented, and he has passed out of fashion. In the main the verdict of the present moment is the right one; though the reaction from that of another generation is perhaps a little extreme. The fault to be found with Etty, in matter of sentiment, is that his female figures, whether nude or partly draped, are the figures of women undressed, and not the ideal figure—the forms luscious, it may be, but never chastened and restrained. All art has long ago recognised that, for the treatment of such subjects as Etty painted, the ideal of the artist is bound to be exalted, and he is bound to realise it. Etty had good colour—colour of good pictorial effect, though the actual flesh painting is often chalky. There is much in the work of Etty that may attract us, but nothing that can attract us with the charm of Style.

FREDERICK WEDMORE.

NOTES ON ARCHAEOLOGY IN ITALY.

At the last sitting of the Imperial German Institute at Rome, the attention of the audience was entirely occupied by the discourse of Prof. Giambattista de Rossi, on the subject of an ancient bird's-eye plan of Rome. Prof. de Rossi had spoken of the other ancient plans of the city at the annual meeting in honour of Winckelmann, in December last, when he expressed his regret at not being able to exhibit a drawing of the greatest mediæval object of this class, viz., the plan of Rome which is preserved in the city of Mantua. Having afterwards got this drawing through the courtesy of Prof. Portioli, he deferred his explanation of it until the Institute should have the opportunity of welcoming Prof. Mommsen on passing through Rome on his return to Sicily and the Southern provinces. Prof. de Rossi proved that this plan, which Portioli referred to the time following the restoration of the Papal See in Rome, soon after the return from Avignon, cannot have been made before the year 1575, pointing out that certain buildings which are here indicated, and which were erected at a later date, were marked on the plan, or interpolated subsequently. There are in the original evident traces not only of two but of more hands. Continuing his discourse, after many important chronological considerations, he ended with a statement which was received with enthusiasm by the audience. He said that Prof. Corvisieri, an indefatigable searcher in libraries and archives, has at last discovered certain documents which put him in the way of discovering the original drawings for the plan of Rome executed by Raffaele da Urbino. These drawings are to be found in the archives of the Arch-confraternity of Sta Annunziata, instituted in Rome in 1460 by Cardinal Torrecremata, in the time of Pius II. In 1465 the Confraternity, to do some good to their neighbours, collected alms for the purpose of providing dowries for penniless girls. The sums collected amounted to a considerable yearly revenue, largely increased by testamentary bequests. By means of one of these bequests, the Confraternity obtained Raffaele's drawings. Prof. Mommsen, who was present at the sitting, thanked Commendatore de Rossi in most generous terms, hoping that Corvisieri's researches may be crowned with success. Meanwhile it is to be hoped that this plan may be published with illustrations by Prof. de Rossi. It will be most useful for the study of Roman topography.

A *propos* of Roman topography we should mention that a reproduction of the famous plan of Rome engraved by Bufalini in 1551 has been discovered in a convent at Cuneo. The Barberini library possesses the only copy of Bufalini's engraving, and, as is well known, a few leaves are wanting. Now in the Cuneo drawing this plan is complete. The Minister of Public Instruction, to whom the drawing was presented, has already commenced its publication on the scale of the original.

On April 2 the excavations of the Forum Romanum were begun. The plan of the Italian Government is to uncover the whole space of the Forum, carrying their operations to the front of the Palace of the Caesars.

In the excavations of the Stadium Palatinum, there was discovered, toward the end of March, a female statue in marble, wanting the head. This work is very delicate in execution, the proportions being a little larger than life. It seems to represent a Ceres, or else an Augusta in the character of that goddess.

TOWARD the end of last month the excavations in Piazza di Pietra, near the present Dogana di Roma, were closed. More bases were discovered of the columns of the so-called "Portico of the Argonauts," with figures in relief of Roman provinces, of rather less than life size. Architectural fragments of the sumptuous edifice were not lacking. Similar bases, discovered in the same piazza, are now in the National Museum at Naples, to which they passed with the Farnesi antiquities; others adorn the Palazzo Odescalchi, and others are at the Campidoglio. It is said that the fragments recently discovered will be exhibited in the same Palazzo della Dogana, where, according to the municipal plan, the Roman Bourse will be located.

In the excavations carried out on April 4 in the presence of Prince Leopold at Pompei the following objects were found: *Gold*—an armlet; a ring with engraved agate; and another plain ring. *Bronze*—a candelabrum; two vases in the form of a *lagena*; a pastry-cook's "shape"; a ring; some bosses; a large vase in fragments. *Glass*—a blue vase with one handle; a bottle; two *ampullae*; one small square vase. *Terra-cotta*—a lamp; two small pots; two olive-flasks; a porringer. *Iron*—a candelabrum. *Lead*—three weights.

MESSRS. GOUPIL'S EXHIBITION.

WE always find something sparkling and something novel in the collections of continental pictures got up by Messrs. Goupil at 25 Bedford Street; the last mode, practised by the deftest fingers. On the present occasion, the firm having opened a fresh exhibition on April 1, we have no reason to complain, although it cannot be affirmed that we find an array of the best men doing their best. Messrs. Gérôme, Troyon, Daubigny, and Pasini are among the choicest of the artists represented.

As to Gérôme, who has three pictures here, it may at once be said that one of them, *Le Fayoum*, a view with small figures of horsemen &c., is to be classed with his least important or valuable productions. On the Banks of the Nile rises some steps higher: men on dromedaries, two vigorously leaping greyhounds, and other figures, passing along a causeway—the long thin shadows taking a lilac tint in the sweet bright light of morning. A clump of greyish-green trees occupies a large portion of the central space, and gives much piquancy to the composition as a whole—we presume them to be olive-trees, but cannot say that they remind us much of those extremely marked arboreal forms. The Bath is a picture of a single figure—a naked harem-woman seated on the edge of the tank, with her back to the spectator, the ample contours being reflected in the clear water: the general tint of the apartment is bluish, relieved by a

warm green glance through the window. This picture approaches the confines of the indecorous more closely than of the beautiful; it is nevertheless masterly of its kind. *Bringing in the Flock* is as fine a Troyon as one can readily see; the sheep and cattle trooping in to their rest outside a farm, the orange flush of evening dyed deep into the scattering clouds. A somewhat similar theme, but of a more decidedly pastoral and less semi-domestic kind, engaged Daubigny in the principal picture here exhibited—the last considerable work, as we are informed, that came from his finely-gifted hand. It is named *Homeward Bound*; and represents a flock crossing a grassy plain, in charge of their herdsman and a brace of sheep-dogs; the yellow moon reigns in the blue sky, with a single star discernible, the mists flit along the ground, faintly touched by the light of the moon, which brings out into prominence a pool at one side of the path. The grass tints and the transparent shadows are delicately given; the general execution being perhaps a little less completed than the artist, had his life been prolonged, would have liked to make it at last. *The Rising Moon* is another desirable specimen of Daubigny: the predominant tint ink-grey, with a look of hushing silence. Pasini's excellent picture, *Dervish Beggar at the Door of a Mosque*, relies more on its architectural than its human *matériel*, both combining into a masterly unity. The brilliancy and force of colour are truly exceptional—not, however, exactly exceptional in Pasini; even the colour is less remarkable than the delicately controlled power evinced in the great space of deep yet soft and liquid shadow which traverses the building below its hooded doorway.

With some other contributors we must be more summary than the merits of the works would very fairly suggest. Such are—Giacomotti, *Going to Evening Service*, a striking candle-light effect; Lefebvre, *Chloe*, a life-sized naked figure, elegantly posed, but lacking a certain touch of distinction; Neuhuys, *The Happy Mother*, a very sweet little domestic interior; Langée, *The Gleaners*; I. Jimenez, *Waiting for the Cardinal*, a picture in which coach and liveries count for most, and singular neatness and brightness of handling for the residue; Campriani, *Going to Market, Rome*, pitiless in sunshine; Israels, *The Industrious Housewife*, a life-sized, full-length, seated figure, considerably more solid in work than the painter's recent productions have accustomed us to; Humbert, *Christ and the Woman taken in Adultery*, a large painting, rapid enough in general treatment, but interesting in the most important respect, the head of the Saviour, in which intellectual dignity and abnegation are well marked; Jacquet, *An Indigent Girl*; Chialiva, *Good Friends*, a girl with sheep, lambs, and poultry, charmingly designed and expressed, but imperfect in colour, especially the blossoming almond-tree which forms so prominent an object; Dalbono, *Neapolitan Dancing-girl*, and *On the Sands near Naples*; Hébert, *The Calvario at Ischia*, a sketch of much classic elegance of manner; Charnay, *A Good Bite*, angling in a mill-stream, very effective and natural. For landscapes we may cite—Corot, *Bridge at Meulan*; Wahlberg, *Night in the Woods*; J. Maris, *Near Rotterdam*, and *Twilight*, dark, dim, and rich, with two goats browsing in the gloom; Lambinet, *Under the Willows*; Diaz, *The Bathers*, lively and airy.

W. M. ROSSETTI.

ART SALES.

WE append the prices fetched by the chief of the Cambridge Rembrandts, sold last week by Messrs. Sotheby. A brilliant impression of the little *Portrait of Rembrandt with Moustaches*, 9l. (Clément); *Our Lord Crucified between Two Thieves*, the fourth state, 24l. (Sabine); *The Prodigal Son*, a brilliant impression, 10l. (Colnaghi); *St. Jerome sitting before the Trunk of an Old Tree*, 20l. (Goupil); *St. Jerome* (Wilson, 109), on curious brownish paper, 29l. 10s. (Noseda); the

rare *Spanish Gypsy*, 52l. (Thibaudeau), and another impression of the same plate, 56l. (Noseda). Among the landscapes, those demanding notice are the little *Landscape with a House and a large Tree by it*—the rare little landscape with the effect of dawn—45l. (Thibaudeau); *View of Omval*, 41l. (Addington); *The Sportsman*, 36l. (Haden); *The Three Trees*—the great storm landscape of Rembrandt—80l.; *The Peasant carrying Milk Pails*, 60l.; and *The Gold-weigher's Field*—a really fine impression—56l. Among the portraits there was the rare first state of the *Clément de Jonghe*, which sold for 33l. (Colnaghi). Finally there was the great rarity of the sale—a print which, it is expected, can scarcely again be offered under the hammer—the *Copes and Paling*, which until the treasures of Cambridge were ransacked, was believed only to exist in the British Museum. It fell to Mr. Thibaudeau's bid of 305l., and we are informed that no public museum—either at Amsterdam, Haarlem, Berlin, or Paris—has succeeded in acquiring it, it having been purchased for a private amateur.

THE Digby Seymour Rembrandts, after all, fetched no less prices as a whole than those of Cambridge—the collection at Messrs. Christie's having been sold for 2,465l. The drawings were of little or no account; but the assemblage of etchings included many of the great and rare works, and though all were not in perfect condition, the collection as a whole was approved. We note the following prices as those most worthy of record:—*Our Lord before Pilate*, 42l. (Sabine); *The Death of the Virgin*, a second state from the Mariette collection, 10l.; *St. Jerome sitting before the Trunk of an Old Tree*, first state—a rare example—140l. (Thibaudeau); *St. Francis Praying*, 31l. 10s. (Noseda); *The Shell*, a second state of a most rare subject—Rembrandt's only etching devoted to "still life"—50l. (Noseda); *The Woman with the Harrow*, the least inelegant of the nude studies of the master, 19l. 19s. (Fawcett); *The Three Trees*, a really fine impression, 130l. (Gurney); *A Peasant carrying Milk-Pails*, 70l. (Noseda); *An Arched Landscape with a Flock of Sheep*, 50l. (Gurney); *An Arched Landscape with an Obelisk*, 100l. (Clément); *A Cottage with White Pales*, 49l. (Noseda); *Old Haaring*, a third state of this rare print, 325l. (Goupil); *Ephraim Bonus*, 101l. (Delisle); *The Gold-weigher*, most rare in the first state, 72l.; and *The Burgomaster Sir*, 220l. 10s. (Goupil).

At the Novar sale, treated of in another column, the following prices were the most noteworthy. For Bonington's *Fish Market, Boulogne*, 3,000 gs. (Agnew); and for his *Grand Canal, Venice*, 3,000 gs. (Agnew). By Constable, *Hampstead Heath*—a work engraved by David Lucas—460 gs. (Bentley). By Etty, *The Graces*, 170 gs. (Agnew). By Hogarth, there were two out of the eight pictures representing *The Harlot's Progress*; one of them sold for 520 gs., the other for 300 gs. (Davis). They came from the Beckford collection. Sir Joshua Reynolds's *Hon. Mrs. Stanhope* sold for 3,000 gs. (Agnew); and *Kitty Fisher*, with the doves (from the Marchioness of Thomond's sale), 700 gs. Of the Turner water-colour drawings the following may be specially noted:—*Glencoe*, 320 gs. (Durlacher); *Loch Katrine*, 320 gs. (Agnew); *The Walls of Rome: Tomb of Cuius Sestius*, 205 gs.; *Rhodes*, 250 gs.; *Acropolis of Athens*, 125 gs.; *Lichfield* (not engraved), 400 gs.; *Orford*, 500 gs.; *A River in Switzerland*—a sketch, 115 gs. (Agnew); *Baths of Pfeffers: Ragatz, Pass of the Splügen*, 1,000 gs. (Agnew). *Descent of the St. Gothard: Airolino in the Distance*, 500 gs.; *Lake of Lucerne*, 590 gs. (Agnew); *Kussnacht: Lake of Lucerne*, 970 gs. (Goupil); *Zürich: a splendid example*, 1,200 gs. (Agnew); *Ashby de la Zouche*, 500 gs. (Williams); *Chain Bridge over the Tees*, 1,420 gs. (Cross); *Blenheim*, 630 gs.; *Knaresborough*, 1,160 gs.; *Lowestoft*, 1,140 gs. (Agnew); *Malmesbury*, 700 gs. (Vokins); *Pembroke Castle*, 600 gs. (Williams); *Ullswater*, 650 gs. Of the oil paintings, *Ancient Italy* sold

for 5,200 gs.; *Modern Italy*, 5,000 gs.; *Rome from Mount Aventine*, 5,850 gs. (Davis); *St. Mark's Place*, Venice, by moonlight, 5,200 gs. (Agnew); *Van Tromp's Shallop*, 5,200 gs. (Agnew); and *Kilgarran Castle*, 3,400 gs. Turner's works at this sale realised 57,000 gs.; and the whole sale brought 73,000 gs.

It is not only in the case of Turner's pictures that prices are keeping up, in spite of "hard times." The sale of Captain Lukie's small collection of old blue and white china, at Christies', on Tuesday, was in its way as remarkable as the Novar sale. The room was crowded, and the prices realised were beyond the most sanguine anticipations. It is true that the pieces offered were of the highest possible quality, but that does not alter the fact that similar pieces might very lately have been bought from the dealers at 30 per cent. less than the amount fetched in this sale. After a number of vases, decorated with flowers, landscapes, or figures, and of various sizes from quite small to the usual "beaker" dimensions, had been sold at from 30% to 150% each, the great sensation of the day was reached when five Hawthorn-pattern jars, of matchless quality, were offered. Two, of pale blue and with silver covers, fell for 230% ; a single one, deep blue ground, but with wooden cover, 450% ; another, quite perfect, with cover, 650% , and another 690% . Two years ago a pair exactly resembling these were sold in the Haymarket for 500% , which was thought at the time quite high enough.

NOTES ON ART AND ARCHAEOLOGY.

THE Liverpool Art Club has on view at its rooms in Myrtle Street, Liverpool, a very interesting and instructive exhibition of works which display to the best advantage the art of Wood Engraving. A little Catalogue is issued, with preface by Mr. J. Newton, giving a very readable view of the history of the art. The collection itself is formed by contributions not only from local members of the club—Liverpool men—but also from well-known London amateurs. The elucidation of a special subject, such as that of the art of Wood Engraving—or the spread of information on that subject—does great credit to the club: much greater credit than could accrue to it by its fulfilment of the easier and more popular task of exhibiting only such works as are immediately attractive to the lightest of art students.

MR. McLEAN, of 7 Haymarket, has opened as usual an exhibition of "Oil Paintings by British and Foreign Artists." Two sculptural works are added, by Houdin and Dalou: the latter is a version, in marble, of the exquisite little group already shown in terra-cotta, *The Brittany Mother*; the mode of working the marble is essentially simple, but none the less the artist takes care to obtain proper variety of texture by ready and direct means. Among the pictures, the *pièce de résistance* is *October*, by M. Tissot—a life-sized figure, from which the painter has also produced a brilliant and effective etching of large dimensions. M. Tissot's personage is a handsome and vivacious girl of some eighteen years, in a black fashionable dress and broad black hat, holding a book under her arm—one might suppose it to be one of the French novels issued in large blue-paper covers, like Victor Hugo's *Quatrevingt-treize*: she steps out with an elastic and decisive gait, as if eager to reach her bourn and settle down to her book—or are we possibly to understand that the pretty maiden has an assignation to keep, and only makes her book a pretext? She is close to a large chestnut-tree, whose thinned and yellowing leaves frame her round with flaunting and fantastic obsequiousness, and a carpet of the dead foliage is spread for her feet. There is much firm and difficult drawing in this work, which pushes individuality to the verge of *bizarrie*: it will long

remain on the mind's eye of those who see it. Other able exhibitors are Messrs. Henry and Albert Moore, Colin Hunter, Boughton (*The Frozen Fountain*—we do not much like the decidedly mannered series of the Four Seasons), Palmaroli, Brandt, Van Marcke, De Haas, Merle, Docherty, Dücker, Edouard Frère (*Shelling Peas*), Glindoni, Jacquet, and Alma-Tadema (the *Roman Kitchen Garden* previously exhibited, with its ranks of long-stemmed onion-plants).

A PICTURE which will have its special public—and that a very large public too, in all likelihood—is now on view at Messrs. Agnew's Gallery in Bond Street. We refer to *The Royal Family assembled in the Green Drawing-Room at Windsor Castle*, by Mr. Lachlan McLachlan—who is, we believe, chiefly a photographer by profession—"painted under the authority and by the express permission" (as a private-view card has it) "of Her Majesty the Queen." We have heard for a long while past something about this picture, and about the immense pains and energy which Mr. McLachlan was expending upon it, and the innumerable obstacles which he found (like all other artists who have ever engaged in similar enterprises) to the successful prosecution of his scheme. At last the picture is finished, and is certainly a very remarkable specimen of its class—well-constructed and well finished. The tint—it is all in monochrome—is rather stony and cold: but this has, we believe, been advisedly done, with a view to future photographic operations. The size of the work is very considerable—about 17½ feet wide by 9½ high; the figures being life-sized. The grouping is effective, skilful, and decidedly natural, considering all the points which had to be provided for, and especially the requirement of showing with distinctness, and even some degree of prominence, every single face in the very large party; indeed, such a result could only be obtained by artistic ability of a superior kind. The picture unites into one composition, subdivided into four principal groups, the Queen, all her sons and daughters, all the daughters-in-law and sons-in-law, two children of the Prince of Wales, two of the Crown Prince and Princess of Germany, and one each for the Princesses Alice and Helena: at the date when the picture was planned out the Duke of Edinburgh was not as yet a father. The assumed standard date may be said to be about four years and a half ago; but this is not, perhaps, carried out with rigid consistency, the eldest German Princess, for instance, who married a few weeks back, being here a girl in a short skirt. The four principal groups may be briefly described as, respectively, the pianoforte group, the table and engraving group, the sofa group, and the children's group. In the first the dominant figure is the Princess Louise, to whom Prince Leopold is handing some music from *Tannhäuser*; in the second, the Prince of Wales, together with the Duchess of Edinburgh and various others; in the third, the Queen, with the Crown Prince of Germany and Princess Beatrice hardly less prominent; in the fourth, along with four children, the Princess of Wales. The picture is to be engraved in Paris; and it is difficult to doubt that, in whatever form of reproduction, it will long continue a favourite with British loyalists.

DR. EDWARD MÜLLER has succeeded Dr. Goldschmidt in the Archaeological Survey of Ceylon.

THERE will no doubt hereafter be occasion for the criticism, here and elsewhere, of the Exhibition of Drawings by the old Dutch Masters which the Burlington Fine Arts Club opens, as we understand, this week; but we may here, without venturing upon criticism either of the works exhibited or of the manner of exhibiting them, call attention briefly to the sources from which the collection is drawn, and to what is likely to be considered as one or two of its greatest treasures. Roughly speaking, about two-thirds of the drawings come from the cabinet of Mr. John Malcolm

of Poltalloch, whose great contribution of designs by the Italian masters made such a worthy show at the Grosvenor Gallery. Of Mr. Malcolm's Dutch drawings, which in variety and richness of interest are at least only second to those of the Italian schools in his cabinet, it is no secret that a great part were purchased *en bloc* from Mr. J. C. Robinson, together with a great assemblage of drawings of other schools, collected by that gentleman. The remaining part consists of numerous and valuable additions made to the cabinet of Mr. Malcolm since the first large purchase. Mr. Cook, of Richmond, who is known as a very large buyer of much valuable art, lends one work only; but that will probably be found to be one of the highest importance, as it is one of the very few coloured drawings by Ostade of high quality which are anywhere to be met with. Mr. Malcolm's large contributions include remarkable specimens of the same master, and Mr. Frederick Locker also sends a coloured drawing which was much remarked at the Grosvenor Gallery. Mr. Seymour Haden's collection will be represented by a series of drawings by Rembrandt; several of them no doubt of the highest artistic quality, and having passed in times gone by through the cabinets of other known amateurs, such as Sir Joshua Reynolds, Richardson, and the late Mr. James. Among the remaining contributors to the exhibition are Sir William Drake, Mr. C. Sackville Bale, Mr. William Mitchell, Mr. Richard Fisher, and Mr. George Smith; and the contributions of one or other of these amateurs, while adding much of general interest to the exhibition, will secure for at least a third eminent Dutch master—Nicholas Berghem—exceptionally good representation in the Gallery. Without expressing any opinion as to how the Burlington Fine Arts Club may have carried out its present undertaking, we may congratulate it on what appears to be in the present case its intention to adhere to the very systematic representation of a school which has not lately been too much in favour. In its gallery the work of the Dutch school, in its drawings lesser or more elaborate, may be studied no doubt in a fashion that will prove instructive.

THE Lords of the Committee of Council on Education have directed that a special loan exhibition of furniture, cabinet work, and ornamental woodwork used in the interior of dwellings, shall be held in the Bethnal Green Museum during the summer months, commencing May 1. This will occupy the space rendered available on the ground floor of the museum by the removal to Paris of the Prince of Wales's Indian presents, till lately shown there. It is understood that the manufacture of household furniture is largely carried on in the East of London, and hence it is believed that the proposed exhibition will be of special interest in that district. The Queen has allowed a selection from the furniture of the Royal palaces to be included in this exhibition.

THE death is announced of Olaudius Jacquand, the historical and *genre* painter. He was born at Lyon in 1806, and made his *début* at the Salon of 1824. Several of his pictures were purchased by the State, and are now in the Luxembourg and at Versailles.

It seems almost impossible to believe that a great national institution like the French Bibliothèque Nationale, which contains treasures whose loss would be irreparable to the whole literary and artistic world, should be suffered to remain for even a day in any danger from fire that could possibly be prevented, yet such, according to M. E. Lockroy's showing in the French Chamber some months ago, has been for many years the position in which it has been placed. Not only is it not isolated from other buildings, but in the buildings immediately adjoining various industries are carried on, many of which are in the highest degree dangerous; even large quantities of combustible oil were, we believe, found to be

tored in utterly reckless proximity to this great treasurehouse of learning. Under these circumstances it has at last been deemed advisable to appoint a commission "to study the question of solution." We should have not thought the question needed much "study," but rather prompt action; yet it appears that the proprietors of the different establishments adjoining the Bibliothèque require such outrageous sums for their property that the Government find themselves unable to meet their demands. It is to be hoped that the present commission will find some means of settling this difficulty and relieving the fears that M. Lockroy's revelations have excited.

AMONG "the curiosities" of the Paris Exhibition, according to the *Chronique des Arts*, will be the display of the treasures belonging to the Préfecture of Police. These are divided into three categories. 1. A collection of the portraits of all the lieutenants, ministers, and préfets of police. 2. Collection of portraits of criminals. 3. Reproductions of all the various instruments used by thieves in the exercise of their profession, such as picklocks, crowbars, jemmies (called more politely in French "monseigneurs"), centrebits, and other valuable tools. More curious than instructive we should imagine such an exhibition, except to the enquiring mind of the youthful thief.

M. WALFERDIN, a French gentleman who possesses a fine collection of the works of Fragonard, has announced his intention of throwing open his gallery to the public every Friday during the Paris Exhibition.

AMONG some tapestries recently sold at the Hôtel Drouot were five of old Gobelins manufacture that came from the Château d'Oiron and had formerly belonged to Madame de Montespan. They fetched 7,500 fr.

A LOAN exhibition has been arranged and is now open to the public in the Town Museum of Leipzig, of about 200 original sketches by Ludwig Richter. Many of these sketches, which consist of pen-and-ink and pencil drawings and water-colour studies, have never been printed, while others are the originals of well-known woodcuts. The rich artistic fancy of the veteran German master is abundantly displayed in this charming little exhibition, which although small is sufficiently representative, as it includes some of the earliest as well as some of the latest productions of his art.

THE *Portfolio* gives two etchings this month from works by contemporary artists, one of them being the pretty modern scene, *At the Villa Borgheze*, by F. Heilbuth, seen last summer at the Grosvenor Gallery. The other is from a painting by Carl Schloesser called *The Reprimand*, an old priest reproving two children who stand by the sea-shore. This, as an etching simply, has the higher artistic value. A facsimile by Amand Durand is also given of Rembrandt's famous *View of Omval*, accompanied by a short but sensible criticism by Mr. Hamerton, who does not agree with the unqualified admiration that has been lavished on this rapidly executed work. In this number Mr. Beavington Atkinson begins his proposed "History of the Schools of Modern German Art" with an account of the "Rise in Rome," dating this from the time when Raphael Mengs and Carstens were working there in the classic spirit of ancient art, and regarding the romantic movement instituted by Cornelius, Overbeck, Veit, and others as the second phase of German art. Illustrations are given of the *Four Riders of the Apocalypse* by Cornelius, and *Christ among the Doctors* by Overbeck.

M. PH. BURRY contributes to the current number of *L'Art* a long and interesting study, or "Silhouette" as it is called, of the contemporary French painter and engraver, Félix Bracquemond, of whom a very fine portrait is given, painted by himself and etched with the utmost skill and

power by Rajon. The other etching of the number—a pastoral landscape by Daubigny, rendered with great truth and beauty of effect by Chauvel—also claims notice.

THE *Basler Nachrichten* states that Herr Meyer-Kraus, Oberlehrer at St. Leonhard, has presented to the Public Library of the Museum of Basel his unique collection of portraits. This collection, which has been the work of many years, numbers nearly 18,000 portraits of notable persons, Swiss and foreign. The donor, who is said by the *Nachrichten* to be an exact and scrupulous historical scholar, has appended genealogical and biographical notices to a great number of them, and has provided the whole series with a carefully edited catalogue.

THE Swiss painter, Arnold Böcklin, of Basel, who has lately exhibited four of his recent works in Berlin, has received an official order to paint a landscape with figures for the Berlin National Gallery, for which a grant of 18,000 marks has been made. An article on the painter's works was lately contributed to *Nord und Süd* by F. Pecht, of Munich.

THE STAGE.

A NEW burlesque extravaganza by Mr. Byron entitled *Il Sonnambulo* has been produced at the Gaiety Theatre. It is, as may be inferred, a travesty of the book of Bellini's *La Sonnambula*. Regarded as a parody, its fun is chiefly derived from representing the Count—and not his newly found daughter—as the wrongfully suspected person of the piece; and from mimicking the leading incidents in Mr. Wilkie Collins's *Moonstone*. The burlesque is bright and lively, and its drolleries are sustained with spirit by Miss Farren, Mr. Terry, Miss Vaughan, Mr. Royce, Mr. Elton, Mr. Soutar, and other members of Mr. Hollingshead's company.

IN his new comedy entitled *Les Fourchambault*, produced with success at the Théâtre Français on Monday evening, M. Emile Augier has again a moral purpose; but it appears to be one of a less definite kind than in the case of his *Madame Caverlet*, which was brought out at the Vaudeville two seasons ago. In *Les Fourchambault* the social sins which are denounced are simply the old-fashioned vices of selfishness, vanity, prodigality, and love of display. When the family of the Fourchambaults, the head of whom is a banker at Havre, are finally brought to the brink of ruin by these failings, it is an honest gentleman of simple habits but with a large fortune who becomes the good genius of the little circle, restores the credit of the house, rescues their orphan ward from a *mariage de convenance* by wedding her himself, brings about the marriage of Mdlle. Fourchambault with a poor but worthy lover to the discomfiture of a more showy suitor, and generally sets a shining example of the superiority of simple straightforward proceedings. In the end this saviour of the family—known only as M. Bernard—proves to be a natural son of M. Fourchambault, by a lady whom the latter had many years before been induced to abandon in consequence of artful reports circulated to her discredit; and it is at the instigation of this forgiving lady that M. Bernard has thus befriended the Fourchambaults. There seems to be little ingenuity of design in the comedy; but the characters are delineated with a firm hand, and the dialogue is stated to be written with all the author's purity of style and loftiness of sentiment. M. Got appears to have achieved a considerable success in the part of M. Bernard.

AN amusing *comédie-bouffe*, entitled *Le Cabinet Piperlin*, has been produced at the Athénée Comique. The cabinet referred to in the title is a matrimonial agency office; the owner of which has conceived the idea of not only finding suitable wives for clients, but of guaranteeing their good behaviour for given periods. It may be easily

conceived that M. Piperlin's devices for assuring himself of the staid propriety of his female clients by subjecting them in the first instance to the fascinations of a clerk known as the *éprouveur* of the establishment give rise to much genuine if not very refined drollery.

A POSTHUMOUS drama, by M. Edouard Plouvier, entitled *Les Filles du Père Marteau*, has been produced at the Troisième Théâtre Français.

MUSIC.

THE BACH CHOIR.

THIS admirable choral society, which appears to have become a permanent institution, gave its first concert for the present season last Saturday evening at St. James's Hall. It will be remembered that the first public appearance of the choir took place about two years ago, when Bach's great Mass in B minor was given for the first time in its entirety in this country. Last year, in addition to a repetition of the mass, the choir brought forward Bach's Cantata "Eine feste Burg," and Gade's *Comala*. For the present season the works of the old Leipzig cantor still form an important item in the programmes; but compositions of other masters are also very wisely introduced; and concerts of very varied interest are offered to the musical public.

The programme of last Saturday was open to only one objection—its extreme length. The concert began at eight o'clock, and was not over till nearly a quarter past eleven; and, as most of the music was of a character making no small demands upon the attention of the hearers, it was not surprising that signs of weariness were manifested before the close, and that the last piece was performed to a rapidly-diminishing audience. It is a remarkable thing that our concert-givers, with very few exceptions, seem quite unable to perceive that their best policy is to send listeners away hungry, and not with their musical stomachs overloaded. It is not too much to say that out of every ten musical performances given in London, nine are decidedly too long. Performers and hearers are alike exhausted, and the works which have the misfortune to come last in the programme inevitably suffer in consequence.

The first part of Saturday's concert was occupied with a performance of the first three of the six cantatas which compose Bach's *Christmas Oratorio*. The entire work was produced at the Albert Hall rather more than four years since under Mr. Barnby, and was at that time spoken of in detail in our columns (*ACADEMY*, January 3, 1874). It will therefore be only needful now to speak of the present performance under the direction of Mr. Otto Goldschmidt. This was in many respects most excellent. Those who have attended previous concerts of the Bach Choir will be aware that it is one of the most thoroughly trained musical forces in London. The precision of their singing in the more polyphonic music is remarkable; though in the *Christmas Oratorio* there is less opportunity for display than in many other of Bach's compositions; indeed, with the exception of some passages in the choruses "Christians, be joyful" and "Glory to God in the highest," the music is comparatively easy. There is, nevertheless, ample opportunity for the display of "finish;" and of this the choir were not slow to avail themselves. The solo vocalists also, Miss Mary Davies, Madame Patey, Mr. Shakespeare, and Herr Henschel, did full justice to their music; Mr. Shakespeare, in the somewhat thankless recitatives of the Evangelist, being especially effective; while the various *obbligati* for solo instruments—violin (Herr Straus), flute (Mr. Svendsen), and trumpet (Mr. T. Harper), were admirably rendered. Mr. T. Pettit, the organist of the choir, handled the incomplete and uncomfortable instrument in St. James's Hall with much judgment. The only

drawback to the complete enjoyment of the performance was that Mr. Goldschmidt took some of the choruses at what I cannot help thinking decidedly too slow a pace. This was more especially noticeable in the opening chorus and in the short movement in the third cantata, "Let us even now go to Bethlehem." In both of these, particularly in the first, the music dragged sadly; there was no swing about it, and the "Christians" certainly seemed anything but "joyful." If the work should be repeated, Mr. Goldschmidt would do well to try a quicker tempo.

Although several "cuts" were made in the oratorio, the performance lasted so long that it was ten o'clock before the second part of the concert began. This part was at least as interesting as the first. It included Schumann's "New Year's Song," Op. 144, given for the first time in London, Dr. S. S. Wesley's Anthem "O Lord, Thou art my God," and Mendelssohn's 114th Psalm. Of the history of Schumann's work very little seems to be known. Wasielewski, in his Life of the composer, says only that it was sketched in December 1849, scored in the following year, and first performed at a subscription concert in Düsseldorf in January 1851. The original text is by Friedrich Rückert, and the English adaptation has been very skilfully made by the Rev. J. Troutbeck. The work is for chorus and orchestra with incidental solo parts for soprano, alto, and bass, and is in six movements, mostly short, which follow one another continuously, the whole piece occupying about twenty minutes in performance. The music dates from Schumann's ripest period—that of the production of his *Manfred* music and the "Rhenish" symphony—and is full of the characteristics of his best manner. It is less abstruse and easier to be followed on a first hearing than many of his other works; and the introduction at the end of the piece of the old choral, "Nun danket alle Gott" is alike felicitous in conception and admirable in execution. The performance of the whole work under Mr. Goldschmidt was excellent, wanting neither precision nor spirit, while the singing of the choir in the sustained *pianissimo* passage "Be ready for reaping" was remarkable for its refinement.

The anthem by Dr. Wesley which followed, written for eight-part chorus with organ accompaniment, is a fine specimen of modern English cathedral music, and an unmistakable testimony to the great abilities of the late organist of Gloucester Cathedral. It is both too long and too elaborate for general popularity, but the work was well worthy of production by the Bach choir. The last item of the programme, Mendelssohn's 114th Psalm, which is far too seldom heard in public, is one of the finest of its composer's sacred works. Written for full chorus throughout, and mostly in eight real parts, with accompaniments for full orchestra, it is distinguished by a certain massive character of its harmonies, and a sustained dignity, which recall the style of Handel. The fine musical feeling of Mendelssohn is well shown in the instrumentation of this psalm. Most composers would probably have used the full orchestra for the opening chorus, "When Israel out of Egypt came," as well as for the second number, "The sea saw and fled." Mendelssohn, however, with great tact reserves his trumpets, trombones, and drums entirely in this part of the work; while the third movement, "What ailed thee, thou sea, that thou fleddest?" is given to the voices accompanied only by the basses; and the first entry of the full power of the orchestra for the words "At the Lord's coming ye trembled" is one of the grandest points of this truly sublime work. The final fugue, "Hallelujah! Sing to the Lord for evermore," is an admirable piece of contrapuntal writing, forming a worthy climax to the whole psalm.

The performance of this noble composition was good but not first-rate. The chief reason for this no doubt was the length of the concert. It was

nearly eleven o'clock when the psalm began, and the chorus must have been pretty well worn out. Hence, though the singing was correct, it was unquestionably tame; and the music is in itself so uninspiring that it is difficult to assign any other reason for the want of energy noticeable than the exhaustion of the performers.

The next concert is announced for the 20th inst., when, among other works, Bach's *Magnificat*, Brahms's *Schicksalslied*, and Mendelssohn's *Erste Walpurgisnacht* are promised. It is to be hoped that the committee, while there is yet time, will see that the concert is kept within reasonable length.

EBENEZER PROUT.

LAST Saturday's Crystal Palace Concert may be not inappropriately described as a "Joachim Concert;" for with the single exception of Beethoven's C minor symphony there was not one piece in the programme to which the name of either Herr or Madame Joachim was not attached. The first piece performed was Herr Joachim's "Elegiac Overture," composed in memory of Heinrich von Kleist. This work has been more than once spoken of on the occasions of its previous performance. The same is also the case with Herr Joachim's "Hungarian Concerto," in which the composer played the violin part, while it would be difficult to say anything new about the great violinist's rendering of the Adagio from Vioti's 22nd violin concerto. The only vocalist of the afternoon was Madame Joachim, who sang a very clever scena from Schiller's *Demetrius*, composed by her husband, and also gave with much effect the great air "Divinités du Styx" from Gluck's *Alceste*, and songs by Schubert and Mendelssohn. This afternoon Brahms's symphony in C minor is to be performed.

THE Musical Artists' Society held a Trial of New Compositions last Saturday evening, in the concert room of the Royal Academy of Music, Hanover Square. The programme included instrumental works by Messrs. George Gear, Charles Trev, E. H. Thorne, G. W. Hammond, J. L. Summers, and O. H. Hullett, and songs by Drs. Bridge and Longhurst, and Messrs. E. H. Thorne, J. Parry Cole, Stephen Kemp, Charles Gardner, and C. J. Read.

MDLLE. ANNA MEHLIG announced a pianoforte recital on Thursday afternoon, at St. James's Hall, at which she was to be assisted by Señor Sarasate. The programme contained as its principal items Bach's Chromatic Fantasia and Fugue, Beethoven's "Sonata Appassionata," and smaller pieces by Schubert, Schumann, Raff, Chopin, Rubinstein, and Liszt for piano solo; three numbers from F. Ries's second Suite for violin, and two pieces composed by Señor Sarasate; while the concluding number was Schubert's Rondo Brilliant in B minor for piano and violin.

MR. SHEDLOCK gave a "Beethoven Night" for his third concert, at the Victoria Hall, Bayswater, last Wednesday evening, when the first part of the programme was selected from the great composer's works, the most important being the Trio for strings in G major (Op. G. No. 1), and the "Sonata Appassionata." The interesting second part of the concert comprised, besides vocal music, Chopin's Sonata in G minor for piano and violoncello, Weber's romantic piano quartett in B flat, and two of Brahms's "Hungarian Dances" for violin.

MR. CARL ROSA brought his season of English opera at the Adelphi to a close last Saturday with a performance of the *Marriage of Figaro*. Of three works promised in the prospectus, two—Nicolai's *Merry Wives of Windsor*, and Brüll's *Golden Cross*—have been produced; the third—Bennett's *May Queen* adapted as an opera—was, we cannot but think very wisely, abandoned. The special feature of the season has been the uniform excellence of the performances; the *ensemble* has been on every occasion when we have been present

most admirable. We trust that Mr. Rosa will soon resume his labours in London. Though himself a foreigner, there is no man who is doing so much for the cause of English opera as he.

AMONG provincial musical associations the Cambridge University Musical Society holds an honourable place. We have often spoken of its choral and orchestral concerts, and we have now before us a set of programmes of the weekly chamber concerts given by the society, at which the performers are with hardly an exception members of the University. From these it appears that a series of eight concerts has taken place; of the enterprise shown by the concert givers, the list of composers important works by whom have been brought forward will be a sufficient proof. We find the names of Beethoven, Mendelssohn, Mozart, Bach, Schubert, Schumann, Corelli, Veracini, Bennett, Brahms, Scharwenka, and Saint-Saëns. Such efforts to promote a knowledge of the highest class of music deserve all recognition.

No. 311, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Original Letters and Papers of the late Viscount Strangford upon Philological and Kindred Subjects. Edited by Viscountess Strangford. (London: Trübner & Co., 1878.)

EVERY student of philology will rejoice at this collection of Lord Strangford's contributions to that subject. They have been brought together from very various quarters, and comprise three letters to Prof. Max Müller, principally on points connected with Arabic, Persian, and Turkish; thirty-four to Mr. E. A. Freeman, chiefly devoted to Modern Greek, Albanian, and the Celtic languages, together with kindred ethnological subjects; an essay on Cretan and Modern Greek, reprinted from Captain Spratt's *Travels and Researches in Crete* another on the language of the Afghans, originally published in the *Journal of the Royal Asiatic Society*; observations on the Turkish language contributed to Murray's *Handbook for Turkey*; and a considerable number of minor papers on various questions bearing on languages and the families of the human race, which appeared principally in the *Pall Mall Gazette*. In a volume such as this there must, of course, be much that only students of the special subjects will understand, and to appreciate it thoroughly a knowledge of languages is required almost equal in range to that of the writer himself. Here and there, also, especially in the letters, we come upon remarks which, though intelligible to those to whom they were addressed, may require explanation for the general reader. When Lord Strangford, in passing from the subject of the Maltese dialect to modern Greek, writes to Mr. Freeman—"You will say that I have ridden my Maltese hobby to death, and that it is time to mount the Byzantine 'unreasonable'"—the reader may be expected, perhaps, to understand the reference to *ἀλογον*, the modern Greek for "a horse;" but when he speaks of M. Papadopoulos Vretos (the author of several works in Greek) as "a Rhizospast deputy," there are some persons who will require to be told that *ρίζοσπαστης* means "a Radical." But it would be a mistake to think that this volume will be found interesting only by the few. Even where the subject is beyond our range, there is a pleasure in watching the writer's method—the facility and nicety with which he employs such a mighty engine as a language, like a steam-hammer, at one time to smash an erroneous theory, at another to crack a nut in the shape of the derivation of a word. And besides this, his style is al-

ways easy and pleasant, and the donnishness of erudition was unknown to him. At any moment, in the midst of the most learned discussion, he is ready to break out into playful sallies, not to say broad fun, the cleverness of which is shown by their containing the gist of the matter, and bringing the point home with irresistible force. Take, for instance, the following remark on the forms of the modern Greek negative:—

"You must be prepared for *δὲν* appearing before consonants as *δὲ*, and not allow your eye to mislead you into mistaking it for *δὲ* of the old Hellenic firm of *μὲν* and *δὲ*, now bankrupt, Athenians and their Philhellenic dupes to the contrary notwithstanding."

Or take the following appeal on behalf of the Lithuanian language, which he regarded, not without reason, as the most important of living European tongues in the eyes of the comparative philologist:—

"Schleicher speaks naturally when he compares his exultation at coming across its 'herrliche Formen' in living speech, after going through hardship and trouble to obtain them, with that of the botanist who has at last come on a rare plant, after searching through brakes and swamps. Nor does Diefenbach unpardonably exaggerate when he says that what may be called its discovery excited hardly less sensation among the learned of Europe than even that of Sanskrit itself. Surely an Eton master, and even an Eton boy, might be moved at hearing that there are Europeans alive, who not only called their sons *sunus*, their beer *alus*, and their bulls *bullus*, but who actually decline them like *gradus* into the bargain, with the *us* short in the singular and long in the plural."

Again, the suggestiveness of Lord Strangford's writing may be illustrated by his description of the use of language by bilingual people:—

"Anybody who has overheard the crews of the Austrian Lloyd's—nay, even Corfiote ladies and gentlemen of the old school—keep up a sustained conversation, knows that it is impossible to say, if a speaker begins to talk in one language, whether or not he will end his sentence in the same. Each comes equally well and natural to the tongue, somehow; though it is odd to the outside listener to find the light blown out, as it were, and himself suddenly plunged into the utter darkness of Slavonic or Greek without a warning. The speakers, however, seem as wholly unconscious of all incongruity as the polyglot little Russian or Levantine children who skip about from speech to speech as a matter of course, without a thought or the power of thought on the subject."

What strikes us most forcibly in reading this volume is the extraordinary extent of the author's researches in language. The sketch of the contents which we have already furnished gives in reality but a feeble idea of this; in fact, it amounted to little less than a knowledge of the whole range of the Indo-European and Semitic families of languages, together with no inconsiderable mastery of the Turanian tongues. And the depth and minuteness of his knowledge were, if anything, more wonderful still. When he knew a language, he made himself master of its dialects also, and no detail of these escaped him. In this way, starting, as he did, from true principles of philological science, he was able in each case to seize on the determining features, and to draw his conclusion with regard to the affinities, the age, and sometimes even the history, of the given form of speech. The whole volume

is full of instances of this, but we may cite as especially worthy of notice his essay on the Afghan language, which he determines to have been allied more intimately with Zend than with Sanskrit, but more exposed to Indian than to Persian influences during the period when the old Persian languages were breaking up and the modern Persian in course of formation; the very learned discussion of the Persian dialects by which that essay is accompanied; the investigation of the Persian words in Arabic, and of the Arabic words in Turkish, concerning which latter his conclusion is that they come through a Persian channel, and are used with a Persian construction and idiom; and the remarks on the Maltese dialect—"that pleasant jargon for which I have a weakness quite out of proportion to its merits"—which he finds to be "Barbary Arabic, and distinctively that of East Barbary, or Tunis and Tripoli." As to his knowledge of the languages of Central Asia, we may quote the testimony of M. Vambéry in a notice prefixed to this volume, who says:—"Lord Strangford was not only a thorough—nay, the most thoroughly grounded scholar in the Turkish language and literature, but he was, besides that, intimately acquainted with all the other dialects of the Moslem populations of Asia." "He could not only trace every termination or affix in the various linguistic groups on the Volga, the Oxus, and the Jaxartes, but he could follow them across the Sajan mountain ranges to the Jenissei and the Lena."

The insight which we thus get into Lord Strangford's philological attainments only increases the regret which we feel at their not having resulted in any permanent work. It is something to meet with an Englishman who, without desiring to win a position, or make a name, or write a book, pursues the study of philology from pure enthusiasm; but the loss to the world is great, notwithstanding. The knowledge of Turkish, which M. Vambéry speaks of, survives in a short and popular sketch, admirably clear, like all his writings, but containing little more than may be found in any Turkish grammar; and his acquaintance with its dialects in a few valuable remarks addressed to Prof. Max Müller. He himself attributes his unwillingness to undertake a treatise to the wideness of his linguistic sympathies.

"I wish I could write a book; but I can't, because I sympathise with a thousand subjects, instead of knowing any one subject as a master. If I could keep to Turk exclusively, let us say, or Greek exclusively, I might do it; but I sympathise much too actively with both to stick to either."

To this must be added his fastidious dislike of appearing openly before the public. This is curiously illustrated in the case of his paper on the Cretan dialect, the most elaborate essay he ever wrote, which, he tells Mr. Freeman, was only intended for private circulation, and having found its way into the ordinary copies of Captain Spratt's work "through somebody's oversight," was "a nuisance" to him. Yet no one was more generous in communicating knowledge, and as long as his correspondent or auditor was intelligent, he was ready to impart to him alone what the world would have been glad to hear. He speaks of him-

self as a mere *dilettante*. "Pray do not put yourself out of the way to answer my letters. Time is valuable with you, while I am an absolutely idle man, with nothing to do but to rove about in body and mind." Yet his philological caution specially fitted him for being a leader in the study. Here is an instance of his dislike of guesswork:—

"In looking at Albanian, I am in the position of one looking as it were across the Channel at barbarian Frenchmen with no historical or literary record of their language, calling water *ô*, which, by my hypothesis, I have no resource for writing down other than phonetic spelling. How am I to know that that has anything to do with *aqua*? An Albanian calls water *uqe* (*oŷye*). I declare I have no means of deciding or guessing whether this be a phonetic corruption from the root of the *Achelous*, let us say, or from an old cognate of *ὕδωρ*."

One would like to have watched him at work in observing and experimenting on a new and curious "subject," such as his life in the East of Europe must frequently have brought within his range. He speaks of "a very safe and good Greek, a Cyprian, professor at Corfu," as having warmed his heart by pronouncing his doubled consonants as an Italian or Arab would. And elsewhere he observes that he has found all Barbary men that he has talked to very shaky in respect of the distinction between the emphatic and the ordinary dentals. It is rare to find this ready power of observation coexisting with extensive book-knowledge.

The other languages of the Balkan peninsula, besides Turkish, as might be expected, are frequently treated of in this volume. Of the Slavonic tongues we hear little, though M. Vambéry assures us that Lord Strangford had mastered nearly all of them in their most minute details. But on Albanian there are not a few important remarks, especially with regard to the influence which Latin in various ages and forms has had upon it; thus he points out that such words as *kíel*, heaven, *kjepa*, onion, *fkin*, neighbour, are not only Latin, but Latin of the classical period, because the hard pronunciation of *c* before soft vowels has been retained. In one of his letters to Prof. Max Müller he promises some notes on the Wallachian dialect south of the Danube, a subject of great interest, and hitherto very imperfectly treated; but as none such are printed here, it is to be feared that they were never written. This is the more tantalising because he has made some valuable remarks on a small isolated colony of that people in Istria, who are shown by test-words in their speech to belong to the southern branch of the race. The essay on Cretan Greek as now published has the additional advantage of having been revised by M. Jeannarakis, the editor of an excellent collection of Cretan popular songs (*Kretas Volkslieder*), who is himself a native of that island. We wish we had space also to give the author's views on the pronunciation of Greek, and on the relation of accent and quantity; but for these we must refer the reader to the work itself. We should say in conclusion that the task of editing this volume has been very carefully executed. Now and then there are mistakes of names, as Greg for Gheg, the Albanian tribe, and Okonómas for Oeko-

nómos; but to anyone who has superintended the printing of another's manuscript, the wonder will rather be that these are so few. A short but convenient index enhances the value of the book.

H. F. TOZER.

The Ecclesiastical Calendar: its Theory and Construction. By Samuel Butcher, D.D., late Bishop of Meath. (Dublin: Hodges; London: Macmillan & Co., 1877.)

MANY of us have no doubt in an idle moment looked with a certain wonder at the Tables to find Easter Day, the Sunday Letter, and the places of the Golden Numbers in the Calendar, which follow the Table of Lessons in the Prayer-Book; but probably very few know how much antiquarian knowledge and scientific skill are required to understand fully those few pages. A particular portion of them—that relating to the finding of Easter Day—was discussed several years ago by the late Prof. De Morgan in a Dissertation inserted in the *Companion to the British Almanack* for 1845, large extracts from which are given in the *Prayer-Book Interleaved*, by Dr. Campion and Mr. Beaumont; but nothing like a complete treatise on the ecclesiastical Calendar, from the point of view of an astronomer as well as an ecclesiastical antiquary, seems to have been written since the days of Christopher Schlüssel, better known as *Clavius*. He, having been the principal adviser of Pope Gregory XIII. in the reformation of the Calendar, published in 1603 a very full explanation of it—which is, in fact, a complete treatise on the ecclesiastical Calendar—under the title *Romani Calendarii a Greg. XIII. Pont. Max. restituti Explicatio Clementis VIII. jussu edita*. This gave for its own time and within the limits of the Roman Church all the information on the subject that could be desired. But since the days of *Clavius* astronomy has acquired greater exactness, and Calendars exist in many countries differing in some respects from that used in the Roman Church. There has hitherto been no complete treatise on the ecclesiastical Calendar as adapted to the use of the English Church, but that want is now amply supplied by the very full, careful, and exhaustive treatise which was left in MS. by the late lamented Bishop of Meath, and is now published by his sons. It leaves, we think, little or nothing to be desired; it is the work of a man competent to discuss the astronomical questions which necessarily meet us in an investigation of the Calendar, and also to carry out the necessary archaeological researches. It not merely gives all the information necessary to enable us to make an intelligent use of the Calendar, but the information and the mathematical formulæ which are required to construct it. Though it is specially a treatise on the "Tables and Rules for the Moveable and Immoveable Feasts" prefixed to the English Prayer-Book, it contains much interesting information with regard to Calendars generally. And though an "old almanack" is proverbially a thing dry and useless, the study of Calendars is in fact far from uninteresting; the great natural measures of time—the solar day, the intervals between successive new moons, called luna-

tions, and the solar year—being incommensurable, the lunation not containing an exact number of days nor the solar year an exact number of lunations, ancient Calendars are a record of the efforts of men to adapt them in some way to the uses of civil life.

Perhaps we may best give an idea of the nature of the work by one or two specimens of its contents.

What do we mean when we speak of *Anno Domini*? What is really to be understood is this. In the sixth century, Dionysius Exiguus, a Roman abbot, thought that he had determined that Christ was born Dec. 25, in the year of the city 753; and he proposed that the first year of the Christian era should be that which began on January 1 following. Thus the year A.D. 1 is *not* the year in which Christ was born, but *the first current year after it*. But when we come to reckon backwards, the supposed year of the Nativity is included in the reckoning, being counted as B.C. 1. Astronomers, however, have adopted a more scientific method, making the year of the birth of Christ zero, belonging to neither scale; so that their series runs B.C. . . 3, 2, 1, 0, 1, 2, 3. . . A.D. This, according to Dr. Butcher, was first adopted by J. Cassini.

We do not know that we could anywhere find a more succinct and accurate account of the Julian reform of the Calendar than that which is given in this work. It is curious to observe that at that time the winter solstice was assigned to December 25 (Christmas Day); the vernal equinox to March 25 (Annunciation B. V. M.); the summer solstice to June 24 (Nativity of St. John Baptist); the autumnal equinox to September 24 (the festival of B. V. M. de Mercede). The connexion, in this case, of the ecclesiastical with the astronomical Calendar is pretty evident. The intercalary day in leap-year was inserted between the *Terminalia* and the *Regifugium*, February 23 and 24, and was written in dating *Bissexto*, or *ante diem Bissexturn cal. Mart.*, and the year which contains such a day was called *annus bissextilis*, our *bissextile*. The Roman mode of reckoning, having been retained in the ecclesiastical Calendar, gave rise to a peculiarity in observing the festival of St. Matthias, February 24; if it was observed in leap-year, as in other years, on the sixth day from the calends of March, it would fall on the 25th day, not the 24th, from the beginning of the month. And this is in fact the rule of the Roman, as it was of the Sarum and of the earlier English Calendars; but at the revision of 1662, the ancient practice of intercalating between the 23rd and 24th was given up, and that already adopted in the Civil Calendar—namely, making February 29 the intercalary day—was adopted in its stead. Even after this, however, some of the almanack-makers still adhered to the custom of placing St. Matthias' day in leap-year on the 25th, and there was probably some diversity of practice with regard to its observance: for Archbishop Sancroft published an injunction in 1683 requiring all parsons, vicars, and curates to take notice that the feast of St. Matthias is to be celebrated on February 24, whether it be leap-year or not.

The letters which designate the days of the week in the Prayer-Book calendar are an adaptation from the ancient Roman, in which the days of the week—as we may call it—of eight days were marked by the letters from A-H. Our seven-day week is similarly marked by the letters from A-G, and the letter which—except in leap-year—designates Sunday throughout a year is the “Sunday letter” for that year. Leap-year is so called because in it—as the Prayer-Book of 1604 tells us—“the Sunday letter leapeth”—i.e., it uses two Sunday letters instead of one, and consequently the Sunday letter of the year following is separated from the Sunday letter of the year preceding by an interval of two letters instead of one.

Why is Easter a moveable festival? Dr. Butcher says (p. 3): “*Sunday* is a moveable festival; consequently, so is Easter Day”—which is true, but not quite a satisfactory answer; for Easter Day would still have been moveable, with reference to the Julian Calendar, if the opinion of the Quarto-decimans had prevailed, and Easter been celebrated on the fourteenth day of a particular moon, without regard to the day of the week; for the fourteenth day of a moon cannot fall on the same calendar-day in successive years. The fuller answer is that it is the successor of the Jewish Pascha, and that the Jewish Calendar was lunar: the fourteenth day of the month Abib meant the fourteenth day of a certain moon. And although the Church has deliberately avoided celebrating Easter on the same day as the Jews celebrate their Pascha, it has always endeavoured to keep it in a certain relation to the Paschal moon. Hence the complicated and difficult methods of determining Easter which have at different times been practised; hence controversies as to the proper day for keeping Easter which can hardly even now be considered extinct; for every few years some gentleman, looking at his astronomical tables, writes to the newspapers his apprehension that we are about to celebrate Easter on the wrong day. A controversy of this kind occasioned Prof. de Morgan's dissertation, already referred to. We must refer to Dr. Butcher's pages for the full explanation of the rules for finding Easter; but so much as this may be said, that the time of Easter is not regulated by any actual astronomical full moon at all, and that for an obvious reason. As the time of full moon is different (say) at London and Dublin, if the Paschal full moon, by observation, fell at a critical time, the English Easter might differ by a week, or even possibly by a month, from the Irish Easter. The Paschal full moon is therefore determined by a cycle, which, though not coincident with the actual course of the moon, is never very far distant from it. This cycle is founded on the fact—discovered by Meton, an Athenian astronomer, in the fifth century before Christ—that nineteen solar years are almost exactly equal to 235 lunations, and that, consequently, after the completion of any period of nineteen years, the new moons (and therefore the other phases) recur in the same order on the same days of the month. The nineteen numbers which were set opposite the days on which the full moon could possibly fall in the margin of

ancient permanent Calendars, being generally illuminated in gold, came to be called the golden numbers. We must again refer to Dr. Butcher's pages for a fuller account of the application of this cycle to the Christian Calendar, and also for the explanation of the fact that the astronomical moon is not always coincident with the moon of the cycle.

What Dr. Butcher says about the names of the days of the week—which is, however, a mere *obiter dictum*—is not quite satisfactory. “Our English names of the weekdays are,” he says (p. 23), “partly of Roman, partly of Scandinavian, descent. To the former belong Sunday, Monday, and Saturday; to the latter, the remaining four days.” There surely can be no doubt that they are all alike of Roman, or rather of classical, descent, and all alike translated into equivalents by our Teutonic forefathers; Thursday is as much the translation of *Dies Jovis* as Sunday is of *Dies Solis*. It is perhaps worthy of notice that, while in most modern languages the first day of the week is designated by some derivative of *Dies Dominica* (e.g., *Dimanche*), and the seventh by some derivative of *Dies Sabbati* (e.g., *Samedi*, *Samstag*), we English have retained the Pagan nomenclature unimpaired. Dr. Butcher does not appear to have seen Julius Hare's essay on the “Names of the Days of the Week” in the first volume of the *Philological Museum*, or the authorities to which he refers.

There is a very interesting account of the Gregorian reformation of the Calendar in 1582, on which our limits forbid us to dwell. Such was the state of confusion into which things had fallen, that from 1500 to 1582 no less than fifty-four Easters out of eighty-three had been wrongly celebrated, and, if this confusion had continued, after A.D. 2698 there would have been no *legitimate Easter*. What was actually done by the Papal Bull was that ten days were dropped in October, 1582, so that the day following October 4 was reckoned October 15. All this trouble might have been avoided (as Dr. Butcher notes) by simply enacting that the vernal equinox should for the future be fixed to March 10 or 11, when it then actually fell; but the tradition which assigned it to the 21st, and forbade Easter to be celebrated before that day, was too strong. In England the new style was adopted by Parliament in 1751, and the day next following September 2, 1752, was called September 14—the error, which amounted to ten days at the time of the Gregorian reformation, having increased to eleven.

In conclusion, we may say that there is no subject tending to illustrate the Prayer-Book Calendar on which the lamented author has not given full and accurate information; the Calendar is now the best-commented part of the Prayer-Book.

S. CHEETHAM.

French Poets and Novelists. By Henry James. (London: Macmillan & Co., 1878.)

SOME people, we believe, are of opinion that there is too much criticism nowadays. It is hardly to be expected, however, that critics

themselves should be thus minded; and for our own part we are very glad to welcome plenty more of it. It is extremely unlikely that any man of competent culture and intelligence can set himself seriously to work to tell us how the productions of other men affect him without teaching us something the learning of which is both interesting in itself and useful as a help to the study of his subjects. In great part of the book before us, moreover, Mr. James speaks with the authority of actual experience. He has himself applied his notions of what a novel should be to the task of actual novel-production, and that not without considerable success. The fact does not, perhaps, add to the authority of his criticism, but it certainly adds to its interest. The contents of the book are sufficiently miscellaneous. There are three essays on French poets, De Musset, Gautier, and Baudelaire; four on French novelists, George Sand, Balzac, De Bernard, and Flaubert; and some others on subjects which, though not exactly answering to the title, are not very far removed from it, such as the Russian novelist Turgénieff, Mérimée's *Lettres à une Inconnue*, and so forth, besides a paper, the most interesting of all, to our thinking, on Mr. James's own impressions of French actors.

We may say at once, and frankly, that Mr. James does not take high rank as a poetical critic. There is indeed one remark of his, which, unless we mistake him, settles his claims in this direction. He speaks of Poe's “very valueless verses.” Now we are of course well enough aware of the incomprehensible fancy of American critics for depreciating Poe, and we are also well aware that all critics are entitled to differ as to his comparative merits according as they take for their criterion his best, average, or worst work. Perhaps Mr. James only means that some of the verses are very valueless. But if he means to apply that epithet to “Annabel Lee” and “The Haunted Palace,” to mention no others, we must regretfully inform him that he is out of court. He thus confesses himself to possess no ear, and, without an ear, poetical criticism is impossible. It so happens, however, that no one of the three poets treated by Mr. James is a poet pure and simple, and hence there is still much that is interesting in his essays. That on Gautier abounds with ingenious epigram, and will be found very amusing reading. Mr. James's admiration for Alfred de Musset is satisfactory, after the rather hard measure which both in England and France has been of late years dealt to that poet, and the critic's appreciation of things dramatic makes his verdict a valuable one. As to Baudelaire Mr. James will hardly expect us to agree with him. His remarks are, however, decidedly interesting as presenting very well the merely common-sense view of the matter—a view which is indeed generally that which Mr. James prefers. The fault is that the writer has not taken in anything like the whole of his subject. Somebody has very happily observed that the decriers of Voltaire speak of him “as if he had never done anything but write the *Pucelle* and make jokes on

Habakkuk." Mr. James and his like write of Baudelaire as if he had never done anything but write *La Charogne* and talk about baby's brains. It is rather amusing to find that Mr. James makes absolutely no mention of the *Petits Poèmes en Prose*. "*Les Bienfaits de la Lune*" and "*La Belle Doro-thée*" would have squared but awkwardly with his theory of Baudelaire's exclusive devotion to "the nasty."

Very different is Mr. James's handling of the novelists. His essays on Sand and Balzac are really admirable. One feels not only that he is thoroughly acquainted with the whole range of subject in each case, but that his matter-of-fact, external way of looking at it has its advantage. As an instance of this we may mention that while his admiration for Balzac is unstinted—indeed those who know Mr. James's own novels can best judge of this—he fully admits the "lack of charm" which is the great fault of the *Comédie Humaine*, and which most of its admirers deny so lustily. Again, after speaking with the utmost relish of George Sand, he confesses that he cannot read her books twice, a difficulty we fancy more often felt than admitted. If we had to find fault with this part of the book we should say that the life and personality of the writers seems to possess a rather disproportionate interest for Mr. James, but this is natural enough in one who is evidently a student of life and character rather than of books. On the other hand it would be difficult to find a better piece of mere book criticism—putting the opinions expressed aside—than the notice of *Madame Bovary*, not an easy book to criticise either. It is curious to contrast with this Mr. James's summary depreciation of the masterly *Tentation de Saint Antoine*. In dealing with Charles de Bernard the criticism is again one of the man almost as much as of his work, and a capital piece of criticism it is of its kind. The miscellaneous essays at the end of the book will not be of least interest to the reader. The first is on Turgénieff. We are not told whether Mr. James derives his knowledge of the Russian novelist from the originals or from translations, but whichever of the two be his source of information, he has evidently studied his subject very carefully. The paper might, perhaps, be better entitled "The Characteristics of a Novelist, as exhibited in Ivan Turgénieff," and it contains some interesting hints as to Mr. James's views of his own function. We are very glad to see that he fully recognises the necessity of basing novel-writing on the study of character. The two next papers are on the letters of the Ampères and of Madame de Sabran, and they are capital examples of the sort of narrative exposition which Sainte-Beuve put in vogue. In treating of Mérimée Mr. James is, perhaps, again a little inadequate, because the man in Mérimée is distinctly inferior to the *littérateur*. But the dramatic criticism which closes the volume is very pleasant and full of life. Mr. James is one of those good Americans who have gone to Paris before they die, and his enjoyment of the fine things Paris has to offer is quite exhilarating. Altogether the book is one to be recommended, though we should like exactly

to reverse the order of its component parts, because, as it is, Mr. James has not put his best foot foremost. As a critic of pure literature he is somewhat defective; but as a critic of life as represented in literature he takes very high rank indeed, and gives promise of much success in his other and more peculiar vocation of novelist.

GEORGE SAINTSBURY.

China. Ergebnisse Eigener Reisen und darauf gegründeter Studien, von Ferdinand Freiherrn von Richthofen. Erster Band. Einleitender Theil. Mit xxix Holzschnitten und xi Karten. (Berlin: Reimer, 1877.)

(Second Notice.)

IN this second section of his volume our author deals first with the knowledge which the Chinese themselves have acquired of the geography of their own country; beginning with a very full, and (as far as I am aware) quite original discussion of the famous *Yü-Kung* or Roll of *Yü*.

"This claims the highest interest among all works of indigenous geographical literature, as the view given therein of the extent of the Emperor Yau's dominion, and the method of its administration, allows us to have more trustworthy glimpses of the yet older primeval history of the Chinese people, and of the development of their civilisation, than any that we can obtain through the historical books. At the same time, this document is the key to a large and important part of the geographical nomenclature of China, and if we omitted now to give the *Yü-Kung* a preliminary consideration in some amplitude of detail, we should have to interpolate numerous discussions with reference to that document in the later portions of this book" (p. 275).

The ample chapter (viii.) which contains this discussion extends to nearly a hundred pages; and in his explanations Baron Richthofen takes a view of the work entirely different from that given by previous interpreters, who have followed Chinese commentators. These orthodox interpretations of the cramp diction of the document all assume that it describes vast (and impossible) hydraulic works, in the damming and diversion of great rivers, executed by *Yü*, the great minister of the Emperor Yau (at least 2000 B.C.); but Richthofen argues that there is no foundation for this idea in the words of the document. Literally rendered they set forth, in very condensed outline, the main features of the provinces of the empire as it then existed. The glosses purporting to refer to the surveys and engineering enterprises of *Yü*, as bearing on those features, have no root in the text; they are a colouring imparted by the preconceptions of the commentators.

It would be presumptuous to say that Baron Richthofen has made good his case, until some Sinologist of recognised competence has admitted the fairness and adequacy of his renderings. But his interpretation is consistent and intelligible, and commends itself to the reader, educing intelligent interest from what has been hitherto a haze of myth and impossible achievement.

Chapter ix. continues the subject of the further development of the knowledge of

their own country possessed by the Chinese. It contains much that is interesting in regard to Chinese map-making, from the earliest antiquity to recent times. The instruments in use even now are of the rudest kind. Twice in the (comparatively) modern history of China astronomical instruments of high technical and artistic quality have been introduced by the influence of foreign *savants*—once under the Mongols, and again by the Jesuits under the Manchus. The latter apparatus are described by Verbiest and Le Comte, and engravings of them are given in Dubalde. The earlier instruments are described by Trigautius, and a drawing of the most remarkable of them forms the frontispiece to the second volume of *Marco Polo* (2nd ed., 1875). But in both cases the methods of use were speedily lost. The Jesuit instruments are indeed of a character now as obsolete as the Mongol ones; and both figure only as items among the minor sights of Peking. The Chinese compass, even as now used, is of the rudest construction. But its application in detail is much aided by that wonderful power of orientation which is born with every Chinese, and is strengthened in him by education:—

"Although there are words for right and left, these are very seldom used. . . . You will frequently hear of 'the north hand,' 'the south ear,' &c. The packages on a mule are 'too heavy on the south side; they must be shifted northward,' and so on. Even on a cloudy day, or in a labyrinth of streets, when no guides to orientation are visible, the Chinaman can always determine his north and south approximately" (p. 390, note).

The Scotchman, who in church asks his neighbour to "sit a bit wass," would be quite at home in China.

Chapter x. is on Development of intercourse between China and the People in the South-West of Central Asia. This, like the preceding chapter, is rife with suggestive comment on the growth and nature of Chinese culture. We must try to present a sample. But brief extract is difficult, for there is nothing epigrammatic in our author's copious style.

"The excellences as well as the failings of the Chinese may be traced back to these facts of their development in seclusion, and of their unbroken consciousness of superiority to all the other nations of the earth within their knowledge. Only under such conditions could their civilisation have grown up out of their innermost being, and rounded itself, as it has done, in perfect harmony with their mental idiosyncrasy and tendencies. And hence it is that we shall hardly find any highly civilised people in existence, in whom identical fundamental traits predominate, as they do in China, at once in the character of the people and of their institutions, in their political administration, in their family life, in the rules of their social intercourse, and finally, as the consequence of all these, in the current of their history. It is true that there are, at least to appearance, flat contradictions in the character of the Chinese. They possess a refinement of social tone which penetrates the lower strata of the population in greater degree than is commonly the case in Europe, and a highly elaborated code of politeness which has become embodied in the formality of their rules of life. But it is with astonishment that one becomes conscious of the survival, side by side with these politer characteristics, of the inhuman grossness and barbarous destructiveness of the nomad races. This manifests itself at

once in the absence of all sympathy with the sufferings of those who are not united by any special bonds of relation to the individual, in the delight which the people take in the infliction of the most frightful cruelty on an enemy, and in the pleasure which they manifest, alike in the massacre of a multitude of human lives, and in the devastation of man's work. An analogous contradiction is seen in the strict uprightness of the Chinaman where he has made, or tacitly recognises, an engagement, in contrast with his boundless love of cheating where he regards himself as untrammelled by such considerations. Similarly we note in this people their strict love of truth in the relation of historical events, and their endeavour after correct knowledge where statistical facts are in question, in contrast with that absolute abandonment to lying and dissimulation, which prevails alike in daily life and in public diplomacy. Again, the Chinese have undoubtedly in a high degree both talent for observation and capacity of thought, and these have led them not only to practical inventions, but likewise to attainments in learning of no inconsiderable magnitude, and to a general appreciation of such attainments. But it is astonishing to perceive at the same time the entire absence of the power of abstraction, of efforts to infer the causes of phenomena or deduce their laws, and, in fact, of all recognition of the laws of causality and of any scientific method. Such discrepancies look like psychological riddles. But they are certainly to be accounted for by the fact that no purifying and ennobling ideas have been introduced from without, such as might have checked the innate element of barbarism; and in this way the Chinese have missed that comprehensive development in which the results of intellectual progress are shaped and leavened by higher aspirations existing in the character of extraneous races, and which is unattainable without free mutual intercourse" (pp. 396-397).

Again:—

"It has been the destiny of the Chinese to impress their civilisation upon other nations. But this has only taken firm hold upon such of these nations as have accepted it wholly and entirely, along with the associated written character, literature, manners, customs, and dress. Such has been the case with the once independent tribes of South-West China, who have adopted even the history of their conquerors as their own, and with some others, like the Manchus, who, as a consequence of intimate association, have got assimilated to the Chinese. But the Chinese culture has nothing like the same hold where a people, dazzled and attracted by its high development, has advanced halfway towards its adoption. This is the position of the Japanese. Entirely without the power, it would seem, to develop a culture of their own, but endowed in an unusual degree with receptivity and intellectual quickness, they imbibed greedily whatever China had to offer when they first made acquaintance with that great Neighbour. But their character, with its mutability, its lively but undeveloped and unmethodical spirit of enquiry, its great though restrained energy, ill adapted them for wearing the garments that they had borrowed. Chinese culture was a coat that did not fit them, and it was only for lack of a better that they clutched at it" (p. 399).

The clearness of vision with which Riechthofen discerns and expounds essential physical features, he brings also with analogous power to bear on the great outlines and essential facts of history, in dealing with this branch of his subject; and he thus orders it in *epochs*, the fundamental nature of which commends the distribution to the reader's judgment, and fixes it in his memory.

No one can ever think of the Great Wall again with that kind of wondering contempt which the mention of it, e.g. in Gibbon,

leaves behind, after reading the passage of which this is an extract:—

"It was a masterly project. Only a man so far-sighted as the Great Emperor (Shi Hwang-ti) could have compassed it! And though his memory is odious to the Chinese, they should consider that, even if it be true that self-aggrandisement was his ruling motive, no ruler has exercised an influence on the course of their history at once so strong and so beneficial. That the enemies within the frontier might be mastered, and the work of civilisation secured, it was absolutely essential that the external enemy should be kept out. And *this* was the first result of the Great Wall. The second lay in the fact that now at last the Emperor could mass large forces under unity of command, and could at one blow do more to promote the absorption of the independent tribes, than all the separate princelings had been able to achieve in centuries of piecemeal effort. The third result of the erection of the Great Wall was this: that now for the first time Chinese armies could march in force through Central Asia to the confines of Western civilisation, and thus, through the widening of the horizon, a powerful impulse was given to the intellectual life of the nation. A fourth and last result was the diversion of the steppe-tribes from their endeavours to overrun China, and the deflexion which this gave their movements towards the West, and in the direction of Europe" (p. 435).

This is a turning-point in history which has vividly impressed the writer, and he recurs to it repeatedly (e.g. pp. 401, 445, 727).

As a prelude to the whole subject of intercourse between China and the West, the author deals with such indications of primeval communication as that which has been often pointed out in the division of the heavens into Lunar Mansions, a system found in the astronomy of the Chinese, of the Hindus, and of the Arabs. We can only quote a few lines indicating in what circumstances he seeks the solution of these coincidences. After referring, among other points, to speculations, set forth in the first part of the volume, regarding physical changes in the region of the Oxus and Jaxartes, he proceeds:—

"Should further research establish these deductions, which as yet are in part but theoretical, hardly any remaining difficulty will encompass the question how those who were the bearers of civilisation along the extreme circumference of Asia, in the East and in the South, came to be the common possessors of one astronomical system. It may well be that these nations (destined eventually to migrate in opposite directions, on the one side eastward by the basin of the Tarim, on the other side westward and south-westward by way of Turan) may, while they yet dwelt as neighbours on the opposite flanks of the Pamir, where long spells of cloudless sky favour the observation of the stars, have partaken and stimulated a common growth of culture" (p. 415).

The Periods of Intercourse are ordered as follows: 1. Traditions of Intercourse before the rise of the Chow (*Tshou*) Dynasty (B.C. 1122); 2. From the Chow to the Building of the Wall (B.C. 212); 3. From the Building of the Wall till the accession of the T'hang (A.D. 619); 4. From the T'hang to the Rise of the Mongols (A.D. 1205); 5. From the Rise of the Mongols till the arrival of the Portuguese (1517); 6. The Modern Intercourse and growth of knowledge.

No period is more rife with interesting questions than the third of the above, which embraces such subjects as the Discovery of the

Western Lands of Civilisation (Bactria, &c.) by Chang-Kien (c. B.C. 127), and the first attempts of the Chinese to reach India; the silk trade, and the knowledge of the Chinese in the West, by the land route, as *Seres*; the sea-traffic and the knowledge of the Chinese, by this route, as *Sinæ*; with the Roman embassies to the Court of the Han Dynasty.

Baron Richthofen has often to treat of questions which the present writer has formerly ventured to handle; and more than once, where he comes to a different conclusion from mine, I am bound to acknowledge that he seems to have reason on his side.

Richthofen does not admit the allegation that the princes of the Tsin Dynasty, to which Shi-Hwang-ti, the Wall-Builder, belonged, had ever spread their conquests or their fame over Central Asia; and he doubts whether the name *Sinim*, in that famous passage of Isaiah, referred to the Chinese; if it did, it must have come, he says, by sea-traffic, not by land, for the nomad barrier was still unbroken. He urges, and in this he has been anticipated by Vivien de St. Martin and by Sir H. Rawlinson, that the *Chinas* of the Indian books (the Laws of Manu and the *Mahābhārata*) had nothing to do with China. Their association with the *Darada*—the *Daradae* of Ptolemy, the race of modern Dardistan or Gilgit—and other particulars, show that they really belonged to the basin of the Upper Indus, where the name of *Shinas* is not yet extinct. In fact the vast Highland of Tibet, and the wild races that man its ramparts on the east, excluded China from all direct access to India. It was only in the century preceding our era, and by the circuitous line of Bactria, that the Chinese learned the existence of India as a rival seat of culture. When the knowledge of the Western markets had dawned upon them they sought to find a direct road to these through India. These efforts led to the discovery of Burma, and, curiously enough, to the annexation of the southern provinces of China; but, though some little traffic in silk made its way, as we gather from allusions in the *Periplus*, all efforts to penetrate in force to India were vain.

To Ptolemy's *Serica* we think Riechthofen gives too much space; its data are too loose for much discussion. Nor can we attach so much value as he seems to do to the geography of that part of Asia as given in Ammianus. I think it will be found that here the Latin writer speaks without original information, and is only converting the dry data of Ptolemy's Tables into fluent and "graphic" description, as the skeleton telegrams of Indian correspondents occasionally (it is said) undergo a like manipulation by deft fingers in the Strand.

Our author's discussion of the *Sinæ*, and with it of the real origin of CHINA, is especially valuable, and his connexion of the name with that of *Jinan*, which the Chinese in the early centuries of our era record as that of Tongking, is, I think I may say, convincing. When we consider the facts about this name *Jinan*, that the territory so called constituted for four centuries (from B.C. 111 to A.D. 263) a province of the Chinese Empire, that there was a western trade to *Kattigara*, a port of the *Sinæ*, and that

there is undoubtedly a difficulty in carrying the position of this port, as indicated in the data of Ptolemy (*i.e.* of Marinus), so far east as China Proper, we cannot but recognise the satisfactory character of the interpretation—viz.; that the real *Regio Sinarum*, or *China*, was *Jinan* or Tongking, a province of the great Empire, and that the name of this province, and outpost of the Empire towards western access by sea, was naturally applied by the Westerns, who so approached it, to the whole nation and empire of which they heard reports. The envoys of Marcus Aurelius, *Anton* of the Chinese annals, are recorded in the latter to have arrived by way of *Jinan* on their way to Court. Had any corresponding record been preserved in the West, no doubt it would have run in some such words as—*Caesaris legati in portum Sinarum advecti regiam petunt*.

The review is carried on to the present day with unflagging interest and pregnancy of remark. In that part which treats of the services of the Catholic Missions to Chinese geography we may point to the author's spirited sketch of the differences between the Jesuits and the other Orders (pp. 657 *seqq.*). The history affords a singular example of the contempt with which the Jesuits found it possible to treat the Holy See when adverse to them. But we would rather have quoted, if space would permit, a passage, delightfully corroborative of a view expressed elsewhere by the present writer,* on the character and services of that estimable Jesuit and beloved geographer P. Martin Martini (p. 674).

We must here part with one of the greatest geographical works of this century, utterly dissatisfied with the inadequacy of this notice, and inclined to wish that we had replaced it by merely translating the powerful and comprehensive "Retrospect" with which the volume closes. All the variety of matter with which the book deals is handled in a style full of interest, and remote, except in the occurrence of an occasional complex piece of syntax, from all that popular prejudices attribute to German exposition. The tone of the book is high and noble. Though often dealing with disputed questions, it is unfailingly candid and generous; though it contains many able critical remarks, and indications of the characteristics of writers, past and contemporary, there is (as far as we can see) no sentence that leaves a sting. Germany may well be proud of such a traveller, and the Geographical Society of Berlin is fortunate in such a President. H. YULE.

The Prophets and Prophecy in Israel. An Historical and Critical Enquiry, by Dr. A. Kuenen, Professor of Theology in the University of Leyden. Translated from the Dutch by the Rev. Adam Milroy, M.A. With an Introduction by J. Muir, Esq., D.C.L. (London: Longmans & Co., 1877.)
Een studie over de Geschriften van Israël's Profeten. Door Dr. A. Pierson. (Amsterdam, 1877.)

IN estimating Dr. Kuenen's monograph on the Prophets, we must bear in mind that the

author had two more or less distinct objects in view in writing it. In the first place he desired to enrich the literature of Old Testament criticism and history by a more complete, comprehensive, and compact account of the nature, the genesis, the function, and the results of Hebrew Prophecy than had as yet been given. No one can doubt either the importance of this task or Dr. Kuenen's eminent qualifications for its performance.

But, in the second place, *The Prophets and Prophecy in Israel* has a distinctly controversial object, which is allowed to dominate its arrangement and structure almost from the first page to the last. It is distinctly and avowedly an appeal to the orthodox to reconsider their position with regard to the remarkable phenomenon with which it deals, and an attempt to drive them by cogency of fact and logic to adopt without reserve the "organic" or "historical" conception advocated by the author.

That this polemical object is in itself worth pursuing few will be inclined to question. Biblical students are perhaps too prone to neglect that large mass of intelligent and enquiring readers who are not in any way "committed," and who are offended or repelled by the manifest superciliousness with which orthodox and heterodox critics alike dismiss or ignore the arguments of their opponents. Authors of either school very naturally write in the main for those who accept and understand their methods and general position, and are therefore prepared to follow them sympathetically; and consequently they treat the arguments of their opponents in a spirit and from a point of view wholly foreign to that from which they are uttered, thereby delighting their followers but only rousing the contempt or exasperation of their opponents, while those who are neither followers nor opponents are annoyed by what appear to them the colossal assumptions they are constantly called upon to make, and the habitual unfairness or capriciousness with which the arguments are conducted. In reality these harsh judgments on the part of readers are themselves unfair; for writers cannot be everlastingly returning to first principles, and indeed those who have already decided in their own minds what should be the main principles of investigation have a right to demand that, as a rule, their leaders should conduct them by the shortest roads to fresh developments and results, only dealing incidentally with the objections urged from a wholly unsympathetic point of view if they happen to occupy ground of which they can naturally take cognisance.

But this necessary condition of the fruitful prosecution of researches makes it all the more desirable that the fundamental questions should not be neglected, but should be constantly rediscussed in the light of the results respectively arrived at by the advocates of rival principles of investigation; and this, too, in the interests alike of the sturdiest champions of the opposing methods and of that enormous mass of waverers who do not like to say either "yes" or "no," and "sigh to think they cannot utter both!"

And if such a discussion of the funda-

mental questions of Biblical criticism—of which prophecy is undoubtedly one of the foremost—is in itself desirable, no one who is acquainted with Dr. Kuenen's works will question his special qualifications for undertaking the task. In the first place, his undoubted mastery, not only of the subject-matter itself, but of all the varied literature that has clustered round it, places him in a position in which he has few rivals. Again, it must be regarded as an advantage that Dr. Kuenen is what is called in this country, at least, rather an extreme man, and has fearlessly pushed his views to their legitimate conclusions. This fact will save the discussion from ambiguity and barren vagueness. Lastly, and chiefly, those who have read the "Religion of Israel," and those masterpieces of controversial criticism, the author's essays in the *Theologisch Tijdschrift*, will readily admit Professor Kuenen's peculiar power of making his position clear to those who are not initially in sympathy with it, and of arresting and exhibiting in palpable forms all those minute facts and subtle influences which contribute to the formation of impressions but generally defy analysis. It is the peculiarity of Kuenen's argumentative style that he begins by completely identifying himself with his reader's presumable attitude of mind, and then so arrays the facts before him that he finds himself anticipating the conclusion to which he is being led, and half inclined to regard it as a discovery of his own.

With such qualifications Kuenen undertakes the task of leading on the quasi-orthodox believer who still clings to the "supernatural" interpretation of prophecy to the firmer ground of the "historic" view. The method of his book is in every way characteristic. He begins by a brief sketch of the traditional view of prophecy, a sketch which has rarely been excelled, we should imagine, in simplicity, force, and grandeur. To this he opposes a bare statement of the "organic" view which he cannot at this point paint in richer colours. He goes on to confess that the innovators have not yet, point for point, met the arguments of the traditional expounders, but to prove by copious extracts from the works of the latter that they have themselves abandoned many a position once considered vital. Hence follows the opportuneness of a renewed investigation, to the method of which together with certain preliminary and provisional discussions the next three chapters (ii.-iv.) are devoted. Then comes a detailed and conscientious examination of every single prediction contained in the prophetic writings (chapters v.-viii.), in which the precise intention of the prophet in each instance is, as far as possible, ascertained, and then confronted with the actual event. The laboriousness and completeness of this investigation can only be appreciated by those who study the book itself. Suffice it to say that, so far as we are aware, it stands entirely alone, and not only shows signs of being the result of much labour on the part of the author, but is likely to be the cause of much labour in others—should any orthodox champion be bold enough to undertake an answer. To many readers these chapters will be wearisome, but the main result is

* See *Geographical Magazine*, 1874, pp. 147, 148.

overwhelming. In detail Prof. Kuenen's results may often seem, to defenders of the old hypothesis, to be less certain and less conclusive than he represents them, but it is difficult to imagine any candid reader permanently resisting the total impression without a very marked change of front. For those who have already relinquished the supernatural position the chapter that follows next (ix.) will appear in every way the most important in the book. Here the relation is discussed between the prediction of the future and the religious belief of the prophets of Jahveh, and it is shown with admirable clearness and cogency, 1, That the prophetic predictions were conditional and not absolute; 2, That they were dependent upon the prophet's conception of Jahveh, and were, in fact, mere concrete applications of general principles. Hence the comparative indifference of the prophets in the face of the non-fulfilment of their predictions and their unshaken confidence in their own mission. The flood of light which this chapter throws upon the prophetic consciousness cannot be in any way appreciated from this bald statement, but no student can afford to ignore it. We regret all the more the only serious blemish we have noted in the book, namely that the reader is left to reconcile as best he may the results of this chapter with the phenomena set before him in chaps. x.-xiii., which deal with the representations of the prophets in the historical books. Here it would seem that in the minds of the prophetic historians prediction was all in all. The contradiction is probably more apparent than real, for even in the historical narratives prediction, on closer inspection, is seen to be generally subordinated to purposes of present warning or encouragement, but the fact remains that far greater stress is laid on the predictive element in prophecy than we should have expected. The remaining chapters deal with the "Unhistorical Explanation" and the "Spiritual Fulfilment" of the prophecies in the New Testament (xiii., xiv.), and the general results of the whole investigation (xv.), from which it appears that *ethical monotheism* is the distinctive creation of the prophets of Israel.

At the conclusion of this work we are compelled to admit that the polemical element and "motive" largely preponderate. The student who already agrees with the author as to method and general results will find much of great value in this book, but some of it he will have to glean over a wide surface. We therefore ask with all the more interest what is likely to be the effect of the perusal of this work by those who do not accept, to begin with, its view of prophecy. That it will ultimately produce a very powerful effect, and that future apologists for the supernatural explanation cannot and will not ignore it, and yet will experience extreme difficulty in dealing with it, we hold to be certain. And yet we very much question whether its effect will be as great, or at any rate as rapid, as a sympathising reader might be inclined to expect. Is not the fact simply this, that the task apparently undertaken in this work is intrinsically and essentially impossible? The attempt to isolate a phenomenon such as Hebrew prophecy, and

judge of it exclusively on its own merits, *without any predisposition to regard one result as more antecedently probable than another*, must by its nature fail. And yet it is well to make it and carry it out to the utmost limits of possibility. This Prof. Kuenen has done. He has shown, conclusively to our mind, that the view of prophecy demanded by the general state of historical, scientific, and philosophical knowledge of to-day finds many-sided support within the prophetic writings, gives an adequate account of the phenomena of prophecy, and encounters no single difficulty that it cannot surmount. He has shown, moreover, that the traditional view is more or less incoherent and wavering, and in all its forms meets with insuperable and unequivocal contradiction within the prophetic writings. But conservative readers will feel that in attempting the further task of showing that their view is not only opposed by many facts, but finds no real support in any, Prof. Kuenen is influenced by a strong conviction (which they by hypothesis do not share) of the *antecedent improbability* of their opinion. We have hinted above that he comes to the enquiry with the belief that his own solution of the problem is demanded by facts and principles that do not come within the scope of the present enquiry. This conviction, evenly distributed and unintermitting as the pressure of the air, runs throughout the book, steadily pushing us to the conclusion and insensibly intermingling with the discussion of every problem. The author's critical conclusions, for instance, as to the age of the prophecies are assumed in this work; and they are certainly influenced by the consideration now pointed out. We do not mention this as a fault in Kuenen's work. It is strictly inevitable; and, moreover, it has been minimised by our author in a manner that cannot fail to excite our admiration; but, nevertheless, it marks the weak side of all such attempts as this. They go deep into the discussion, but they do not go to the bottom of it. They attempt an impossible isolation of a single group of phenomena, and fail more or less conspicuously to maintain it. At every point the influence of more general conceptions makes itself felt. The most that can be done is to show that those general conceptions find support in the special field of investigation that is being examined, and it is vain to imagine or pretend that they were not imported into the study but elicited from it. All this we believe Prof. Kuenen himself would be the first to acknowledge, and a clear perception of its truth has probably prevented his forming any exaggerated anticipations as to the immediate effect of his book. Meanwhile he may rest assured that it will be a permanent and growing force tending to reclaim for the "organic" view of history the literature and the people of Israel, and giving to prophecy, now that it has lost its traditional place in the ancient drama of redemption, a yet nobler part to play in the yet grander drama of human progress and religion.

We have not met with any serious attempt from the orthodox side to answer Kuenen's work, and indeed no champion who felt the gravity of his task would rush so

soon into the field. But from the extreme left Dr. A. Pierson has couched his wandering lance and tilted at his old friend and foe with his usual rapidity of movement and uncertainty of aim. His little book—or big pamphlet—is not really a study of the prophets, but an attack upon theology, and an attempt to show that Kuenen is too much biassed by his own theism to be able to take an impartial view of the prophets. Dr. Pierson himself confesses that he could never read a page of any of the prophets without finding his attention wandering unless forcibly held to the task, and rejects on grounds that appear to us very frivolous the whole of Jeremiah's biography. Dr. Pierson is too clever to write without being occasionally suggestive and instructive. His glowing but highly unfavourable picture of the "passion of Jahveism" (pp. 108-9) will be read with interest; his destructive criticism of the history of the prophets is occasionally (but rarely) incisive; he finds one or two weak points in Kuenen's armour, pointing out, for instance, the imperfect junction of chapters ix., and x.-xiii., dwelt on above, and his gloomy views of life are put forward with a touch of that weird and mournful pathos, that metaphysico-poetical devoutness of combined scepticism and idealism, with which his readers have long been familiar; but, properly speaking, his work demands no notice from us except as the only answer to Kuenen of any kind which has come under our notice during the considerable period we have allowed to elapse since the publication of his work.*

We have only to add a word of appreciation of the way in which Mr. Milroy has performed his task as translator. He has generally made his sentences flowing, and always intelligible; while so far as we have observed his renderings are remarkably faithful.

PHILIP H. WICKSTEED.

NEW NOVELS.

The Last of the Haddons. By Mrs. Newman, Author of "Too Late," "Jean," &c. In Three Volumes. (London: Samuel Tinsley & Co., 1878.)

Frank Raleigh of Watercombe. By the Author of "Wolf-Hunting in Brittany." (London: Chapman & Hall, 1877.)

Lawrence Loftwalde. By Arthur Hamilton. In Three Volumes. (London: Samuel Tinsley & Co., 1878.)

The Missing Will. By Herbert Broom, LL.D. In Three Volumes. (London: Chapman & Hall, 1877.)

Play or Pay. By Hawley Smart. In One Volume. (London: Chapman & Hall, 1878.)

A Chaperon's Cares. By Mary Catherine Jackson. In Two Volumes. (London: Smith, Elder & Co., 1878.)

Vanessa Faire. By George Joseph. (London: Samuel Tinsley & Co., 1878.)

MRS. NEWMAN's style has strengthened since she wrote *Jean*. *The Last of the Haddons* is a quieter and calmer story, but far more

* Since the above notice has been in type an important and constructive criticism of the two works it deals with has appeared in the *Tijdspiegel* from the pen of Dr. Oort, but space forbids our doing more than call attention to it.

interesting from its greater fidelity to real life. The heroine who tells the story is at a disadvantage from the autobiographical form of it. But she really is a nobly unselfish woman; and the way in which she passes this over, and represents her life of self-denial and self-suppression as perfectly natural, is very skilfully worked out, and gives a reality and truth to the story that goes far in creating the illusion which should be one of the chief aims of the novel as a work of art. The plot is not a very natural one in some of its details, but these are subservient to the main idea of the story, which is to show that a woman may give up all that outwardly constitutes the happiness of life, and, devoting herself entirely to the good of others, may become, not a suffering martyr, but a cheerful member of society. Mary Haddon, the heroine, spends the interval between her engagement and the time of her marriage as companion to a young heiress. Philip Dallas, to whom she is engaged, is in Jamaica during this period. Lilian, the heiress, discovers at her father's death that she has a sister who has hitherto been supported by her father unknown to her; and with generous impulse she immediately brings her away from the home where she is living in charge of her aunt, the wife of a shoemaker, and shares her fortune with her. But Marian, whose mind is essentially vulgar and selfish, turns out to be the legitimate heiress to all the wealth, and ousts Lilian, at the same time robbing her of the loyalty of the man to whom she was shortly to be married. The calm unmoved selfishness of Marian is well drawn, and she is a more effective picture than Lilian, who is, as we are told more than once, "beautiful with all the soul's expansion" (a quotation which seems such a favourite with the authoress that it is applied to different people twice on the same page). Mary Haddon is faithful to the fallen fortunes of her charge Lilian, and retires to a small cottage with her. Here in the course of time comes Philip Dallas to claim his bride; and the sequel would be sad and dreary enough were it not redeemed by the cheeriness and unostentatious magnanimity of the heroine, whose conduct at the wedding which should have been her own is worthy of the highest admiration. It would have been pleasant to know that she finally rewarded the faithfulness of Robert Wentworth, but the story is perhaps more natural as it is. We could have wished that some exaggerations, as for instance the conversations of Lilian's father, and Mary Haddon's interviews with the girl Nancy and the housekeeper of Robert Wentworth, had been toned down; but the story as a whole is interesting, pleasant, and healthy, though here and there the style of composition is faulty, and gives evidence of undue haste.

We are informed on the title-page of *Frank Raleigh* that it is a tale of Sport, Love, and Adventure; and certainly it is an extraordinary jumble of all three, but the sport has the best of it, so that we are made to feel that the love is only part of the sport, and ought never to be regarded in any other light. A person less fitted to be the hero of a book than Frank Raleigh it would be

hard to find. He is introduced to the reader as a schoolboy, and certainly he is a most precocious one. He feigns fainting when the master of his school boxes his ears with a dictionary; he gets away from school for a day, and manages to lose his way, and stays out all night on the moors. When he is rescued and is being taken back to his schoolmaster by the country doctor, he suddenly hears that his father's otter-hounds are to meet in the neighbourhood, whereupon he takes another day for otter-hunting. When he is given a book of the *Iliad* to write out as a punishment, he endeavours unsuccessfully to bribe the half-starved curate to do it for him. He is finally expelled for keeping a coracle, and apparently poaching, and then, instead of going home, he stays on the way to make love. Before he is twenty he is engaged, against his father's wishes. He then goes to Oxford, while waiting for his commission, so that "if he did not study, he might mix in good society and be mentally improved by the very atmosphere of the place." He carries out his mental improvement by running deeply into debt, having some excellent hunting, and being finally expelled. He then goes to Wales, where he gets some polecat-hunting, and at last to Africa, where he has adventures with lions. So much for the "sport and adventure" of the story; the "love" had better have been left out, for it is not competently handled. After having bestowed all the valuable affection which he could spare from hunting, since earliest boyhood, on Mary Corbet, Frank suddenly breaks off his engagement with her, because he fears that her mother is going to marry his old schoolmaster, and even when assured that this is not the case, his conduct is quite unworthy of a man who would "ride straight." He marries and leaves his wife at the church, never seeing her until he finds her at the opera ten years after, when "they met and never parted again." It is a novel the merits of which sporting-men alone will be able to find out; but it is a less confusing one to the mind than *Lawrence Loftwalde*, where we are at once launched into a hopeless struggling mass of gipsies and smugglers who seem to be for ever clutching each other's throats. The story assumes no distinct form until the third volume, when it appears that it turns on the identity of a wandering showman who has dragged his long sentences through the two preceding volumes, and finally tells his tale in very fine language. The scenes are violent and exaggerated; as, for instance, where the baronet who wrongly holds the estates of the showman hits a ruffian who wants hush-money on the head with a candlestick, and then taking the apparently lifeless body to the window heaves it out, from all which bad treatment the ruffian recovers so as to be able to denounce his enemy in court where he is himself being tried for murder. In the course of the trial,

"he vaults over the dock's high railings, descends on the barristers' table, skims its surface like a swallow and clutches at the sheriff's collar. The sheriff stabs him with a dagger, and the ruffian glares at him for a moment, and then lifting his

heavily-ironed hands brings them down upon the other's head with terrific force. The sheriff falls forward a corpse . . . The judge faints at the sickening sight,"

and the hangman is the only person who has the presence of mind to come to the rescue. The author says he is "but a lisping babe in the republic of letters," but if he ever means to talk plainly he will have to alter his style; neither must he talk of a tear on the eyelashes of a dead man, "bright, translucent, gemmy," nor of "the blackbird pouring its throat," &c. &c., for if he does he may win "the hearty laugh" which he covets to raise, but it will be some time before he "brings forth one genuine tear."

The author of *The Missing Will* has a taste for architecture and for old china, and does not at all mind turning aside from the main point of his story to talk about both. The story itself is not strikingly original, for we have heard before of a will being burnt, and the wrong person enjoying property in consequence until Nemesis comes in the form of another copy of the missing document; and there is not any remarkable originality in the way in which the characters of the story are affected by these events. Ladies' dress is another subject about which the pen of Herbert Broom, LL.D., waxes eloquent. He tells us that "the bridesmaids—nine, an unusual number—were dressed in threes, and walked after the bride in threes, the centre aisle of Errington church being exceptionally wide. They were in white and cerise, with crab-blossom; white and violet, with pansies; white and blue, with primroses. It must be confessed that the absence of all expanding of dresses in the year of grace 187—makes it more difficult to give the pretty light effect to them which was so easily achieved when everything was fluffs and puffs." This is an average specimen of the lighter parts of the book, and for its graver style—for it has a graver style—we may quote the following: "Reader! hast thou ever known the influence of blank and absolute despondence? How it seems to brood like darkness that may be felt over every mental energy—how it seems to stupefy the senses—how it seems to render opaque the moral vision? Thou hast not felt such despondence? And heaven grant thou never mayst!"

Play or Pay is a short racing story; which from its free and easy style and its daring assertions about society in the present day, would have astonished our ancestors; but there is something amusing and bright about it which will carry all readers to the end. They cannot fail to feel some interest in the fair-haired hussar, who loses at cards the legacy which he intends to spend on horses, and is pledged for the honour of his regiment to ride, and not only to ride but to win a certain steeple chase on which there are heavy bets. Bertie Bazing's courtship, too, is naively described, and we think Mr. Hawley Smart may lay claim to originality in his description of the moment of his hero's engagement. "Be my wife, Pollie," he says to the frank, honest country girl who has won his heart. She answers: "If you wish it, Bertie," and softly steals out her hand adding, an instant after, "look,

Bertie, quick,' as she pointed to a woodcock stealing quietly away from the adjoining ditch. Of course, under the circumstances, Bazing ought to have been too agitated to shoot at all. I regret to say that he tumbled that unhappy cock over most artistically, and that his *fiancée* exclaimed, 'Bravo, Bertie!'

We sincerely sympathise with the chaperon who had the care of such exceedingly unpleasant young ladies as are portrayed in *A Chaperon's Cares*. One of them marries for money and is supposed to poison her husband; the other breaks the heart of an only son and has a bad temper. The story is not a pleasant one, though it is written smoothly and with some cleverness.

Vanessa Faire is a novel of the sensational order, crowding together elopements, and revenges, and wills, and hidden relationships in a bewildering way. The author takes gloomy views of men and morals, and indulges in misanthropical remarks about "this wilderness world," this "phantom dance of a lifetime," &c. Every here and there we find touches of humour and of talent in description, both of scenery (as of Marndyke, the gaunt weedy-looking house that seemed to have outgrown its strength), and of character (as John de Ferronnays, who made up his mind to rise, and had risen, "with a sister living in Camden Town who gave him half her little income—and he spent it"). And these touches make us regret the bad taste of such scenes as that of Mary's mesmeric trance and Arthur Murray's death-bed. The book is an unhealthy one and not agreeable. F. M. OWEN.

CURRENT LITERATURE.

The Life and Letters of Edmund J. Armstrong. Edited by George Francis Armstrong. *The Poetical Works of Edmund J. Armstrong.* Edited by G. F. Armstrong. *Essays and Sketches of Edmund J. Armstrong.* Edited by G. F. Armstrong. (Longmans.) These are the memorials of a life brief and vivid. In his twenty-fourth year E. J. Armstrong died; from early childhood until his last illness he seems to have lived at a high pressure, forced upon him by no external circumstances, but by the expansive power of the spirit within him. His life had in it material enough for two lives of the same length—frolics of boyhood, the growth of a passion for external nature, ardent friendship, an unsatisfied love, the loss and restoration of a faith, authorship, in prose and verse, all these filled to the full his narrow count of years. Passages of his history show a morbid element either in his character, or in the growths of certain particular periods; but his fund of humour, apparent through his letters and poems, was one pledge, among others, that he would work his way to sanity through any temporary extravagance of feeling. Edmund Armstrong was born in Dublin in 1841. Suffering from excess of study when an undergraduate, he wandered in France and among the Channel Islands in search of health, read and wrote with extraordinary energy, returned to Trinity College, obtained a foremost place among his fellow-students, and then was seized by his fatal malady. A considerable portion of the memoir is occupied with letters which give the history of a young man's transit from an "Everlasting No" through a "Centre of Indifference" to what became for him an "Everlasting Yea." This is diversified with pleasant open-air sketches of Norman and of Irish landscape and people. The editor has done

his work well, with all reverence and love for his dead brother, and with many lively and tender touches of his own. It is impossible here to speak adequately of E. J. Armstrong's Poems. They are something considered as an achievement, but more as a promise. Lyrical, dramatic, and narrative, they exhibit considerable mastery of form; they betray a passionate temperament (often craving repose) and a vigorous, if sometimes unchastened imagination. That these volumes should contain crudities is natural; what is remarkable is that they should contain so much work which, while youthful, is yet, in its way, more than tentative. The prose writings seem to us less interesting than those in verse; but a paper on the history of the English essay contains some brilliant writing.

The Mount: Speech from its English Heights. By Thomas Sinclair, M.A. (Trübner.) The Mount is that divine height on the twin peaks of which sit Shakspeare and Mr. T. Sinclair, M.A., bathed in the glory of a spiritual dawn, while purblind men of science and the whole race of miserable critics grope among the valleys and are lost. If Mr. Sinclair would for a while try to forget that he is a genius, if he would dismiss his intuitions, and set about some good piece of plain work, which would task his understanding and common-sense, perhaps he might afterwards return to his genius and his intuitions, and put them to some wise use. For he has a nimble wit enough (no uncommon possession), and light, not broad and even, but showing itself in long narrow pencillings, does illuminate his book. It must be an unhappy position to be so much wiser and more inspired than one's contemporaries: the solitude of the "Mount" must be oppressive. Yet Mr. Sinclair does not seem to suffer, and deals out jauntily his transcendental aesthetics. The higher order of intellects and imaginations work in a different fashion. Mr. Sinclair may yet accomplish something of value; but he must begin by utterly abandoning this off-hand manner of cheap genius.

George Eliot and Judaism, an Attempt to appreciate "Daniel Deronda." By Prof. David Kaufmann. Translated from the German by J. W. Ferrier. (Blackwood.) The omniscient critic declared with emphasis that the Mordecai part of *Daniel Deronda* was moonshine. The idea of Jewish unity, and especially the idea that the nation should once more possess a local habitation on our globe—these were dreams of an excited visionary, and accorded ill with the real part of George Eliot's novel. Grandcourt was unquestionably real; Mordecai was no better than a phantom. Meanwhile evidence has been forthcoming that in the living heart of the Jewish people a deep chord was struck by precisely what English reviewers pronounced the whimsical or visionary part of *Daniel Deronda*. The present essay by Prof. Kaufmann, of the Jewish Theological Seminary, Buda-Pesth, is one of several pieces of evidence that George Eliot was right, and her critics in error.

"It may be boldly maintained that the Judaism of to-day is awakening to, and strengthening in, national self-consciousness. . . . The fact cannot be denied that for the greater portion of the Jews, Palestine is something more than a geographical notion. . . . Advanced culture and noble magnanimity are not yet too tired to prove by deeds their readiness to sacrifice themselves for that country and its inhabitants, and to step forward for the preservation of places upon which the adoration of three religions, but above all the heart and soul of Judaism, is fixed. Who will venture to predict what may one day be brought about by the flood-tide swelling in the Jewish race? Who will venture to maintain that the imponderable mass of indefinite forebodings and mysterious impulses, which has increased rather than diminished in the soul of Judaism while the centuries have run their course, will vanish into air without having achieved result?"

The Lectures of a Certain Professor. By the Rev. Joseph Farrell. (Macmillan.) The pro-

fessor is "Professor of the Inexact Sciences," and his lectures are meditative essays about many things—about Books, and Culture, and Happiness, and Success, and Illusion, and Knowledge of the World, and kindred themes. The reader is not to look for knowledge from this book; but rather for a measure of wisdom—the wisdom of a pure, refined, tender, cultured nature, which holds in reserve a certain quiet strength under its tenderness. Mr. Farrell broods over his thoughts, is leisurely, goes to this side of his subject or to that as it happens to attract him. It is not every reader who will consent to be detained while the professor discourses of this or that, not always caring to be novel in view, and never being roused out of his quiet manner. And Mr. Farrell himself is doubtless tolerant enough to sympathise with the impatience of a reader who desires that intellectual and moral force should amass itself, and that ringing blows should be struck upon the anvil of the mind. But another kind of reader, who can spare time to be at ease with a quiet book, will find his own thoughts stirred—perhaps stirred vaguely—by these discourses, and he will set about approaching old truths of life with a quickened spirit until commonplaces of experience seem to acquire a fresh significance. The meditative essay is not in fashion with us at the present day; we demand accumulated facts or progression in a definite direction. But some of the great elementary facts of life are immovable, and we can only go about and about them. Mr. Farrell would gain by aiming at greater selectness, so as to dismiss inferior thoughts, and to illuminate his best thoughts with an exquisite expression. It would be easy for his present style to degenerate into the vapid or the bland edificatory style. Perhaps the tone of elderly moderation in Mr. Farrell's writing is a token that he is still far from elderly, and that we may look for future lectures from him, possibly on some exact subject. Why not on his favourite Cervantes and other writers of his choice?

History of English Humour, with an Introduction upon Ancient Humour. By the Rev. A. G. L'Estrange. In Two Volumes. (Hurst and Blackett.) We came to these volumes desiring to bless, for the subject is an admirable one; we stay to curse, for the treatment is miserably inefficient. Neither scholarship, critical insight, nor power of philosophic thought is to be found in this *History of English Humour*, nor even a tolerable prose style; we find in it only evidence of rambling and inaccurate reading. It would be a waste of power to amass the blunders of the book; the general inanity of the criticism will not exhibit itself without a longer extract than we are disposed to make. But the following short deliverances may serve as a measure of the qualifications of Mr. L'Estrange to write a history of English humour. "Scarcely any part of Chaucer's writings would raise a laugh at the present day." "How seldom do we hear any of Shakspeare's humorous passages quoted, or find them reckoned among our household words. From some of his observations we might think he was altogether averse from jocosity. Henry V. says 'How ill gray hairs become a fool—a jester.'" "Occasionally there is some sparkle in Pope's lines" (remarkable discovery!). "A bright fancy runs like a vein of gold through nearly all Swift's writings." "Fielding's turn of mind was decidedly cynical."

The Works of Sir Henry Taylor. Author's Edition. Vol. IV. "Notes from Life;" "The Statesman." (O. Kegan Paul and Co.) With this fourth volume begin the prose writings of the veteran author. If it be true that his poetical works have not yet obtained the reputation they deserve, it must further be admitted that these essays, originally published in 1836 and 1847, still remain almost unknown to the general public. Nor are the public entirely to blame for their indifference. The tendency to sententious moralising which has sometimes been criticised as spoiling the living interest of the dramas is here

developed in its natural medium of bald prose, without any adventitious aid of plot or history. Sir Henry Taylor's professed object was to "present in the form of maxims and reflections the immediate results of an attentive observation of life." Such a form of composition, which manifestly owes its original stimulus to the Essays of Lord Bacon, has so long passed out of fashion that it is difficult to realise that the writer is yet with us. The present generation is, above all things, not contemplative. By reason of the growing predominance partly of physical science and partly of journalistic literature, our attention is too much absorbed either in the truth of facts or in the novelty of events. We have lost the habit of pursuing curious trains of thought for ourselves, or accepting instruction in practical matters from the mature experience of others. But if there be any readers sufficiently old-fashioned to take pleasure in a genial exposition of certain leading aspects of human nature, we can commend to them Sir Henry Taylor's "Notes of Life," many of which are now published for the first time. Originality, in its strictest sense, they will not expect; but the general matter and the turns of thought are characteristic of one who has diligently combined the practice of literary composition with the duties of public life.

A Practical Guide to the Law of Landlord and Tenant, by George H. Larmouth. (Manchester: John Heywood.) This is not so much a legal handbook, as the suggestions of a house-agent addressed to that large class of persons who delight in having amateur dealings in house-property. Such people are the natural prey on the one hand of property jobbers and speculative builders, and on the other hand of defaulting tenants. Mr. Larmouth evidently writes with considerable knowledge of the risks to which his clients are exposed, and he supplies interesting information concerning the cost of managing house-property. But his strong point does not lie, as he seems to imagine, in real-property law.

NOTES AND NEWS.

SIR JOSEPH HOOKER, Pres. R.S., and Mr. John Ball, F.R.S., have, we are informed, put into the hands of Messrs. Macmillan and Co. for publication the journals kept by them during their visit to Morocco and the Great Atlas in 1871. The volume will also contain a sketch of the geology of Morocco by Mr. George Maw, F.G.S. The illustrations will be prepared by Mr. Edward Whymper from materials supplied to him by the authors.

MR. SKEAT has kindly undertaken to edit for the Early English Text Society a photolithographic facsimile of the unique manuscript of our earliest Anglo-Saxon poem, *Beowulf*, in the Cotton Collection in the British Museum. Though the MS. has been damaged by fire, its leaves have been very skilfully smoothed and mounted, and will yield good copies. Mr. Skeat will transliterate and translate the original, add collations of the best modern editions of the text, and write a critical introduction to it, and notes and glossary. Mr. Skeat has also made considerable progress with the new Lexicon of English Etymology, for which he has been long collecting materials, and which he is now preparing for publication by one of the most important publishing bodies in the kingdom.

DURING the later years of Auguste Comte's life it was among his most cherished objects to establish a periodical devoted to the propagation of Positivist principles. The disciples of the faith which he founded now feel themselves in a position to carry out his desires; and with characteristic piety they have resolved to adopt the name of *Revue occidentale*, which Comte himself had selected. The editor is M. P. Laffitte, the recognised head of the Positivist society which has its home

in Paris at 10 rue Monsieur-le-Prince, the house in which Comte lived and died. In his editorial duties M. Laffitte will be assisted by a committee, of which Dr. Dubuisson is the secretary; and contributions will be supplied by the adherents of Positivism in England, America, and Sweden, as well as by the French members. Each number of the *Revue* is to be divided into three parts. The first will consist of a discussion of recent events, political, social, and intellectual; the second will comprise a series of original essays; while the last part will be a publication "des actes officiels émanant de la Direction du Positivisme." The *Revue occidentale* will appear every alternate month, and the first number is already in the press.

MESSRS. TRÜBNER are about to publish the second part of Mr. G. J. Holyoake's *History of the Co-operative Pioneers of Rochdale*. The first part, which told their story from 1844 to 1857, has been translated into most continental languages. The second part brings down the narrative of their remarkable success twenty years later—namely, from 1858 to 1878. The new part is dedicated to the Rev. William Nassau Molesworth.

We have received some specimens of Easter cards from Messrs. Marcus Ward and Co., which show progress in ingenuity and colouring, even as compared with those upon which we had occasion to report favourably last year.

We understand that Mr. Walter W. R. Ball, Fellow of Trinity College, Cambridge, has in the press a *Student's Guide to the Bar*, in which he has given a brief outline of what the student must do to become a barrister, what prizes are open to him, and what course of study and preparation is usually adopted. The volume will shortly be published by Messrs. Macmillan and Co.

THE Parallel-Text edition of the Devonshire *Hamlets* having been for some years out of print, the Duke of Devonshire has, at Mr. Furnivall's request, authorised a fresh reproduction, this time by photolithography, of his copies of the two first *Hamlet* quartos, 1603 and 1604, besides some other first quartos. It is believed that the books can be reproduced at a price that will put them within the reach of every student, say 6s., and it is hoped that the number of subscribers who will support the scheme will enable it to include all the first quartos of Shakspeare, and all the rarest and best early plays and tracts. The reproductions of the books will be done by Mr. W. Griggs, long the photolithographer of the India Office, under the general superintendence of Mr. Furnivall, and the Introductions to them will be written by Mr. Furnivall, Mr. P. A. Daniel, Mr. T. Alfred Spalding, and other editors of the New Shakspeare Society. The *Hamlet* quarto of 1604 is already in hand, and the work will be pushed rapidly on.

A FULL notice of the life and works of M. Camille de la Berge, whose death we have already announced, appears in the *Revue Critique* of April 13.

MESSRS. MACMILLAN AND CO. will shortly publish a small *Manual of Practical Chemistry*, by Mr. M. M. Pattison Muir, Praelector in Chemistry, Gonville and Caius College, Cambridge. The object of the book is to supply a guide to the medical student in his study of practical chemistry. With this view the author has so arranged the facts and the methods that what the student does he may do thoroughly, that he may learn as much as possible during his necessarily limited course, and that he may lay the foundation for future work should he have time and inclination for such work.

M. ARTHUR HEULHARD, editor of the *Moniteur du Bibliophile*, 34 rue Taitbout, Paris, has nearly completed a work of much importance for the history of men and manners on the stage, entitled *Jean Monnet, histoire et aventures d'un entrepreneur de spectacles au XVIII^e Siècle*. This Jean Monnet left Paris for London in 1749, at

the head of a troupe of comedians, and gave a few representations of French pieces at the Haymarket Theatre, which were played to very tumultuous audiences, and which gave rise to (1) libels, memoirs, and pamphlets for and against his enterprise; (2) controversies in the newspapers, especially the *Daily Advertiser*; (3) caricatures and drawings. M. Heulhard would be greatly obliged to any of our readers who could furnish him with any information on this subject, at the above address.

THE first edition of Miss Bramston's novel, *Em*, having been exhausted, a second one will be shortly issued by Messrs. Marcus Ward and Co.

AMONG the miscellaneous charters in the British Museum is one which attracts notice from its connexion with a people whose name is at this moment in every mouth. It records the sale of a Russian female slave at Venice in the year 1450, by one Ser Antonio Colona, who, to quote the document itself,—

"Libere et ex certa scientia dedit et vendidit, sub vinculo servitutis perpetue, viro egrégio Ser Angelo Gadi, de Florentiâ, ementi vice et nomine Ser Laurentii Lutoçi de Nasis, de Florentiâ, et suorum heredum, unam suam esclavam de genere Russiorum, etatis annorum viginti duorum vel circa, vocatam Marta, sanam et integram mente et corpore et omnibus suis membris tam oculis quam manifestis et maxime a morbo caduco, secundum usum terre, exceptuato si grvida esset; et hoc pro precio ducatorum triginta sex auri," the vendor further giving and yielding "purum et merum dominium super dicta esclava, cum plenissima auctoritate et potestate eam habendi, tenendi, dandi, donandi, vendendi, alienandi, pro anima et corpore iudicandi, et de ea disponendi, prout de ipsius emptoris hereditumque suorum voluntate processerit, sine ulla contradictione."

THE following letter is a curiosity which could have been written only in the days of Charles II. At no other period of English history would the manners of the day have allowed an ex-Minister to send, or a king to receive, a bottle of gargle for a royal mistress. But the free-and-easy social habits of Charles's Court forbid us to be surprised at anything. The writer of the letter is Lord Latimer, a gentleman of the bed-chamber, and son of the Earl of Danby, who had remained prisoner in the Tower since his fall in 1679. The seriousness with which the bed-chamber-man describes his own proceedings adds considerably to the drollery of the scene.

"Feb. 8th 1682.

"My Lord,

"I read your letter to y^e King by w^{ch} hee saw your usage att y^e Kings-bench & was very angry. He has sent to speake wth L^d Chieffs Just: to day & when I know what is y^e result of y^e matter I will immediatly send you word. I delivered the watter to y^e King & opened itt & drank 2 spoonfulls my selfe for I told him tho shee was onely to use itt as A Gargle yett if itt went downe there was no hurt in itt, hee has not yett delivered itt to Lady Portsmouth for shee was not up when he was there The Dutch letters are come but I have not heard the news, the[y] came last night as the King was going into bed I will give the King an account of what successe has been today att Westminster w^{ch} Mr Bloome has given mee an account of.

"I am

"My Lord

"Your Lo^{ps}"

"Most obedient & dutyfull son
"LATIMER."

MRS. ALFRED HUNT's new novel, *The Hazard of the Die*, which is announced to appear shortly, will be interesting to students of the English country dialects. The scene has been laid in Yorkshire, at the beginning of this century, and Mrs. Hunt, who is a known authority on the peculiarities of the northern English dialects, has given special attention to this particular, as far as could be comprehensible to the general reader.

RAJENDRALALA MITRA, who last year was deputed by Government to examine and report on the ancient remains of Buddha Gaya, has in

the press a large volume on the antiquities discovered on the spot. The title will be *The Hermitage of Sakya Buddha*.

THE applications for admission to the Hibbert Lectures, to be delivered by Prof. Max Müller in the Chapter House, Westminster, have been so numerous that the trustees have decided to have the lectures delivered twice over, in the morning and the afternoon.

THE Rev. John Macnaught is engaged upon a new work, an *Essay on the Institution, Apostolic Use, and Subsequent History of the Lord's Supper*. It will be published early in May by Messrs. Kegan Paul and Co.

OBITUARY.

LAST week the column of deaths in an evening contemporary announced the decease "at Turnham Green, on April 7, of Mr. Richard Z. Troughton, aged 94." I suppose that this statement can scarcely have interested half-a-dozen people; but it happened to meet the eye of one person connected with letters who had often speculated on the authorship of the single drama on whose title-page this unusual name is to be found. The only work of Mr. Richard Zouch Troughton's with which I am acquainted is the tragedy of *Nina Sforza*, published in 1840. That year was a very remarkable one in the history of our modern poetic drama, for, stimulated by the new day that seemed dawning for the stage, the poets came forward simultaneously with tragedies—Leigh Hunt with *The Legend of Florence*, R. H. Horne with *Gregory VII.*, and Darley with *Thomas à Becket*—the no less remarkable presentations of Talfourd, Browning, and Marston being only a few months earlier or later than these. In this sudden blossoming of dramatic poetry, which preceded the spasmodic school, and was far more worthy of public attention, Mr. Troughton's solitary tragedy appeared. Its author was one of those who crowded around the throne, trembling with the hope of winning an Olympian nod from Mr. Macready. My distinguished friend, Mr. Horne, tells me that he believes that a drama, not *Nina Sforza*, was actually accepted and put into rehearsal; but I have failed to trace it.

The mere fact that a writer who would appear to have been born not later than early in 1784, and therefore before Dr. Johnson died, has passed from us only last week, would be curious enough, even if the writings themselves were nothing; but *Nina Sforza* is so good that I make no apology for recalling its existence to mind. Judged, as it must be, by the standard of its contemporaries, it has nothing to lose by comparison with the admired pieces of Darley and Hunt. It is in blank iambs, and one thing is evident, that Mr. Troughton knew thoroughly well how to fashion a verse. The scene is laid in Venice; Doria, a Genoese nobleman, marries Nina, a Venetian maiden of the house of Sforza, and is afterwards unfaithful to her. Another Genoese noble, Spinola, the Iago of the piece, contrives that Nina shall discover this, and she dies, but is reconciled to her husband before her end. There is a good deal of romantic plot, cleverly conceived, and the play is quite as well adapted to the stage as most modern tragedies, or more so. The workmanship is very even throughout, never very elevated, but never mean. I may be allowed to quote a single passage from a poem so entirely forgotten, to show at what a high level of merit it moves. This scene presents the arrival of the Genoese at Venice:—

"Doria. Of all the fairest cities I have seen,
I give the apple to this Aphrodite!
I long to see her when the chaste'ning moon
Looks sadly down upon her hushed canals,
And these long rows of lighted palaces
Lie trembling in the liquid glass beneath.
Bizzaro. I wonder why they smutch their gondolas
With one eternal and unvaried black;
It grieves the eye.

Dorato.

That struck me, too, my lord.
What if they did them o'er, from beak to stern,
With leaves of beaten gold? So should they seem
A mass of floating metal.

Doria.

Excellent!

Dorato.

I knew my lord would say so.

Doria.

Apt and tasteful!

Bizzaro.

Nay, but suppose they picked his metal out
With painted poetry? The Cydnus, now,
With the brown beauty gliding down in state;

The love-sick Greek who swam the Hellespont,
And made a loadstar of his mistress' lamp;

Or young Andromeda unveiled and bound—
They're better black.

Doria.

Why so?

Bizzaro.

Didst never see,

Doria.

In summer-time, towards eve, a dazzling ray
Dart through a cranny in a pitchy cloud?

Think of a glance from a Venetian eye
Shot through the curtains of these sombre barks!

O they are Sybarites, these citizens!"

EDMUND W. GOSSE.

AFTER a long and painful illness, Mr. H. T. Riley died at his sister's house (the Crescent, Croydon), on the 14th inst. He graduated at Corpus Christi College, Cambridge, in 1840, and was called to the bar in 1847. For Bohn's *Antiquarian Library* he published translations of Hoveden's *Annals* and Ingulph's *Chronicles of Croyland Abbey*. For the *Classical Library* of the same publisher he translated the works of Plautus, Terence, and Ovid, the *Pharsalia* of Lucan, and the *Natural History* of Pliny. His *Dictionary of Latin Quotations, Proverbs, &c.*, has passed through two editions. Under the auspices of the Master of the Rolls he edited a series of works by the monks of St. Albans, containing *Chronicles of English History* by Walsingham, Rishanger, and others, as well as *Memoirs* of the abbots of St. Albans. In 1859 he edited the *Liber Albus* of the City of London; and in 1860 he did a like service for the *Liber Custumarum*. A translation of the former work was published by him in 1862. He also translated and published the *Chronicles of the Mayors and Sheriffs of London from 1188 to 1274*; and in 1868 he printed from the early archives of the Corporation of the City a series of extracts descriptive of London and London life in the thirteenth, fourteenth, and fifteenth centuries. His knowledge of the City archives was extensive and profound, and would have amply justified any mark of appreciation from the City authorities. As one of the inspectors under the Hist. MSS. Commission, he examined and reported on the muniments of most of the Colleges at Oxford and Cambridge, and many of the Corporations throughout the kingdom.

THE *Nation* records the untimely death, at Rio, of Prof. C. F. Hartt, of Cornell University, in charge of the Brazilian Geological Survey. He was a native of Fredericton, N.B., where he was born in 1840; but his geological tastes were first exhibited in Nova Scotia. He became in 1862-65 a student under Agassiz, and accompanied him in his expedition to Brazil as first assistant-geologist. This determined his future connexion with the Empire. His subsequent observations in the Amazon valley led him to differ from Agassiz as to the evidence of glacial action in that region. Prof. Hartt was also an ardent student of the Indian languages, and made a folk-lore collection of no little value. His work on the *Geology and Physical Geography of Brazil* appeared in 1870.

NOTES OF TRAVEL.

PROF. KARL WIENER, who has recently returned from his voyage of exploration in South America, undertaken at the expense of the French Government, has been fortunate enough to carry out successfully the ascent of the Illimani. He succeeded in reaching the south-eastern peak of the mountain, 20,118 feet above sea-level, accompanied by two Germans—Herr Grumkow, civil engineer, and Herr von Ohfeld, settled at Ouzco. Prof. Wiener named the peak "Pic de Paris," an appellation accepted by the Government of Bolivia. The bold explorer buried at the highest point reached a record of his undertaking, hermetically closed in a glass capsule. The ascent was made from Cotana. Of the seven Indian porters accompanying the party, only three persevered to the end; the four others were entirely unable to advance at a height of 19,686 feet. An idea may be formed of the difficulties to be overcome by referring to the celebrated ascent of the much lower Chimborazo by Alexander von Humboldt, and by stating that Gibbon, who attempted the Illimani, had to desist from his undertaking after reaching a height of only 14,765 feet.

IN the course of their last year's work in New Mexico, a United States Topographical Survey party visited numerous Pueblo and Spanish ruins, the largest of which, Gran Quivira, is situated in the plains between the Manzana and Gallinas mountains. It is believed that some followers of Cortez, who were left behind by their leader in his march across the continent in 1550, took advantage of the superstitions of the Montezuma Indians, and compelled them to build this city for them. The Indians afterwards rebelled, murdered their masters, and wrecked the city. The walls of the principal church were found by the Survey party to be still standing; on the outside from the top they are slightly bevelled, the corners being well tied; the masonry used in their construction is partly sandstone, which is well dressed on the outside and beautifully plumbed. To the east of this church is the town, the main building of which appears to have had 800 or 900 rooms. There is now no water near it, but drains and dried-up springs indicate a plentiful supply in former times. The Indians told the Survey party that a river flowed underneath the church, but no trace of it could be discovered.

MR. RALPH RICHARDSON, Secretary of the Edinburgh Geological Society, has published an Agricultural Map of the County of Edinburgh, which is coloured so as to indicate the rental value per acre of the various districts.

MR. STANFORD has just issued the Map of Newfoundland and Labrador, by the Rev. J. J. Curling, late R.E., to which reference was made in the ACADEMY on November 10, 1877. The details of the interior of the country are derived mainly from Mr. Alexander Murray's Geological Survey, and Mr. Curling also acknowledges his obligations to Sir Bryan Robinson for the general information concerning the colony which is inserted on the map. As the map has been compiled chiefly for diocesan purposes, a Handbook is annexed, giving copious details as to mission stations.

THE Rev. Thomas Wakefield, who is in charge of the United Free Methodist Churches' Mission at Ribé, in Eastern Africa, and to whose explorations we have before alluded, is now making a tour among the Galla tribes, chiefly along the River Dana.

By latest accounts from the West Coast of Africa we learn that information had been received from native sources that Lieut. Savorgnan de Brazza and Dr. Ballay were descending the Ogowé, having presumably met with fresh obstacles to their progress, and that they were expected to reach the coast towards the end of March.

THE German Geographical Society, of which Baron F. von Richthofen is President, will celebrate its fiftieth anniversary at the close of this month. There will be a festival meeting on April 30, which will be followed by a grand banquet on May 1. The principal geographical societies of Europe have been invited to send representatives to attend the celebration of the Jubilee.

Good progress is being made with the preparations for the forthcoming Dutch Arctic Expedition. The schooner, the *William Barendsz*, in which it will sail for the Polar regions, has just been launched, having been specially fitted for the voyage, and is to be commanded by Lieut. de Bruyne, who will also have with him two other officers of the Dutch navy. We hear that the staff will include a naturalist among its members, and that Mr. Grant, an English amateur photographer, who accompanied Sir Allen Young in the *Pandora*, has offered to join the expedition, and that his offer has been accepted.

OWING mainly to the recent gold discoveries, New Guinea is attracting much attention in Australia and New Zealand. An expedition was to leave Sydney for that island at the end of February, and others will probably follow. We also hear from New Zealand that it is in contemplation to fit out an expedition to explore the coast-line of New Guinea. This will consist of fifty picked men, thoroughly equipped, and under the command of an experienced leader. With a view to the systematic organisation of this expedition, an executive committee has been formed, with the sanction apparently of the Colonial Government; and, in addition to the investigation of the extensive coast-line of the island, we learn that their programme includes the exploration of the interior and the collection of trustworthy information respecting its climate and its mineral and other products, about which very little is at present known.

WE hear that Captain W. J. Gill, R.E., is preparing for publication an account of his recent journey through Western China and along the Tibetan frontier into Burma.

As the result of a journey of exploration made by Messrs. Horner and Bauer, of the French Mission at Zanzibar, in August last year, a French Mission Station has been established at Mhonda, on the eastern slope of the mountains of Ngura, near the Walé, a northern tributary of the Wami River, about midway between Saadani on the coast, and the village of Mpwapwa on the route to Unyamwezi.

MAGAZINES AND REVIEWS.

PROF. JEVONS's criticisms of J. S. Mill's philosophy, which are appearing in the *Contemporary Review*, have at least the merit of clearness and directness. In truth one may say that they are almost too plain to be of a very high intellectual quality. The third article, which deals with Mill's experimental methods, seeks to show that the logician bases these on causation, while at the same time he bases the latter on the methods. Unfortunately for the critic's claims to originality, the difficulty which here perplexes him is not only one which is the first to be detected by every youthful reader of the *Logic*, but is precisely the difficulty in his system which Mill himself most clearly anticipated and took most pains to obviate. So far from basing the methods on the law of causation, Mill distinctly tells us that this law does not enter into the proof, properly so called, of the conclusions reached by the methods. In a passage of the *Logic* which is conveniently overlooked by Mr. Jevons (Book III., ch. xxi., § 4), Mill says:—

"The assertion that our inductive processes assume the law of causation, while the law of causation is itself a case of induction, is a paradox, only on the old theory of reasoning which supposes the

universal truth, or major premise, in a ratiocination to be the real proof of the particular truths which are ostensibly inferred from it."

As long as a critic takes his stand on "the old theory of reasoning," and so fails to seize the central idea of Mill's *Logic*, it is of course easy for him to give to the author's particular doctrines the semblance of inconsistent if not meaningless propositions.

THE article of most general interest in the present number of *Mind* is headed "Philosophy in Education," and is contributed by two teachers of philosophy, Mr. J. A. Stewart, of Christchurch, and the editor, the Professor of Philosophy at University College, London. Mr. Stewart, who writes in a forcible yet graceful style, makes a good case against the present fashion of teaching philosophy. He sets out with the Greek idea that philosophy is a mental attitude rather than "a definite body of doctrine." To teach the history of philosophy is to present "to the pupil a phantasmagoria of views which he cannot help regarding as severally untrue and unreal." Psychology again, even in its new form of "physiological psychology," is lacking in the essentials of a definite science, and being taught, as it too often is, as the only illustration of scientific method, is positively frustrative of genuine scientific training. The writer proposes that the student of philosophy should take up formal logic at school, and then pass at college to the study of a classic such as Locke, so as to acquire in intimate contact with some master of reflection the philosophic *ἦθος*. The editor's rejoinder is based on the idea that philosophy is something more than a mood, that it essays at least to formulate the truth of things, and that we may approach its least soluble problems by a path which sets out from the firm ground of positive science. Prof. Robertson ingeniously connects Mr. Stewart's view of the question with the conditions of Oxford study. He himself would set out with psychology (the scientific claims of which he ably defends); but then he assumes (what Mr. Stewart appears to look upon as impracticable) that the student should already have had some strict discipline in the study of the physical sciences. The difference between the London and the Oxford feeling makes itself heard again in the remark "that it is no matter of indifference who the thinker (Mr. Stewart's classic) is that should thus be assimilated into the student's mind," and that "as we have to think nowadays in reference to a quite different experience from that of two or three, not to say twenty or more centuries ago, it behoves the student to begin his special study of philosophers with a master not too far removed"—e.g. Kant. Mr. Robertson does not say much in defence of the plan of beginning the study of philosophy proper (as distinguished from psychology, logic, ethics, &c.) with a general survey of its history. Mr. Stewart's remarks on the mischiefs ensuing from the abstract study of systems, apart from their concrete circumstances, are very forcible; yet he appears to exaggerate these evils. It is no doubt true that now and again a young Berkeleyan apprehends "his author's theory of matter in such an abstract manner as to be able to prove from it the truth of the doctrine of substantiation;" yet it is no less true that the brief knowledge of Berkeley's idealism derivable from a manual of philosophic history, or, still better, from a course of lectures on the history, is fitted to awaken a mind naturally disposed to reflection to a wholly new line of thought, and so to make for ever impossible again that unenquiring common-sense view of things in which most men are content to live. Besides, as the editor remarks, how is the student to find out the master mind best fitted to communicate or develop the desired *ἦθος* except by first going through a general survey of the field? Among other interesting papers in *Mind* must be named Mr. Grant Allen's record of a careful series of observations made on a man wanting in musical ear, that is, incapable of distinguishing pitch except

within wide limits, and of recognising the familiar harmonic intervals. The case is probably a very common one, and Mr. Allen has done good service in rendering our knowledge of this organic abnormality (if, indeed, it be such) more precise. He reasons ingeniously respecting the physiological peculiarities underlying such musical deficiency. Mr. Sully concludes his account of the present condition of the question of visual space in Germany by expounding and criticising the theories of the opposed schools, the Nativists and Empirists or Derivativists. Hering, Stumpf, Lotze, Helmholtz, and Wundt are the names which receive most attention. The essayist seeks to define the relation of the scientific question at issue between Nativism and Empirism to the strictly philosophical problems raised by Kant. Mr. Sully's essay is in a sense supplemented by a new contribution from Prof. Helmholtz on the origin and meaning of geometrical axioms. In this paper he argues (against Prof. Land) that the "metamathematical" space relations discussed in his former paper are, or may become, mentally representable, and that consequently Kant's proof of the *a priori* origin of the axioms of Euclidean geometry breaks down. He further seeks to show that even if there is a transcendent intuition of space, our knowledge of the actual laws of space, or "physical geometry," is obtained by way of experience. Finally, the professor restates his theory of reality as of that unknown something which underlies the perceptions that are but its symbols, and seeks to prove the compatibility of this view, which is based on the law of causation, with each of the alternative conceptions of realism and subjective idealism. By so doing he makes an important addition to his theory of perception, which in its earlier forms looks very much like Mr. H. Spencer's doctrine of realism. Mr. F. Pollock gives us another of his interesting studies on Spinoza, in which he traces the influence of mediæval Jewish thinkers on that philosopher's speculations, and redefines its position in relation to the dualism of Descartes and modern scientific monism.

MR. PAYNE'S COLLECTION OF BOOKS.

As we anticipated, the sale of these books at Sotheby's, on Wednesday week, was an event of great interest to book lovers. It is a long time since a like collection was seen in a sale-room in England; for, to tell the truth, English book collectors are not often so fastidious as Mr. Payne about the condition and the antecedents of the volumes which they admit into their libraries. Generally speaking, if an English collector gets hold of a book that is at once rare and perfect, it is enough. In France and Belgium the case is somewhat different, and books are greatly sought after from the fact of their having once belonged to such and such a library, to have belonged to which is in itself a guarantee of every kind of excellence. Accordingly it was not surprising that when it was announced that books were to be sold that had belonged to Francis I. and Henry III. of France, to Grolier, Demetrio Canevaris, and all the great collectors down to Renouard and Charles Nodier, the French as well as the English dealers should come into the competition. Mr. Ellis and Mr. Quaritch found themselves confronted by M. Techener and M. Morgand, and the prices realised by the volumes were driven up to an extraordinary pitch. The first book of beauty was Caxton's *Romance of Arthur* (ed. of 1634), bound in the most charming manner by Roger Payne; Mr. Ellis had this for 18*l.* 10*s.* An Italian life of the Emperor M. Aurelius, from the Canevaris library, and therefore very rare, 17*l.* 10*s.*, Ellis. Mr. Ellis, who seemed to start with a determination to secure everything, bought also the copy of Gough's account of the famous Bedford Missal with three facsimile illuminations (39*l.*); a Bible, supposed to be Roger Payne's *chef d'œuvre* (26*l.*); Messrs. Payne and Foss's account of the Grenville

Library, 4 vols., large paper (17l. 10s.); the extraordinary and probably unique *uncut* Elzevir *Decameron* of 1685 (47l.); and the rare English translation of Boccaccio's *Tales*, 1657 (12l. 15s.). Next came a book which, to the uninitiated, seemed nothing extraordinary—a small 8vo volume, Bossuet's *Exposition de la Doctrine*, 1686, "a charming specimen from the collection of H. B. Longepierre, old blue morocco, with the order of the Fleece stamped in gold on the four corners and on the back." When a lively contest between Mr. Ellis and Mr. Morgand had brought this up to 122l. there was a pause; and then Mr. Quaritch, interposing for the first time, asked to see the book, which presently fell to him at the astonishing price of 127l. The next lot was an Elzevir *Caesar* of great beauty, with brilliant impression of the portrait, and in most faultless condition. It had belonged to M. Renouard. Mr. Quaritch bought it for 20l. 10s. An exquisite specimen of that rare binder, Du Seuil, next fell to the same buyer for 31l. 10s. Then came the turn of the French buyers, M. Morgand securing Cicero's *Letters*, Paris, 1532, beautifully bound by Padeloup, for 19l.; and the very rare Elzevir *Commines* for the enormous price of 48l. 10s. Mr. Ellis paid altogether 117l. 15s. for eleven volumes of Dibdin's works, of course in fine condition and with extra illustrations. An instance of what will be paid merely for the binding was lot 35, where a small *Reflexions des Saints Peres sur la Sainte Eucharistie* (1708), bound sumptuously by Padeloup, was bought by M. Morgand for 24l. The first edition of *Euripides*, 2 vols. in one, in the original Venetian morocco binding, went for 23l. 10s.—probably four times its value. A charming little MS. *Horae* went to Mr. Ellis for 25l. M. Morgand paid 28l. 10s. for a matchless copy of the Elzevir *Imitatio*, bound by Anguerran. An *entirely uncut* Elzevir *Living* (1678) was bought by Mr. Toovey for 22l. 10s. A Milton of 1795, 2 vols., bound by Roger Payne, sold for 18l. 18s. to Mr. Quaritch. The next lot was perhaps the most astonishing of the sale. It was a copy of Bret's *Moliere* (1773), 6 vols., uncut, in the original (and, it must be said, very ugly) half binding. So great is the Parisian demand for eighteenth-century illustrations of the great poets that M. Morgand actually paid 56l. for this book. A splendid MS. *Office* of the Virgin, Italian, late fifteenth-century, sold to Mr. Quaritch for the comparatively low price of 225l., while the extraordinary sum of 180l. was paid for the Plantin *Office*, with borders by Wierix, wonderfully bound, and adorned with the monogram of its first owner, the celebrated President De Thou. Another piece of bookbinding, the *Proclus* which had once belonged to Francis I., sold to Mr. Harvey for 48l. 10s. Mr. Quaritch bought for 63l. a very curious MS. Psalter, said to be of the thirteenth century. The one example of a Grolier binding, the Aldine *Sannazarius*, an undeniably beautiful book, was bought by M. Techener for 89l.; and Mr. Harvey, of Piccadilly, secured for 100l. another book which the French were very anxious to have—Henry III.'s copy of Stella's *Meditations*. The same buyer paid 51l. 10s. for a New Testament of 1712, bound in a very masterly manner by Du Seuil. Mr. Quaritch secured the very early Gutenberg *Thomas Aquinas*, probably 1458 (86l.). Perhaps the most notable instance of the craze for bindings occurred with the Elzevir *Virgils*. The first and largest copy, in the original vellum, sold for 11 gs.—certainly a great price. But the next copy of the same edition, slightly smaller, happened to have been bound by Derome; and Mr. Quaritch paid 50l. for it. The copy of the larger Elzevir of 1676, which had been presented to Louis XIV. when "Serenissimus Delphinus," most sumptuously bound, and with the autograph dedication of Heinisius, sold to a Dutch buyer for 24l. The sale ended with some miniatures, three of them of great beauty. Mr. Quaritch bought the *Girolamo dei Libri* (206l.), and the pair from a

missal executed about 1440 for the Bastard of Orleans, probably by the painter of the *Bedford Missal* (215l.). The last and most beautiful, *John Fichet, Doctor of the Sorbonne, presenting his book to Pope Sixtus IV.*, fell to M. Morgand's bid of 265l.

SELECTED BOOKS.

General Literature.

- CAMOWENS, *The Lusiads*. Portuguese text, with translation into English Verse by J. J. Aubertin. C. Kegan Paul & Co. 80s.
- CARTAILHAC, E. *L'Age de pierre dans les souvenirs et superstitions populaires*. Paris: Reinwald.
- DOERFFEL, E. *Johann Friedrich Christ, sein Leben u. seine Schriften. Ein Beitrag zur Gelehrtengegeschichte d. 18. Jahrh.* Leipzig: Breitkopf & Härtel. 8 M.
- DOWDER, R. *Studies in Literature, 1789-1877*. C. Kegan Paul & Co. 12s.
- FYTCH, A. *Burma, past and present*. C. Kegan Paul & Co. 80s.
- HOWELL, G. *The Conflicts of Capital and Labour*. Chatto & Windus. 7s. 6d.
- DEWILLE, Comte H. d'. *Gustave Courbet*. Paris: Lib. Parisienne. 25 fr.
- SAUVÉ, L. F. *Proverbes et dictons de la Basse-Bretagne*. Paris: Ohampton.
- SPRINGER, A. *Raffael u. Michelangelo*. 2. Buch. 1. Hälfte. Leipzig: Seemann. 8 M.
- THEORNTON, W. T. *Word for Word from Horace*. Macmillan. 7s. 6d.
- UZANNE, O. *Caprices d'un bibliophile*. Paris: Rouveyre. 5 fr.

History.

CORRESPONDENCE.

ROBERT FLOWER, THE LOGARITHMIST, 1771.

25 Argyll Road, Kensington: April 13, 1878.

In the *ACADEMY* for October 20, 1877, p. 386, col. 3, I gave an account of Robert Flower's book, and enquired whether anyone knew anything about him. This letter brought me some good suggestions for enquiry from Mr. Hyde Clarke, which I have not been able to follow out, and some very important references from Mr. Peter Gray, F.R.A.S. (author of *Tables for the Formation of Logarithms and Anti-logarithms to Twenty-four or any less number of Places*, 1876), and Mr. Thomas Warner, F.R.A.S. (whom Mr. Gray mentions in his preface as having contributed to the expenses of printing those tables). By following out these references, by transcribing Flower, and comparing his process with Briggs's (in his first edition of the *Arithmetica Logarithmica*, 1624, and Vlacq's first edition, 1628; it disappears in subsequent editions), I am now able to give the following account of Robert Flower and the history of his book.

Dr. Charles Hutton, in the first edition of his *Mathematical Tables*, 1785 (the following important anecdote disappears in subsequent editions),

p. 72, footnote to a description of the method of interpolation given by Briggs, chapter xi., says:—"It is no more than a large exemplification of this method of Briggs's that has been printed so late as 1771, in a quarto tract by Mr. Robert Flower, under the title of *The Radix, a New Way of making Logarithms*, though Briggs's work might not be known to this writer.—Since this was written I have been favoured with the following anecdote concerning Mr. Flower and his work, by the Rev. Dr. Horsley, the learned editor of the works of Sir I. Newton. 'This Robert Flower was very obscure, and probably illiterate. He was master of a writing school in the town of Bishop Stortford in Hertfordshire. He communicated his *Radix*, before he published it, to my late learned friend Math. Raper, Esq., of Thorley Hall [one mile from Bishop Stortford]. I was at Thorley at the time, upon a visit to my father [Bishop of St. David's 1788, of Rochester 1793, of St. Asaph 1802, d. 1806], who was rector of the parish, and I well remember that Mr. Raper told me with great surprize, that Flower, (who was known to us both by name as the writing master of the neighbouring market town,) had fallen upon Briggs's way of finding all logarithms from the first ten chiliads [this was an incorrect appreciation, see below]. And he was so well persuaded that Flower had made the discovery for himself, without any light from Briggs, that with his accustomed munificence he rewarded the man's ingenuity with a present of ten guineas; informing him, I believe, that his work had been done before, and dissuading the publication.'"

Probably the "ten guineas" acted more powerfully than the "dissuading," and fortunately, as the "work" had not been "done before," the book was published in 1771, the last table in it being dated 1770. Immediately on reading the above anecdote, which I did not see till this month, I wrote to the Rev. G. S. Bayne, vicar of Bishop's Stortford, who, in reply to my queries, most kindly gave me the following information concerning Robert Flower: "his burial is recorded under date February 23, 1774 (bachelor) set. 63. One of the 'oldest residents' states that 'relatives of his' own house property at Limehouse."

Hence Robert Flower, whose book was "printed for the author," died without leaving either a widow or family, three years after its publication. This circumstance, in conjunction with his own obscurity, sufficiently accounts for the practical disappearance of his book. I am glad to say, however, that through the kindness of Mr. Graves's brother, the duplicate in the Graves Library of University College, London, was presented to the British Museum last December, so that two copies are now accessible in well-known public libraries.

Hutton, Horsley, and Raper, were misled by the nature of Flower's *table*, to consider his *method* the same as Briggs's, who uses a similar table, but of much less extent. Flower had no object in interpolating in Briggs's Chiliads. He had probably never seen them, for the book was even then excessively rare, and probably Flower's knowledge of Latin was very limited. Flower refers to Ulacq's (sic) *Canon of Ten Figure Logarithms*, and Dodson's *Anti-logarithmic Canon of Eleven Figures*, but the logarithmic tables which he used were clearly Sherwin's, to which he frequently refers without specifying the edition (from 1706 to 1771-1742 best, 1771 worst: see *Report of British Association* for 1878, p. 129). Flower's object was to calculate the logarithm from the number and conversely, independently, and without any table but his own *Radix*. And this he effected in a very complete manner, of which Houël (*Tables de Logarithmes à 5 Décimales*, ed. 1877, p. xxix., note) says that "[elle] nous a paru la plus simple de toutes celles qui ont été proposées pour le même objet." Flower's method of finding the logarithm from the number is totally dissimilar from Briggs's; but his method of finding the number from the logarithm is almost necessarily the same, and has been subsequently proposed by several others. His method of finding the logarithm was rediscovered, independently apparently, in 1348 by the late Mr

William Orchard (see preface to P. Gray's *Tables for the Formation of Logarithms and Anti-logarithms to Twelve Places, with Explanatory Introduction*, 1865, p. 52). Without studying Flower's own book it is impossible thoroughly to understand the complete mastery which he had gained over his method, and the entire originality of his processes. Briggs's table, which is headed "Tabula inventioni Logarithmorum inserviens," on page 32 of the *Arithmetica Logarithmica*, consists of ten of Flower's classes, containing 90 logarithms, each of 15 places, with numerous errors in the 15th, and not a few in the 14th, and with two internal errors—namely, in the 2nd periods of log. 4 and log. 1·0005, where 99903 and 70029 should be 99913 and 70929; the former is corrected, the latter retained, in his *Chiliads*. But Vlacq, who simply gave the table to 10 places, repeats both the errors, though he corrects both in his *Chiliads*. Flower calculated his *Radix* to 13 classes, which, including log. 10, gave 118 logarithms, each to 23 places, of which he considered 22 to be "true." I have only found one case in which 22 were not true, and that is log. 1·00009, where the 3 last places are 695, in place of 717—that is, if 22 places only were taken, 70 for 72. To 21 places, all he really relies on in his title-page, containing 11 classes (which he calls 10, not reckoning the first) and 100 logarithms, every figure is perfectly correct. Hence he had evidently done much more than merely give "a large exemplification of" Briggs's method. His mode of calculating these logarithms (described in my former letter) was extremely laborious, and can now be greatly simplified; but this does not in the least detract from his merits. As the earliest inventor of a practical method of finding logarithms to a large number of places by an eminently simple method, Flower deserves a conspicuous place in the history of logarithms, of which the practical disappearance of his book in England has unfortunately hitherto deprived him. I trust that his name will not be in future forgotten by any English writer on logarithms.

It is not a little singular that, while both his name and method were forgotten in England, the method and sometimes the name should be known in widely-diffused manuals on the Continent; and this is how it came about.

In the year XI. of the old French Republic (1802-3) Zecchini Leonelli, born at Cremona in 1776, two years after Flower's death, and hence at twenty-six years of age, printed (he himself says "publié," but M. Hoüel says, "Leonelli n'avait pas mis son ouvrage dans le commerce,") his now celebrated *Supplément Logarithmique*, one single copy of which is known to exist, in the library of the city of Bordeaux, bearing the inscription: "Ex dono Autoris." Leonelli became subsequently physical assistant of Prof. Mossotti at Corfu, where he died in 1847. His book, which is in every respect remarkable, was reprinted in 1875 with a biographical notice, by M. Hoüel, professor of pure mathematics at Bordeaux, for 4 fr., and I recommend every one who is interested in the subject to order a copy of the publisher, Gauthier-Villars, in Paris. In the original memoir, which Leonelli submitted to the French Academy, he rediscovered Briggs's method. In one of the paragraphs added to his own impression of that memoir, he says of this method:—"Aucun compilateur de logarithmes, après Vlacq, n'en a parlé, et elle se trouvait inconnue par les mathématiciens les plus accrédités [for proof of which he cites the report on his work, signed 1 Floréal an 10, = 21 April 1801, by Lalande and Delambre, which is given at length at its conclusion, pp. 60-64, and which apparently first brought Briggs's method and Flower's book under his notice. We can well understand, therefore, Flower's ignorance of it]. Le simple hasard a fait que je donne dans les mêmes idées de Briggs, ne connaissant pas plus que les autres ce qu'il avait écrit sur ce sujet. Robert Flower, en 1771, a publié à Londres une méthode semblable, qu'il a trouvée probablement par le même hasard, et qui est encore assez peu propagée pour être ignorée.

Je ne l'ai connue qu'au moment où je cherchais des moyens pour abréger la division, travail unique et assez bien compensé de cette décomposition [de Briggs]. C'est le cit. Evêque, membre de l'Institut, qui a bien voulu me confier l'opuscule de Flower, qu'il a acquis en Angleterre. La décomposition, dont Flower se sert, est en quelque sorte différente [de celle de Briggs], et oppose, en certains cas, quelque petit obstacle à la généralité de la règle; mais elle est plus courte que celle que nous avons exposée" (p. 16). In Delambre's report (p. 61) the title of Flower's book is cited from M. Masères's reprint of Hutton's preface, together with the false appreciation there given.

Leonelli gives both Briggs's method, explained by himself (for Briggs exemplifies, but can scarcely be said to explain), and re-arranges Flower's table, of which he gives only twenty places, adding a table for natural logarithms, also to twenty places. Moreover, he gives a table to fifteen places proceeding by two figures, instead of one, that is, instead of 1·09, 1·08, &c., he has 1·099, 1·098, 1·097, &c., up to the insertion of seven zeroes between 1 and the significant figures. The same work also contains a "Théorie des logarithmes additionnels et deductifs," which gave rise to Gauss's celebrated logarithms of addition and subtraction.

Although Leonelli's work became practically unknown, a German translation (very badly printed, and containing numerous changes) was made by Leonhardi in 1806 (the Royal Society has a copy, and it is described in *Report of Brit. Assoc.*, 1873, p. 76), from which Gauss obtained the hint for his own logarithms (see Gauss's *Werke*, vol. iii., p. 244, cited by Hoüel), and from which probably Schrön, in his *Interpolations-Tafel*, 1861 (translated by Hoüel, 1873), gave Flower's table to 16 places, both for natural and tabular logarithms with an explanation; but, singularly enough, without mentioning the name of either Flower or Leonelli, an omission which, more strangely still, is not supplied in Hoüel's translation. But in Hoüel's *Recueil des Formules et de Tables Numériques* (second edition, 1868), Table V., he gives Leonelli's table, proceeding by two figures, abridged to 15 places, and in the introduction (p. xiii.) mentions Leonelli, but not Flower. However, in his popular tables to 5 places he mentions Flower's name and date (edition 1877, p. xxix., note); but not the title of his book, and gives Flower's *Radix* as Table V. to 20 places only, following Leonelli. Don V. Vazquez Queipo, of whom I spoke in my former letter as the author from whom my knowledge of Flower was first obtained, re-arranged his table and description, as he has informed me himself, from Hoüel, but added the 21st place from Fédor Thoman (*Tables de Logarithmes à 27 Décimales pour les Calculs de Précision*, Paris, 1867), who, in Table IV., gives Flower's *Radix*, from 1·00 through 13 classes, to 27 places of decimals, but does not mention the name of Flower or of any previous writer. None of these writers but Leonelli had seen the original book.

In England, as already mentioned, Mr. Orchard rediscovered Flower's method, without knowing of Leonelli, and Messrs. Weddle and Hearn discovered another method, essentially of the same character, but avoiding one of the difficulties in Flower's plan. They left a difficulty in starting, which Thoman endeavours to surmount by using approximate reciprocals, but I believe that my "preparation" (part of my own method not yet published) is simpler. Mr. Gray's tables form very convenient accessible means for finding logarithms, but are much more extensive, and his method is of a totally different character, employing, like Briggs's, a continually augmenting divisor, obtained by a process which is also substantially the same though different in appearance. But Briggs obtains his resolution in single digits, in order to suit his own table of one page, equivalent to Flower's *Radix*, whereas Mr. Gray resolves into sets of three digits for which his own tables of 41 pages are constructed. The essentially different

methods of finding logarithms are then, Briggs's by division with an augmenting divisor, Flower's by resolving by addition, and Weddle's by resolving by subtraction. Gray's belongs to the first, Orchard's is the second, Thoman's is a variety of Weddle's. To these we may add Namur's (*Tables de Logarithmes à 12 Décimales*, Bruxelles, 1877) depending upon the properties of the modulus, in which the calculations are short, but the method rather troublesome to use. My own method depends upon another property altogether, used in an entirely different way by Koralek (*Nouvelle Méthode pour calculer rapidement les Logarithmes des Nombres*, Paris, 1851), but sometimes employing the same radix as Flower, and sometimes in part the negative radix (as it may be called) of Weddle. Observers like Hutton, Horsley, and Raper, who confused Flower's method with Briggs's on account of the similarity of the table, and snubbed him accordingly, might confuse mine with both, or with Koralek's. The confusion in Robert Flower's case has been extremely important, but I hope that no doubt will hereafter rest on the originality, independence, and value of the method invented by the poor bachelor writing-master of Bishop's Stortford, who published his *Radix* in the sixtieth year of his laborious and obscure life. Honour be to his memory!

ALEXANDER J. ELLIS.

A NEW PLEONASM.

London: April 18, 1878.

Let me call attention to a piece of faulty grammar which is becoming as unpleasantly frequent as "frightened of," if not as "different to." It is a pleonastic use of the before proper names, which has only lately crept into literary language, though long a colloquialism of the uneducated, commonest in street nomenclature, but abundant enough in other phrases also. Thus we find "the Oxford University," "the London diocese," "the St. Thomas's Hospital," and so forth. Sometimes, no doubt, there is warrant for it, as in the case of "London Road, Manchester," which is in fact the road leading to London, and may thus rightly be called "the London Road;" but the very same phrase is currently used of London Road, Southwark, which is itself a part of aggregate London, wholly within its limits, and going far too short a distance towards what was once open country to have ever been known as the road to London from any outer point, for it is in fact only the western end of the New Kent Road.

In your own advertising columns of March 30 I find "the London Hospital," a phrase implying that there is no other hospital in London, and by no means marking that "London" is here only a distinguishing epithet—as in "London Bridge," "London Stone"—not a local description. It is precisely because we can quite correctly use such expressions as "the Baltic fleet," "the China trade," and the like, that this inexact use of *the* where it is superfluous, and may be misleading, ought to be checked, and avoided, at any rate, by writers having pretensions to culture.

R. F. LITLEDAL.

OLD DEVONSHIRE NAMES.

The Limes, Crediton, Devon: April 15, 1878.

In a list of persons belonging to a guild of St. Nicholas at Barnstaple, probably about the year 1330, occur the following remarkable names:—Thomas Lelya, mayor; Giordan Drua; Gencian Birna; Swytta; Busla; Walter Cardua; and Philip le Metteppa. No local names are to be found at present, either in Barnstaple or elsewhere in Devonshire, which can fairly be supposed to represent these of the guild list. The termination in *a* occurs in some Cornish names; but those given above do not in any way suggest a Celtic origin. Can they indicate some peculiarity of local dialect or pronunciation?

I should add that the original of the guild list

does not exist. I have taken the names from a copy made by a Mr. Inledon, who was elected Recorder of Barnstaple in 1758, and who was widely known as an able antiquary and scholar. Copies of other documents made by him, and compared with the existing originals, show that he may be thoroughly trusted as a transcriber. He was evidently struck by these unusual names; and opposite that of "Swytta" he has written "Sweet?" with a note of interrogation.

RICHARD JOHN KING.

SCIENCE.

The Physical Basis of Mind; being the Second Series of Problems of Life and Mind. By George Henry Lewes. (London: Trübner & Co., 1877.)

(Second Notice.)*

In the third essay, which is upon "Animal Automatism," Mr. Lewes discusses two questions:—"First, whether animals are machines; and if not, by what character do we distinguish them from machines?" In his treatment of this he does little more than reiterate what he has said already in the first essay. The second question, "In what sense is Feeling an Agent?" leads him first of all to an extended exposition of his Two-aspects doctrine. Consciousness, which all accept as the final arbiter, testifies to a radical distinction between Soul and Body; but it does not say: I am two things. A contrast of aspects may therefore be sufficient to account for this distinction. Mr. Lewes, like Fechner, falls back by way of illustration on the contrast between the aspect of a circle as seen from within, where it appears concave on all sides, and its aspect as seen from without, where it appears everywhere convex. But whereas the underlying identity in the curve is sensible, in the case of Body and Mind it has to be proved. The main difficulty for most thinkers hitherto has been that of "imagining how a physical process could also be a psychical process, a movement also be a feeling." Mr. Lewes believes that he can remove this difficulty, and invites an open-minded consideration of his attempt. To begin, he tells us that Consciousness on a closer scrutiny will be found "to testify to nothing more than a *diversity of manifestation*. All, therefore, that comes within the range of knowledge is, How does this diversity arise?" The explanation he finds in the difference in the *modes of apprehension*. Let us be sure that we understand Mr. Lewes. He says:—

"One and the same object will necessarily present very different aspects under different subjective conditions, since it is *these* that determine the aspect. . . . The vibrations of a tuning-fork are seen as movements, heard as sounds. . . . The tuning-fork—or that Real which in relation to Sense is the particular object thus named—will, by one of its modes of acting on my Sensibility through my optical apparatus,

determine the response known as *vibrations*; but it is not this response of the optical organ which is transformed into, or causes the response of the auditory organ, known as *sound*. . . . The responses are both modes of Feeling, determined by organic conditions, and represent the two different relations in which the Real is apprehended. . . . My consciousness plainly assures me that it is I who see the one, and hear the other; not that there are two distinct subjects for the two distinct feelings. Add to which, manifold uncontradicted experiences assure me that the occasional cause—the objective factor—of the one feeling, is also the cause of the other, and not that the two feelings have two different occasional causes. From both of these undeniable facts we must conclude that the difference felt is simply a difference of aspect, determined by some difference in the mode of apprehension" (pp. 340, 341).

Now for the application. We should expect a *subject* apprehending by some one organ the psychical, and by some other the physical, aspect of an *object*, which is in the first relation a logical proposition, in the second a neural process. But instead of the subject—no matter who or what—and the object being two Reals, they are, it seems, but symbols of the way in which feelings get themselves sorted. There remains no object that can have two aspects and no subject to which these can hold a twofold relation; but object and subject themselves take the place of aspects, and instead of being really distinct are in reality "indissolubly combined and only ideally separated." The whole point of the illustrative case, where, as Mr. Lewes says, the two aspects are "evident to sense," is that he has a $\delta\sigma\ \pi\alpha\upsilon\sigma\ \sigma\tau\omega$: "my consciousness plainly assures me that it is I who see the one, and hear the other." It is just for want of this holding-offness that Mr. Lewes's "speculation" is not so "eminently probable" as he supposes. A philosophy that evolves Ego and Non-Ego out of feeling by a process of grouping may go on evolving for ever but will never advance one step beyond groups of feelings when it has done. Either, therefore, Mr. Lewes must part from the Associationists or he must part from Realists such as Herbert or Fechner. If he aspires to explain "psychologically" that unique relation of subject and object we call perception, he must forego the solution of the problem of dualism. But allowing the real distinctness of subject and object, the two-aspects "speculation" has new difficulties to face. For when Mr. Lewes proceeds to substitute for classification of feelings, which is manifestly insufficient, a difference in the mode of apprehending the object, he only secures this by having two subjects; whereas in his illustrative case he especially notes that "there are not two distinct subjects for the two distinct feelings." Thus he says:—

"Although a logical process is identical with a neural process, it must appear differently when the modes of apprehending it are different. While you are thinking a logical proposition, grouping your verbal symbols, I, who mentally *see* the process, am grouping a totally different set of symbols; to you the proposition is a subjective state, i.e., a *state* of feeling, not an *object* of feeling: to become an object, it must be apprehended by objective modes: and this it can become to you as to me, when we see it as a process, or imagine it as a process" (p. 349).

Here we have for two aspects of one thing "a *state* of feeling" for one subject, and

an "*object* of feeling" for the other. And even if with Mr. Lewes we suppose the two subjects to be eventually the same, suppose, for instance, that a man's head were transparent, and that he could see the neural process as he might see the winking of his eye—by looking in the glass; yet this makes no real difference. So far as the neural process goes he is only like anyone else who can see it as well as he or better; but the "*state* of feeling" is *his only*. If then we refuse to identify subject and object in Mr. Lewes's fashion—which we surely must do if we attempt metaphysics at all, as Mr. Lewes is himself forced to do during part of his argument—we seem to have something "presented" with a double aspect, to me a "*state* of feeling," to you an "*object* of feeling," over and above the *Ego* or rather the *Nos*; they have between them this two-sided x , like the pillar that to Israel was a pillar of fire and to Pharaoh's host a pillar of cloud. This much monism modern science is perhaps in a fair way to demonstrate (1) by showing that there is a physical equivalent for every so-called "mental state;" and (2) by establishing a quantitative relation between the intensities of these. But such monism, which is all Mr. Lewes ought really to intend, is a long way from the monism with which he seems to identify it.

And even this he seriously jeopardises in his endeavours to prove that consciousness is an agent in the working of the organism. Thus to the following passage from Prof. Huxley's Address:—

"The consciousness of brutes would appear to be related to the mechanism of their body simply as a collateral product of its working, and to be *as completely without any power of modifying that working as the steam-whistle which accompanies the work of a locomotive engine is without influence upon its machinery*,"

Mr. Lewes replies:—

"The feeling which accompanies or follows a particular movement cannot, indeed, modify *that* movement, since that is already set going, or has passed: here there is some analogy to the steam-whistle; but the analogy fails in the subsequent history. . . . The feeling which *accompanies* one muscular contraction is *itself* the stimulus of the next contraction; if anywhere during the passage the hand comes upon a spot on the surface [it is supposed to be passing over] which is wet, or rough, the change in feeling thus produced, although a collateral product of the movement, instantly changes the direction of the hand, suspends or alters the course—that is to say, *the collateral product of one movement becomes a directing factor in the succeeding movement*" (p. 407).

Now let us represent the psychical aspects of a series of changes in Mr. Lewes's "*Real*" as $\alpha\beta\gamma\delta\epsilon$, and the concomitant neural processes as $a\ b\ c\ d\ e$: then the assumption made—and apparently by Prof. Huxley quite as distinctly as by Mr. Lewes—is that, no matter how involved the psychical series, the chain of physical sequences, could it be accurately observed, would appear absolutely continuous: that there would be no break in our $a\ b\ c$ where a member of the $\alpha\beta\gamma$ aspect might be supposed in some inconceivable way to intervene. But Mr. Lewes's assertion that "the feeling which accompanies one muscular attraction is *itself* the stimulus of the next" seems to stultify

* See ACADEMY, March 16.

his whole position: here surely all the difficulties of Dualism, from which he promised to deliver us, are upon us again. To make it consistent with the rest, we must say: The feeling which accompanies one muscular contraction is followed by another feeling, the concomitant of the central process which is the stimulus of the next contraction. For Mr. Lewes, having defined "stimulation" as "change of molecular equilibrium," can hardly intend that one molecular state does not proceed continuously from a preceding molecular state. Moreover, in his illustrative case he urges that the vibrations do not cause the sounds, but that both are different relations of the same Real, &c.; causal connexion being manifestly out of the question, when *ex hypothesi* there are not two "Reals" to connect. We cannot suppose Mr. Lewes to have forgotten this, or to intend that the same event has two causes. If a given series of movements in an organism are mechanical at all, then the mechanical explanation is as sufficient in their case as in any other. Whether mechanical explanations are always insufficient and need supplementing by psychological ones, as Zöllner and others maintain, is another question. But anyhow, interpreted in terms of Matter and Motion, the brain—which cannot be otherwise interpreted—is, to use the words of Claude Bernard, displayed singularly enough in the forefront of this essay, "un vaste mécanisme qui résulte de l'assemblage de mécanismes secondaires," a mechanism which can only then favour Mr. Lewes's view if it prove to depend like Psycho on continual guidance from without or from within, or rather in some inconceivable way from no side at all. That it has a psychical aspect which the automaton lacks makes no more difference to the physical aspect than the accompanying movements of its shadow during sunshine make to the working of an engine which is without a shadow in the dark. But if, as Mr. Lewes maintains, the psychical aspect does affect the physical aspect; if consciousness is an agent in the movements of the organism; then the distinction to which it testifies must be something deeper than "diversity of manifestation" or "different relations in which the Real is apprehended." But we may allow that "if the feeling had been different the succeeding movement would have been different," without allowing that the feeling was an agent in the movement. If the feeling had been different the movement would have been different indeed; but so would the preceding stimulus, whose psychical concomitant would have been that possible different feeling. The concluding paragraph in which Mr. Lewes identifies the reader with his views is a worthy finish to the whole:—

"The question of Automatism . . . may, I think, be summarily disposed of [why then a hundred pages of argument?] by a reference to the irresistible evidence each man carries in his own consciousness that his actions are frequently—even if not always—determined by feelings. He is quite certain that he is not an automaton" (p. 409).

Of course the reader is quite certain of all this, but that only means that the psychical

aspect cannot be identified with the physical aspect; it does not and cannot prove that a physiologist who should keep strictly within his own sphere would ever find anything but animal automatism in the reader's "neural processes" and "actions."

On a survey of this essay, the most important in the volume, the conclusion seems unavoidable that Mr. Lewes has involved himself in many confusions and inconsistencies for want of more thorough and more patient analysis and more rigorous definition. But we must not quit it without noticing his version of the automatism Descartes propounded. "Descartes," he says in a note, "expressly calls them [i.e. brutes] sensitive machines. He refuses them Thought, but neither 'la vie ou le sentiment.'" But in refusing brutes Thought Descartes refuses them everything of a psychical nature; for Mr. Lewes will surely agree that Descartes' *pensées* cannot be restricted to Consciousness in the usual sense. Again, Descartes expressly attributes sentience as a confused form of *pensée* to the union of body and soul; how then, could he credit brutes with this sentience when denying that they had souls? For Descartes quotes Lev. xvii., 14, with great satisfaction, as evidence that the only soul the brutes have is their blood. In keeping with this, too, is the passage in the "Replies to Objections," where, in answer to the objection that mechanical explanations are insufficient without attributing to animals "ni sens ni âme ni vie," Descartes replies: "C'est-à-dire, selon que j'en explique, sans la pensée; car je ne leur ai jamais dénié ce que vulgairement on appelle vie, âme corporelle et sens organique," and thereupon he proceeds to reassert that there is no proof that animals have *pensée*. The conclusion of his *L'Homme* is equally decisive. Having described what he considers to be the purely bodily functions, including among these the reception and retention of impressions, and even the internal movements of the appetites and passions, he desires the reader to consider that all these are "neither more nor less" mechanical than the movements of a clock, so that the assumption of "a soul either vegetative or sensitive" is needless: the blood and animal spirits with the heat generated in the heart sufficing for everything.

The last essay in this volume is devoted to the "Reflex Theory." It is perhaps the clearest and most connected of the four, and calls for little remark here; except, indeed, that the lax use of the words "brain" and "decapitate" must infallibly mislead the uninstructed reader. Mr. Lewes's contention is that the spinal centres, the seat of the chief reflexes, "have Sensibility of the same order as the cerebral centres," and are not simply mechanisms whose activities have no psychical aspect. The difficulty for many will be not to go as far as Mr. Lewes, especially if they attend to the wealth of proof he brings, but to refuse some sort of psychical aspect to any material movements, or at least to the movements of protoplasm. The principle of Continuity will carry them on. If the Amoeba manifests that incalculable spontaneity or automatism which in higher organisms is the characteristic of nerve-protoplasm, and this has sentience,

must not the Amoeba have it too? And if matter in the organised state have a double aspect, can we imagine this aspect to disappear for the same material when disorganised? Ought not Mr. Lewes's monism to lead him to a panpsychism, and bring him into company with Herbart or Lotze or some other exponent of the Leibnizian Monadology?

JAMES WARD.

SCIENCE NOTES.

BOTANY.

Ueber die Entwicklungsgeschichte des Prothalliums der Marattiaceen.—In the *Botanische Zeitung*, March, Dr. H. F. Jonkman states the results of his observations on this interesting subject. The germination of the *Filicinae* has lately been the subject of various investigations—the *Osmundaceae* by Kny and Luerssen, the *Cyatheaceae* by Bauke, the *Parkeriaceae* by Kny, *Aspidium filix mas* by Pedersen, *Aneimia* by Burck, and the *Hymenophyllaceae* by Prantl—but until now very little has been known of the early stages of the *Marattiaceae*. Mettenius and Harting, and more recently Luerssen, have taken up the subject, but with no success as regards the germination of spores. On November 1, 1874, Dr. Jonkman sowed the spores of several species of the genera *Marattia* and *Angiopteris*, with the result that he was able to follow the history of the development of the prothallium of *Marattia Kauffussii*, J. Sm., as far as the complete formation of the antheridia; of the others some germinated, but the growth did not proceed far and they ultimately perished. On May 15 following he sowed again *Marattia Kauffussii*, J. Sm., *Marattia alata*, Sm., *Marattia (Gymnotheca) Verschaffeltiana*, De Vriese, *Marattia (Gymnotheca) Weinmanniaefolia*, Lieb., *Angiopteris pruinosa*, Kze., and another species of *Angiopteris*, and in all of these cases he succeeded in bringing them as far as the formation of the antheridia. Although in the first sowing only one case succeeded in forming antheridia, and that after the lapse of eight months, in the second, germination began in a few days, and the antheridia of the *Marattiaceae* were formed in five, and those of *Angiopteris pruinosa* in less than four months. Of the second species of *Angiopteris* the prothallia were not so numerous, and antheridia, few in number, appeared only on November 25 following. In this case the prothallia were larger than those of the other species of *Marattia* and *Angiopteris*, and the probability is that they were fitted to produce archegonia (as in the case of *Osmundaceae*, according to Luerssen, and of *Parkeriaceae*, according to Kny), but this was left undecided. The germination of the spores seems to have been carefully watched, and the identity of the prothallia in each case established; which was easy, since these are of a very dark green colour, and usually have the Exosporium attached. The thread-like prothallia of the *Marattiaceae*, observed by Schelting, are considered by Dr. Jonkman to be the result of the want of light and space. Their different character is to be ascribed to a difference in external conditions, and not to a difference in the spores as Luerssen contended. The two plates are of much use in illustrating the detailed account of the morphology.

Beiträge zur Keimungsgeschichte der Schizaeaceen. Von Dr. Hermann Bauke. (Pringsheim's Jahrbücher, Band XI.)—The subject of this Memoir is similar to Dr. Jonkman's, but the labour connected with it has been much greater, partly from the pre-existing literature and also from the fact that the author has gone far more fully into the details of his subject. Burck's work on *Aneimia* is subjected to much criticism, which in view of the facts presented by Dr. Bauke appears to have been quite necessary. Among the species examined by Dr. Bauke were *Aneimia phyllitidis*, Sw.; *A.*

Alina, Raddi; *A. cheilanthoides*, Sw.; *Mohria affrorum*, Desv.; and *Ceratopteris thalictroides*. The subject of the germination of the spores and the development of the prothallia is very thoroughly and minutely described. The results of the investigation are important as regards the whole life-history of the sexual generation, about which there was very little certain knowledge. The plates are very well executed and of much value.

We have received a *History of Bible Plants* by Dr. John Smith, ex-Curator of the Royal Botanic Gardens, Kew. The book is a handy little volume containing in short compass a great amount of information on this interesting subject. It is a matter for congratulation that Mr. Smith is at an advanced age, and in spite of the failure of his eyesight, should have been able to bring out the present volume.

M. VAN DER HAERT, of Utrecht, has lately discovered in the lobes of the seed of *Phaseolus vulgaris*, when in germination, a ferment which can be extracted by means of glycerine. It transforms albuminous matter into peptones and starch into glucose.

M. THURET's garden at Antibes has become the property of the French Government. It is decided that it is to be a Mediterranean branch of the Jardin des Plantes of Paris.

ASTRONOMY.

Supplement to Sir John Herschel's "General Catalogue of Nebulae and Clusters of Stars."—In the *Philosophical Transactions of the Royal Society* for 1864 Sir John Herschel published his "General Catalogue," in which he had collected and arranged in proper order the places and descriptions of all nebulae and clusters which had come to his knowledge. The bulk of the work expended, of course, on the observations made by his father and by himself, as this field of investigation had been particularly their own. Indeed, considering that just then several observers were engaged in further researches in the same field, and that the time for a trustworthy general catalogue had scarcely come, not a few practical astronomers would have preferred that either the additional nebulae not observed by the Herschels, or at least those the approximate places of which had not been determined and were only vaguely indicated, had been given in a separate list. The perfect sifting of the heterogeneous materials which are mixed together in the General Catalogue renders it necessary to be very cautious and circumspect in using it, and even the new numbering of the nebulae is under the circumstances not without disadvantages. During the years which have elapsed since the publication of Herschel's catalogue some important contributions have been made towards a better catalogue of nebulae. More than 1,100 newly detected ones have been added to those previously known, and a great number of errors and discrepancies in their positions have been recognised and cleared up. It was obviously desirable that the scattered knowledge thus gained should be made readily available, especially since several observatories furnished, or about to be furnished, with first-rate instruments have taken up the study of the nebulae; and this useful task has now been accomplished by Dr. Dreyer, whose position as astronomer at Lord Rosse's observatory gave him special facilities as well as inducements for working at it. In a paper read more than a year ago before the Royal Irish Academy, and lately published in vol. xxvi. of their *Transactions*, Dr. Dreyer supplies "Notes and Corrections to the General Catalogue of Nebulae and Clusters of Stars" in more than four hundred pages, and gives then a Continuation of the General Catalogue, which embodies the positions of all the newly detected nebulae, and raises the whole number of known nebulae and clusters from 5,079 to 6,251. This number is at present

somewhat too high, as it comprises a series of cases in which nebulae have been entered by mistake, or in which their identity with known ones has been overlooked; but, in view of the prevailing activity, it promises to increase considerably before long. All who are engaged in observations of nebulae or of comets will readily appreciate the possession of Dr. Dreyer's valuable paper.

Star-Gauging.—If the speculations respecting the real distribution of the stars in the universe are to be built up on a firm foundation, it is necessary that our knowledge of the apparent distribution of the stars of various magnitudes on the surface of the sphere should be greatly increased. At present we possess in the atlas of the *Bonner Durchmusterung* a complete and trustworthy representation of the stars of the northern hemisphere down to the ninth or the 9.2 magnitude of the scale there adopted, and an incomplete representation of a great many stars below that magnitude. Sooner or later the wearisome task will have to be taken in hand of ascertaining by proper observations with a powerful telescope the actual number of stars of different magnitudes, down to the faintest, in each small portion of at least a great part of the sphere. If only the numbers of all stars visible in each small portion are counted without distinction of brightness, telescopes of various apertures for various limits of visibility will have to be employed. Argelander, when comparing the numbers of stars visible to the naked eye of those observed in the telescope of the *Durchmusterung*, and the estimated numbers of those seen by the Herschels in their gauges, pointed out the uncertainty of the conclusions arising from the great leap between the small telescope of only three inches diameter employed in the observations for the *Durchmusterung* and the eighteen-inch telescope employed in the gauges, and he recommended observations with telescopes of intermediate size. The recommendation has been followed at the observatory at Milan by Prof. Celoria, who by the advice of Prof. Schiaparelli has for some years past been engaged upon a series of gaugings with a telescope of Plösel of nearly four inches aperture. The first results of his labours, referring to the zone between the equator and the sixth degree of northern declination, have been recently published in a paper "Sopra alcuni scandagli del cielo eseguiti all' osservatorio reale di Milano, e sulla distribuzione generale delle stelle nello spazio." The zone being subdivided into twenty-one sub-zones, each 17' broad, the numbers of stars are given in each sub-zone for every space of 10m. in right ascension, and also for every hour. The results are exhibited graphically by a series of curves, a separate curve being first given for every sub-zone, and then the whole breadth of six degrees being represented by a general curve, which is made comparable with the corresponding curves representing the results of Argelander's *Uranometria*, of the *Durchmusterung*, and of Herschel's gauges. There is a fair agreement in the chief features of these curves, the influence of the Milky Way being well marked, though the degree of this influence is of course conspicuously strong in the curve representing the results of the most powerful telescope. The continuation of Prof. Celoria's *Scandagli* is very much to be desired.

The planet *Mercury*, which is just now for some evenings most favourably situated for being seen by the naked eye after sunset, will cross the sun's disc on May 6. It will touch the disc at 3h. 12m., and will about three minutes later appear projected upon it. The egress does not take place till after sunset.

PHILOLOGY.

In the *Neue Jahrbücher*, vols. cxv. and cxvi., part 12, Susemihl has an interesting paper on Gorgias and his influence on Attic prose, in which

he comes independently to the same conclusion as Wilamowitz, namely, that Gorgias was actually the creator of that branch of composition. E. Willmann gives a summary of recent works on the philosophy of the stoic Zeno. C. Schrader takes up anew the question of the date of the defeat of Varus, deciding for 9 A.D. H. Hagen communicates two hitherto unpublished catalogues of mediaeval libraries found among the manuscripts at Geneva. Notes on Dionysius of Halicarnassus are contributed by G. Meutzner, on Catullus by Roseberg, and on Livy by Völkel. In the educational section of this number, Eichhoff continues his very interesting criticisms on German translations of the classical poets, taking this time the *Bumetides* of Aeschylus; and Pröhle brings the publication of the correspondence of Lessing, Gleim, &c., to a conclusion. The following number of this journal (the first of vols. cxvii. and cxviii.) has three important essays, the first an elaborate and on the whole favourable review (continued and completed in the next number) of Christian Muff's *Chorische Technik des Sophokles*; the second, some original notes by Bergk ("Lese Früchte") on Hesiod, on the *scholia* to Pindar, and on the *Acharnians* of Aristophanes; the third, a series of grammatical remarks by Usener on the Latin participle, on *deidm*, on *temptum*, on the Greek adverbs in *-rev*, on *δη ἄν*, on the metre of Theognis, and on *hypostasis*, or the formation of independent out of dependent words (e.g., *perfidus* from *per fidem*). In the following number, O. Schneider continues his notes on Aristophanes, Tohte has remarks on Lucretius, Plüsch on Horace, and Baehrens on one of the Virgilian *catalecta*. The educational section of the last two numbers has some interesting matter. Fable, in an essay entitled "Altes und Neues aus der Schule," makes a number of suggestions with the view of raising the position of assistant-masters in the German schools. Hölsche gives an account of that remarkable institution the Karlschule at Stuttgart; Pröhle contributes a letter of Gleim's, throwing light on the battle of Kollin and the behaviour there of Moritz of Dessau. H. Holstein prints some previously unpublished correspondence between Funk and Klopstock, Didolf has an important article (to be continued in the next number) on the resolutions of the orthographical conference recently held at Berlin, and Radtke contributes a history of the Latin school at Goldberg in Silesia, which was reorganised last year with the idea of its ultimately developing into a gymnasium. Otto continues and finishes his report on the transactions of the Wiesbaden conference of scholars and schoolmasters.

Die beiden ältesten Provenzalischen Grammatiken, herausgegeben von Edmund Stengel (Marburg: Elwert), is a most welcome new edition of the two earliest (thirteenth century) grammars of any of the Romanic dialects. For the first time these invaluable treatises on the language of the troubadours are faithfully printed—a great part in two parallel columns—according to the best (Florence) MSS., with the variants of the others, including that recently discovered at Madrid; so as, in Prof. Stengel's words, to afford a secure foundation for further studies and efforts at emendation. The text, which comprises *Lo Donatz Provenzals* (generally ascribed—the editor thinks, wrongly—to Uc Faidit), with its vocabularies and rhyme-lists, and *Las Rases de Trobar* of Raimon Vidal, with a short Provençal-Italian glossary appended to the latter in one MS., occupies less than half the book; the next fifty-four pages contain, not only the variants, but all the explanations and new readings which have hitherto been proposed, as well as those of the present editor. The Preface gives a short account of the MSS. and of the unsatisfactory previous editions, and the work concludes with indexes of names and words, the latter, which contains about 2,500 entries, constituting a useful Provençal glossary. Altogether Prof. Stengel has produced a very complete and satis-

factory work, whose value will be fully appreciated by Romanic philologists.

Die Provenzalische Blumenlese der Chigiana, Abdruck von Edmund Stengel (same publisher), is a print of the hitherto unpublished collection of Provençal poetry contained in a MS. of Prince Chigi's library at Rome, with some gaps filled up from an early complete copy in the Riccardian at Florence. The text is an orthographically-faithful copy of the MS., column for column and line for line, and is accompanied by several pages of remarks and variants, and by a Concordance showing where each poem occurs in other MSS. Prof. Stengel's careful print is an acceptable contribution to our materials for studying the early literature of the South of France; and it is gratifying to see that in this work, as in the one noticed above, he has recognised practically the importance of philologists being put in possession of unaltered transcripts of the MS. evidence.

MEETINGS OF SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE.—(Friday, April 5.)

SIR JOHN MACLEAN, F.S.A., V.-P., in the Chair. The chairman spoke of the great loss the Institute had sustained by the death of Sir Gilbert Scott.—Mr. C. E. Keyser then read the conclusion of his paper "On the Mural and Decorative Paintings in Canterbury Cathedral."—A memoir by Mr. T. Watkin "On Britanno-Roman Inscriptions discovered in 1877," was taken as read. This was the second of Mr. Watkin's valuable annual series.—Canon Venables gave an account of and exhibited the MS. Chronicle of the Cistercian Abbey of Louth Park, in Lincolnshire. This was a folio of twelve leaves, incomplete at the beginning. It was noticed that the water-mark of the paper was the same as that of the hall book of King's Lynn, of 31 Henry VI. (1452). The first page of the MS. begins with the close of the *tertia aetas* of the world's history—the epoch of Samuel and Saul. It goes regularly on to the fourth, fifth, and sixth *aetas*, the age of the Crucifixion, and so on, with a general summary of civil and ecclesiastical history up to the verso of folio 5, when a regular tabular chronicle begins year by year, commencing with 1067. The special purpose of the Chronicle, however, begins with 1139, the date of the foundation of the Abbey. Canon Venables gave an interesting *résumé* of the contents of the Chronicle, ending in 1413 with the death of Henry IV. It was related how the MS. had long been missing, but had lately been rediscovered among the effects of the late Mr. Harrod.—Mr. R. S. Ferguson exhibited a bronze female bust of Roman workmanship, four inches high. This beautiful work had been recently found in the bed of the River Eden, near Carlisle. It was hollow, and had formerly a hinged lid on the top of the head; loops for suspension remain at the side. It was considered that it had served the purpose of a receptacle for oil, to be suspended from a lamp by chains. Another bronze bust was exhibited from the same locality. Mr. Ferguson also sent a remarkably beautiful Roman bronze figure of a bat, with the wings extended over its head in the form of an acanthus leaf. He also exhibited two plumbago moulds of the time of Henry VII., for the manufacture of base coin of that period. Mr. Ferguson explained from his own practical experience as a base coin—with these identical moulds—the exact manner in which they must have been used, and pointed out the great ingenuity that had been shown in their manipulation for dishonest purposes. Three of the coins were forgeries in the York Mint, the other was a groat of Richard III. These counterfeits were discovered in 1865 at Netherwasdale, in Cumberland. Mr. Ferguson also exhibited a box of silver money weights in low standard silver, fifteen in number, one of them being for the purpose of weighing against the Turkish ducat.—Mr. J. A. Sparvel-Bayly exhibited a bronze celt, Roman pottery and other pottery, lately found near Bilericay, and read a careful account of Roman and other discoveries in the district.—Mr. Hartshorne exhibited a painted glass roundel, successively the property of Horace Walpole, Mr. Cole, and Mr. Kerrich, said to be the work of Lucas of Leyden, and another roundel representing the siege of a town.—Mr. Bernard Smith sent two *porte-couteaux* for the

bill-hook, carried by the wild tribes in the Deccan, and a Maori title-deed, carved in a piece of green jade, having a remarkable *chatoyant* lustre.—Canon Venables exhibited photographs of the house of Aaron the Jew, at Lincoln, now being rebuilt, and gave a description of the building.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, April 9.)

JOHN EVANS, Esq., D.C.L., F.R.S., President, in the Chair. Mr. W. M. Flinders-Petrie read a paper "On Inductive Metrology," the purpose of which, as explained by him, is to deduce the units of measure employed by ancient peoples from the dimensions of existing remains. Where units derived from several different buildings coincide, a high probability of the accuracy of the resulting unit is obtained. This principle has been tested by application to the monuments existing among the peoples of the Mediterranean. Mr. Petrie had also applied it to the earthworks of this country. At Hill Devereux he had obtained a unit of 691 inches. At Steeple Langford a unit had been derived which varied only by five inches. Near Orcheston is an earthwork forming a perfect ellipse. From this Mr. Petrie argued a considerable knowledge of mensuration on the part of the flint-workers by whom it had been constructed. He urged the necessity of accurate measurement on the part of observers.—Mr. E. B. Tylor read a paper "On the Game of Patolli in ancient Mexico, and its probable Asiatic Origin." The game is a combination of dice and draughts. It is similar to a game called "Putecheese," in use in India, played by throwing covies on to a board divided into squares of a certain pattern. So devoted are the natives to this game that a story is told of a provincial governor who habitually won back his servants' wages from them at it, and thus got served for nothing.

LONDON MATHEMATICAL SOCIETY. (Thursday, April 11.)

C. W. MERRIFIELD, Esq., F.R.S., V.-P. in the Chair. Prof. H. J. S. Smith, F.R.S., V.-P., read two papers: Second notice on the characteristics of the modular curves, and a note relating to the theory of the division of the circle. Prof. Cayley spoke on the subject of both papers, asking, in the course of his remarks, whether a solution had been effected for the inscription of a regular heptagon assuming the trisection of an angle. Mr. Tucker read a letter from Prof. Tait, in which he stated that by a simple *physical* process he could easily manufacture any number of definite integrals similar to the following:—

$$\int_0^\pi \int_0^\pi \sin \theta \, d\phi \, d\theta \frac{r^2 - a^2 - \lambda^2 + 2a\lambda \cos \theta}{[r^2 + a^2 + \lambda^2 - 2a\lambda \cos \theta - 2r\lambda \cos a + 2a\lambda(\cos a \cos \theta - \sin a \sin \theta \cos \phi)]^{\frac{3}{2}}} \\ = \frac{2\pi(r^2 - \lambda^2)}{(r^2 + \lambda^2 - 2r\lambda \cos a)^{\frac{3}{2}}}.$$

The principle was not stated because he wished to know whether the solution could be easily effected by direct processes.—Mr. Tucker then read an abstract of a paper by Prof. Minchin on the astatic conditions of a body acted on by given forces. When a body is acted on by given forces applied at given points in the body, if it is in equilibrium, it will under certain conditions remain so when it is displaced in any manner, each force retaining its magnitude, direction, and points of application in the body. The requisite conditions are called the astatic conditions. The investigation of them by ordinary Cartesian methods is given in Moigno's *Statique* at great length. Prof. Minchin's paper treats them by elementary quaternion methods, and adds a few geometrical results not noticed by Moigno. The paper also contains a proof of Minding's theorem, viz. that in certain positions of displacement of the body, the given forces reduce to a single resultant force; and when this happens, the line of action of the single force intersects both focal conics of a certain quadric, having for centre the centre of the central plane, and this plane for one of its principal planes. The Secretary then read part of a paper by Mr. C. Leudesdorf on certain extensions of Frullani's theorem. The object of the paper is to supplement two papers communicated by Mr. E. B. Elliott, and printed in the Society's *Proceedings*.

SOCIETY OF ANTIQUARIES.—(Thursday, April 11.)

DR. W. SMITH, V.-P., in the Chair. The Rev. F. E. Warren, Vice-President of St. John's College, Oxford, read a paper on a Greek Manuscript belonging to Mr. David Laing, which contains constitutions and rules for a monastery founded by Neophytus, a monk of Cyprus (c. A.D. 1209). The MS., which is on vellum, containing eighty-five leaves, and has lost eighteen, was transcribed by one Basil, a Cyprian monk, in the year 1214, and is signed by Neophytus. The author gives a few particulars of his own history, how his thirst for education, which was not to be had outside a monastery, led him to run away on the eve of a marriage which his parents had arranged for him. After five years' monastic life, he started alone on a pilgrimage to the Holy Land. On his return, after visiting Cyprus, he went to Paphos, where he was imprisoned as a deserter, and being released, founded the monastery, of which this volume contains the constitution. A catalogue of the library is appended, containing only sixteen books, which are theological. Mr. Warren gave a full account of the palaeographical and philological peculiarities of the volume, which will probably be published shortly. Mr. Freshfield called the attention of the meeting to another work by Neophytus, which is printed in Migne's *Patrologiae Cursus*, being a short history of the taking of Cyprus by Richard I., on his way to the Holy Land.—Mr. Nesbitt exhibited the silver matrix of a seal of the town of Delitsch; a seal of the family of Pecci of Sienna, the device of which is a woman holding a shield, bearing on a bend three stars; a silver seal, with a face to the right, and the letters M. N.; and the handle of an Etruscan dagger, terminating in a lion's head, made of Chiusi ware.—Mr. Leveson Gower exhibited a sampler of the seventeenth century, which he had bought at Limpsfield, containing flowers, a female figure, and the alphabet as far as the letter T.

FINE ART.

Notes on Irish Architecture. By Edwin, Third Earl of Dunraven. Edited by Margaret Stokes. Vol. II. (London: George Bell & Sons, 1877.)

THE work which Miss Stokes has just finished is a complete introduction to the study of early Irish architecture. It contains descriptions, illustrated by autotypes from photographs or by accurate drawings, of more than one hundred Irish buildings. Side by side with the descriptions are extracts from chronicles which tell the history of the localities and of the structures. The growth of the style can be observed in detail in the pictures, and at the same time determined in date by the records. The date of many of the buildings can thus be fixed as accurately as is possible in the absence of actual fabric accounts. At the end of the present volume are some excellent essays by Miss Stokes, which contain her general conclusions on the architecture described in the book. These are accompanied by chronological tables and by a map which shows the order and direction of the chief Danish incursions, and which is intended to support the hypothesis that it was these incursions which led ecclesiastics to build the lofty detached steeples called Round Towers for the protection of their lives and valuables from a hurried attack.

The earliest ecclesiastical buildings in Ireland are domed huts built of loose uncut stones. Outside they look like cairns, and their only ornamentation is a cross formed in the wall by white quartz stones. A small hole serves as window, and the doorway has a lintel of one great block. Perfect examples of such structures exist on the Great Scelig, an island off the coast of Kerry. In

course of time the architects learnt to make more regular exteriors, and their buildings were oblong, with well-marked angles and a roof-ridge, instead of being mere round-topped stone beehives. The doorway was refined, but its lintel was still a single horizontal block, and no mortar was used. The style had begun with a stone roof, and the difficulties of construction which this roof brought with it prevented the erection of large buildings. The greater size of the stones, their dressing and the more regular laying of courses, were the next improvements. Eastern and western buttresses and projecting stones at the angles were features of this stage. The sides of the doorways, as in the earlier buildings, were inclined inwards. In the next series the features were ornamented, and gradually the quaint interlaced decoration with animals' heads, which the artists of the time worked first perhaps in metal, was applied to enrich all the opportunities which the structure presented. The doors were arched and their orders elaborately carved. The window openings were similarly decorated, and were increased in size and number. The roof was still stone, but it was chambered, and the greater lightness allowed the height of the walls to be increased. At the same time detached steeples were built, and gradually came to be as essential to a large ecclesiastical establishment as the chapter-house was to an English minster. A great stone cross with a circle, and richly carved in panels, was another external and detached characteristic of an Irish church. Cormac's Chapel, of which several plates are given, is the best example of this last period, and shows what Irish architecture attained while the kingdom was yet purely Celtic. This church has a nave thirty feet long and a chancel of less than half that length. At the east end of the nave there is a small square tower on each side. The chief entrance is the north door, which has a rich shallow porch, not unlike many Norman doorways in England. There is a handsome exterior corbel table, and the walls, without as well as within, are decorated with arcades of round arches with zigzag and other mouldings. "The chancel arch is of four orders, with roll mouldings outside them, and a hollow space running round the arch and down each side, studded with faces in high relief, which, to judge from their varying character, must have been meant for portraits." The chancel is of the same general character as the nave, but "it is worthy of note that all the decorated features of the nave are square or angular, those in the chancel are round." At the end of the chancel is a small arched recess. Beside this church stands a Round Tower and a group of later buildings. Cormac's Chapel is the finest church of the Irish, and it has a site worthy of it. It stands on a mass of rock, rising abruptly in the middle of a rich plain, bounded on the north and on the south by the frontier mountains of the Dal Cais and of the Eoghanacht, the two great tribes who alternately came down to Cashel to give a chief-king to Munster. It is a ring of the latter tribe, Cormac MacCarthy, from whom the church takes its name. It was finished in 1134.

This building and the continuous series of

earlier churches shown in this book prove that, to whatever misery the incursions of the Danes may have given rise, they did not bring to a standstill the intellectual development of the country, as some writers have supposed. There are other works of art among the best of their kind of this period. The Cross of Cong, a marvellous example of fine interlaced metal-work, perfect in the finish of its details, was completed, as is known from the artificer's inscription, in 1123. The beautiful crozier of Lismore was made a few years earlier. The manuscript of Maelbrigte in the British Museum, which mentions incidentally the death of the builder of Cormac's Chapel, was written in 1138, and is inferior in the boldness of its designs to some earlier illuminated works, it is, nevertheless, an unsurpassed example of minute, brilliant, and regular manuscript art. Leabhar na Huidri, the largest early collection of literature in Irish, is of the same period, since its scribe is known to have died in 1106. These examples show the value of the records of art and of literature in general history, for they prove beyond doubt that the century and a-half following the ruin of the Danish interest in 1014 was a time of intellectual vigour. The chief effect of the Danish wars was the destruction of a sort of balance of power which had prevailed among the larger tribes. Literature and art flourished in spite of the wars, and only ceased to grow in their original direction when met by powerful external influences of their own kind. Miss Stokes judiciously gives a chronological table of examples of Irish architecture, sculpture and metal-work in parallel columns.

No work on Irish architecture would have been complete without a detailed account of the Round Towers. Lord Dunraven's book gives autotype plates of eighteen. One hundred and eight round towers are known, some perfect, some half ruined, some reduced to their foundations. They exhibit, as is here shown for the first time, four distinct styles. In the first, rough undressed stones are used; in the second, roughly hammer-dressed stones in irregular courses; in the third, dressed stones in horizontal courses; and in the fourth, ashlar masonry. The towers of Antrim, Clones, Kilkenny, and Kells are easily accessible examples of these styles in the order in which they are named. This classification is unfortunately not sufficient to fix absolutely the period of a tower. There is a difficult example at Drumlane, in Cavan, where a round tower, beautifully situated on a curious rounded green ridge rising from a lake, exhibits a sharp contrast of style in its masonry. The lower part is of fine well-dressed stones, the upper part of rubble. Miss Stokes' classification leads her to the generalisation that the earliest towers date from the tenth century, an important addition to our knowledge about them.

Lord Dunraven's *Notes on Irish Architecture*, with their admirable illustrations, are among the most important contributions of our time to the history of Ireland, and it is not too much to say of Miss Stokes' share in the work that she has done hardly less for Irish art than her brother for Irish philology.

NORMAN MOORE.

THE WATER-COLOUR INSTITUTE.

THIS gallery opened to the public on April 15. The general aspect of the walls—the picture paper-patterning, as one might term it—is depressingly flimsy; little or nothing strikes the eye as strongly and substantially wrought. Yet on inspection there is a moderate proportion of sound and approvable work, and the exhibition as a whole may pass as not much below the average. The chief strength of the display lies in the contributions of Messrs. Wolf, Linton, Gow, and Aumonier.

Mr. Wolf manages to get into his picture of birds more of what constitutes an essential pictorial idea, more of an intrinsic purpose made visible in form and act, than we find anywhere else in the gallery. *Arctic Summer, White Falcons*, is his subject: he makes it at once grand and singular, and evinces his invariable excellence of strict natural-history exactness. It is a scene of rocky height and space: in the distance, right opposite the eye, snowy ridges and peaks in warm light under a pale sky; in front, a crag jutting out, starred with a rich profusion of purple and of yellow flowers—the fine drawing of which, in many phases of foreshortening, deserves attention. Far off as yet, but approaching momentarily nearer, a falcon is winging forward, holding in his talons a ptarmigan or some similar bird: his mate, on her rocky ledge, flaps her vast and spotted wings, fans out her tail, and rises on tip-toe with protrusive claws which blab of the fierce, triumphant grip which in a few minutes they will be giving to the prey. Two other falcons, only less eager and busy at the sight, are a little below: if they interfere when the moment comes, they may be made to rue their presumption. If raptorial birds were picture-collectors, or still enacted the connoisseur as their kind did in the days of Zeuxis and Apelles, this picture would hold a place of honour in the gallery of His Majesty King Aquila. Mr. Linton's painting, named *Emigrés*, is probably, in dramatic subject-matter and expression, the most important thing he has yet given us: it yields to some precursors, but not very greatly yields, in point of skilful putting-together and working-up. One of the noted aristocrats of the French Revolution, accompanied by wife and baby, with pursuit hot at their heels, and guillotine at the end of the perspective, is offering a handful of gold to tempt a young coasting skipper—perhaps in the *Pas de Calais*—to waft them over to safe harbourage: the stalwart man rumpled his cap with hard hands, and bangs his head, "letting *I dare not wait upon I would*." This figure is in a high degree excellent: reluctance to accept, from a sense of risk and possibly of duty, and reluctance to refuse, from a sense of commiseration not of course unmixed with greed, being stamped palpably upon face and action. The only other personage in the group is the skipper's childish daughter couched on the floor near the tall opening of the fireplace, with its crackling logs. The whole of the fugitives' luggage is contained in a very limp portmanteau. We doubt whether Mr. Linton ought to have allowed his *Emigrés* to retain the long locks and wisps of hair which serve to mark him out as a man of fashion: his object being evasion and inconspicuousness, it might rather have been his wisdom to bring a pair of scissors into requisition. Mr. Gow's little picture shows his executive skill at its best: not inferior indeed to Mr. Linton's, though much less forcible and broad. He portrays *A Loyal Bird* in the time of the Cavaliers and Roundheads—at a date in the civil conflict when (as we are probably to understand) the regal fortunes have declined, and the Puritans, with their Noll and other rank rebels, are in the ascendant. The loyal bird is a caged raven in the courtyard of a hostelry: his outcroaked gibes and anathemas on the psalm-snuffing rascals are music to the ears, and balm to the hearts, of two cavaliers who

listen to him—a bitter delight is on the face of the foremost personage. A third is seated at table with a flagon, and there are some smaller figures within doors. This well-studied though roughly-treated picture might win a word of approval from Meissonier. Mr. Aumonier sends three landscapes, all of very superior quality—the least remarkable being the one entitled *Milking-time*. *The Way to the Boats*, with figures of fishing-folk descending shoreward from the heaped-up houses of the Devonian or Cornish cliff-village, is warm and good in tone, with plenty of varied and attractive colour; the figures themselves also are very well put in, efficient as related to the landscape, without being carried further than is fairly needed in this form of art. Fully equal to this, in its less salient subject-matter and mode of treatment, is the *Walberswick, Suffolk*; with red-roofed houses beyond the quiet river, and a boat and nets lending significance to the foreground.

Among the figure-painters, after Messrs. Linton and Gow just named, we may rank Messrs. Clausen, Tenniel, Small, and C. Green. Mr. Clausen, indeed, yields to no one here for sense of what is natural or picture-like: his *Waiting to Confess*, a battered old woman and a girl of ten seated in church, until the confessional, now occupied by another woman, shall be vacant, just hits the mark of what is required in so simple yet far from unsuggestive a subject. *Gossip*, at the cottage-door of a Dutch fisherman—all the males of the community being away at sea—is also very much what it should be. Mr. Tenniel treats, in *Pygmalion*, an ambitious theme, which would tax the powers of the most imaginative designer, and Tenniel, though thoughtful and judicious, is not imaginative. The statue woman has now flushed with life over face and bosom, while the lower portion of the frame still remains stony; her lids are lowered, and her mouth has not yet opened to word or kiss; the sculptor, haggard with his hopeless yearnings, has clasped his hands behind the figure, and looks up, hardly believing his eyes—his countenance might well have been of a less ungainly type. The arrangement of light and shadow is well combined, and serviceable to the sentiment of the work. Mr. Small's picture is named *The Last Offer*, and probably represents (though the catalogue gives no hint of this) a scene from Victor Hugo's *Quatrevingt-treize*. The parlementaire of the Republican army holding a white cloth in his right hand, and with appealing gesture in his left, is addressing the insurgents; behind him, only awaiting the word of command to blow the blast of battle and no quarter, stands the brown-clothed ragged trumpeter, a very well-conceived figure, and the army has mustered behind. There is much to praise in this composition; but it hardly makes a picture, inasmuch as Mr. Small does not show us any person to whom his "last offer" is addressed, and thus the treatment is maimed, almost to the point of eccentricity. Mr. Green paints, as usual, a subject with a considerable number of figures, all carefully individualised and attentively painted—*The Sailors' Hornpipe*; the scene is an East-end drinking house, of moderate respectability; the aged and business-like fiddler is well realised; also the rather hard set face of the dancing seaman, who will not relax into a smile, but leaves hilarity to the lookers on. Other figure-pieces of some mark are *Peggotty's Wedding*, by Mr. Staniland, with less of native humour than would fully carry out the subject; *Widowed and Fatherless*, by Mr. T. W. Wilson, one of his accustomed Dutch domestic pieces, with somewhat more self-display in execution than usual; *A Children's Garden-Party*, by Miss Gow; *A Musical Party*, towards the middle of the last century, by Mr. Towneley Green, rather stiff and inanimate, but this is evidently not unintentional on the artist's part; *The Reader*, by Mr. Bale, a lady in yellow satin; and *Ready for the Dance*, a Pompeian prettiness by Mr. Augustus Bouvier.

In the landscape section Mr. Hine maintains his wonted superiority: his *Old Chalk-Pit, Eastbourne*, and *Cliffs at Cuckmere, Sussex*, are very characteristic specimens—the latter somewhat injured, so far as effect on the eye is concerned, by the great space of white chalk in the centre of the picture. Messrs. Edmund Warren (*Summer Shade*), Holloway (*Old Palace, Maidstone*, and *Evening at Arnside*), Penson (*An Old River-Bed*), Whympier (*Sands of Lamentation near Aber*, and *Stokesay Castle*), and Hayes (*French Fishing Luggers*), may also be named; and, in still-life, Mrs. Angell and Mr. Sherrin.

W. M. ROSETTIL.

MODERN PAINTING.

Two exhibitions of paintings, and even of a little sculpture, were recently open, in two clubs of which I have frequently spoken to you. Although not of equal importance, each has its special interest.

The club in the Rue St. Amand—which has been jocularly named the "Crémérie," whence it might be inferred that its cuisine is neither abundant nor expensive—is yet in the days of its youth. It is this circumstance that authorises us to offer it some advice—for example, not to hand over its artistic interests to a committee more reactionary, and more old-fashioned in matters of art, than even the most venerable academicians; not to exhibit so many works, and to select them more carefully; and, lastly, to require of those of its members who belong also to the club of the Place Vendôme (called the "Mirilitons" on account of the music there) that they should distribute their works fairly—that is to say, that they should not bestow on one their best pictures, and on the other only their slightest sketches.

The subject of exhibitions organised by clubs is just now receiving much attention among us from those critics whose thoughts are directed to the general organisation of the Beaux-Arts. It will be difficult to induce the Government to give up the direction of the Fine Arts, because that direction becomes a political engine in its hands. It is difficult also to make a nation but newly democratised understand that the State ought not always to continue the traditions of the monarchy, but ought to allow artists to strengthen themselves by the exercise of their liberty. In the meanwhile the annual Salons have become a great weariness to the public. That public sees plainly that they are only huge sales with guarantees and privileges such as are not accorded to any other kind of intellectual merchandise. It clearly perceives that under the pretext of encouraging "high art" encouragement is only given to a high degree of mediocrity. One can but hope that the public will come to understand how well party exhibitions, got up by rival sets, will act as salutary checks to the annual Salons, and will restore these to their position of honour, while giving to truly national talent more chance of triumph over the *savants*, falsely so-called, who return from Rome exhausted or overbearing. These great questions are now under consideration by a committee of the Chamber. A Parliamentary committee has been appointed, under the presidency of M. Charton, to consider the reorganisation of the *personnel* of the administration of the Beaux-Arts. This is by no means a question of political feeling, although this administration is the same as it was under the Empire, which is the same thing as saying that it is justly suspected of bearing the greatest grudge against existing institutions, and of impeding their action. M. de Chennevières is much bullied on account of the clerical decoration of the Panthéon. Nevertheless he is an able man. Perhaps, in spite of all, he will retain the direction of the Beaux-Arts until the Great Exhibition, owing to the dread of too far disorganising the service before this solemnity. In any case it is almost certain

that the management of theatrical affairs will in future be assigned to a distinct director.

I should think that you must feel a good deal surprised at all these questions, resting as they do on centralisation: these remains of high aristocratic functions, which have outlived the wreck of the *ancien régime*. Some day I will send you our Fine Arts budget. You will understand its machinery better by the aid of figures.

To return to our clubs. I will briefly review their characteristic exhibits. M. Bastien Lepage, and M. Mathéy, both of whom may still be classed among the young painters, contribute each a woman's portrait. M. Bastien Lepage, who has much talent but whose carelessness of execution has called forth criticism, has done himself credit. M. Mathéy, whose endeavours to secure careless ease in the attitudes of his sitters used to amount to affectation, has this time achieved a lifelike naturalness without loss of simplicity. But after awarding praise to these painters, and to the landscapists Babel du Poizat and Lansyer, we are obliged to criticise. We do not like the task. We think it seldom profitable. How, for example, can we prevent the unlucky students of the School of Rome—who have been subjected, at the Villa Medici, to a ruinous system of perpetual copying, and who only look on nature as young priests—how are we to deter them from painting cadaverous portraits, or those wretched little Italian girls, pale, weary, and plain, who drag from studio to studio their faded finery, their laziness, and their vicious countenances? It would be a waste of ink to make the attempt. But we may ask of such a powerful colourist as M. J. P. Laurens to send in future studies rather less harsh than that standing personage dressed in yellow; and of a refined colourist like M. Henner not to content himself with an effect of light glancing on the smooth cheeks and soft hair of a pretty fair head, but to give us rather more indication of internal construction, and, finally, we may ask of a skilful painter like M. Bonnat not to plaster his friends' faces with red and yellow as if he used a trowel, because, at a distance, it gives their complexions the appearance of skin-disease.

The company of the Place Vendôme is in far better order, and although older in years, may be pronounced younger in point of talent and appearance. This year M. Meissonier was president of the committee that organised this exhibition. Great praise is due to him.

The portraits are numerous, and worthy of remark. M. Carolus Duran takes the lead with his portrait of M. Leroy Beaulieu, a young man, with regular features, black pointed beard, and an intelligent countenance, seated unaffectedly in a *cabinet de travail*. The quality of the flesh tints is really admirable, as is also the skilful manipulation. M. Léon Bonnat has depicted in a very spirited style the countenance of one of his artist friends, M. Ed. Dubufe. This is a luminous study, and the complexion is well-enough worked up, but on the bust, which is but slightly sketched in with bitumen, there breaks out a red patch of indefinite form, and which is not so much like the rosette of an officer of the Legion of Honour as a wafer, which, blown by the wind, has stuck by chance upon the canvas. M. Clairin, Regnault's travelling companion in Spain and Algeria, has painted a small full-length portrait of M. Emile de Girardin, which, by a privilege belonging only to men of talent, represents the illustrious publicist as at least thirty years younger than his age, and is yet a good likeness.

M. A. de Nittis obtains the most legitimate success by means of two pictures painted in London. His powers of observation grow keener every day. His view of the Bank of England, with the well-marked types of character that hurry along the pavement, the carriages of all kinds crossing one another's path in every direction, the solemn bearded policemen helping old ladies safely over the crossing, and the fog

hat marks the outline of your monuments, is so lifelike a composition that it is readily understood at first sight, and calls forth the applause or the curiosity of the public, who feel instinctively that the portrait is correct. In another painting which, unfortunately, is not well lighted) M. de Nittis has portrayed a scene in St. James's Park—the water rippled by a pleasure-boat, at the back of which a fair lady is seated; the black swans, the delicate verdure of the trees hat rise on the opposite bank, the buildings in the background glowing in a clear soft light under a hazy sky; the whole is steeped in a poetic atmosphere which touches me the more because I have so often felt its effect. This poetic feeling, so which your poets have given such admirable expression, is little felt in France, and your national pride owes a debt of gratitude to M. de Nittis for having, by the aid of painting, brought it before the eyes of the French public, so little accustomed to travel or to read!

The average quality of this exhibition is, as I have said, very high. M. Detaille has seldom composed with such naturalness or painted with such breadth as in *L'Alerte*. During the war of 1870, in a village in the environs of Paris, a gendarme has hastened at full gallop to give information to some superior officers assembled in a house, who hurry out to listen to him. The actions and expressions are extremely well rendered. M. de Neuville seems to us less happy in his choice of episode, which shows us a priest, a landlord, and a postman "en route pour les prisons allemandes." It is to be regretted that certain artists should make a specialty of our disasters and of the barbarity of our conquerors; they should at least refrain from treating these in the style of episodic anecdotes.

M. Philippe Rousseau shows both knowledge and taste as a successor of Chardin. His reputation as a painter of what are very improperly called "natures-mortes" is well-established, but I do not remember ever to have seen a bit of his so broad in effect, so correct in tone, and so agreeable in colouring as that which he has named *Un fromage*. I trust that my readers are connoisseurs, and that they appreciate that delicious country produce of ours which is known as "le Fromage de Brie." It is one of these cheeses freshly cut, with its cream oozing from it as the juice oozes out of a fig, that M. Philippe Rousseau has judged worthy of being transmitted to posterity. Behind it, so as to attract attention, he has placed a white glass bottle filled with gherkins and those red pimentas prepared by our housekeepers which are sharper in flavour than your pickles.

But here I check myself, for the glowing phrases that these culinary *chefs d'œuvre* suggest are worthier of a gourmand than of a critic, and these two departments of life should never be confounded together.

PH. BURTY.

INDEX OF LETTERS AND OTHER DOCUMENTS ADDRESSED TO MICHELANGELO BUONARROTI, AND PRESERVED IN THE ARCHIVES OF THE CASA BUONARROTI, FLORENCE.

FREQUENT references have been made to the unpublished documents preserved in the Casa Buonarroti at Florence, which for the most part are letters addressed to Michelangelo by his numerous correspondents. It would be very desirable to publish these; and I have been allowed to copy a manuscript catalogue of them, which I now send to the ACADEMY thrown into the form of an index, the details of which are reduced in bulk so as not to occupy too much space, but which may suffice to draw attention to their number and probable interest. I have hitherto met with two difficulties with reference to every proposal for their publication. First, the copies of the documents must be purchased: I believe that a moderate sum would satisfy the owner. Secondly, the publication would not pay: which is very prob-

able. The publication, however, would have been freely undertaken at Berlin last year, had it been possible to obtain the MSS. gratis.

A number of these letters have already appeared; but a greater number have not been published. According to my calculation there are 687, without reckoning a small portion of the same collection which are not addressed to Michelangelo. It is reasonable to suppose that among so many documents there must be statements, allusions or hints of value to the literary critic. I have been allowed to copy a dozen of them, which I certainly could have made use of had I seen them at an earlier period.

A number of drawings and sketches by Michelangelo were only exhibited after the festival. No use of these was made when his Life was written in Italian, yet they are rich in suggestions and in the establishment of facts. For instance, I ventured to suggest that Michelangelo must have made working drawings for the quarrymen at Carrara, and so his attention was specially drawn to practical architecture during his enforced residence in the marble-quarries. I subsequently found several drawings of this description in the collection. His apparent habit of drawing architectural designs without scales, which I had commented upon, is amply illustrated by upwards of sixty drawings, to only one of which a scale is appended. A number of sketches of fortifications of profound interest would supply matter for an essay by a military engineer, while they copiously illustrate Michelangelo's ideas for the defence of Florence on more sides than San Miniato, and add to our knowledge of his proceedings during the siege. On one architectural sketch a few lines written by Michelangelo himself prove, beyond a possibility of doubt, that the tomb with the statues of Day and Night is that of Julius. I had before satisfied myself by careful measurement that the roughly blocked-out statues in the grotto in the Boboli gardens were no part of the monument of Julius, as is universally asserted; a drawing in the Casa Buonarroti shows clearly to my mind that they were intended for the new front of S. Lorenzo. A study of a problem of perspective shows what, at one time, were Michelangelo's ideas on this subject, and a very rude sketch suggests the method by which he calculated the increase of the proportions of statues, on the different stages of the Julian monument; or, possibly, as they rose tier above tier in the *Last Judgment*. No use was made of these and of other hints to be obtained from the same precious sources. It is not unreasonable to suppose that further study might also discover new light in the unpublished letters. I do not attempt to separate the published from the unpublished documents, but give the entire index as I have copied and arranged it, in the hope that someone will come forward willing to do himself honour by their publication. Careful reproductions of the sketches in the Casa Buonarroti would form an invaluable publication, and these, at all events, might find numerous purchasers, or the letters and reproductions might be published in one work.

C. HEATH WILSON.

A.—Aginensis, Cardinal of S. Pietro in Vincula, Rome: three letters, 1516-19. Agostino, Fra, Procurator of S. Pietro in Vincula, Rome, 1533. Allegri, Giusto di Maso, Pistoja, 1522. Ammanati, Bartolomeo: three letters, Florence, 1538 to 1561. Amatore, Il Fattorino, Casteldurante: two letters, 1561. Andrea and Domenico, marble-cutters, Florence, 1518. Anguisciola, Amilcare, Cremona: two letters, 1557-58. Angiolini, Bartolomeo, Rome: nineteen letters, 1521 to 1533. Anonymous, Florence, 1510. Antonio d'Orsino, Florence, 1525. Aretino, Pietro, Venice: four letters, 1537-45.

B.—Baccio d'Agnolo, Florence: four letters, 1515-16. Baccio di Montelupo, Florence, 1516. Balducci, Giovanni, Rome: three letters, 1506-08. Bandini, Pierantonio and Alemanno, Rome: a receipt, 1558. Barbazza, Bartolomeo, Bologna: two letters, 1528-29. Baroncelli, Francesco, Florence: 1542. Baroncelli, Baroncello, 1518. Beccatelli, Ludovico, Archbishop

of Ragusa: two letters, 1557-58. Belli, Valerio, gem-engraver, Vicenza, 1521. Bene del, Bartolomeo, Orleans, 1560. Bene del, Lorenzo, marble-cutter, Florence: a receipt, 1560. Benti, Donato, Pietrasanta, Pisa, and Seravezza: twenty-eight letters, 1517-21. Bini, Giovanni Francesco, Rome, 1533. Bisdomine, Simone di Taddeo, Naples, Rome and Florence: three letters, 1518-19. Bronzino, Agnolo, Florence, 1561. Brunelli, Giulio, Casteldurante, 1559. Bugiardini, Giuliano, Florence, 1532. Buonarroti, Buonarroto, Florence: twenty-two letters, 1507-18. Buonarroti, Giamondo, Florence and Settignano: three letters, 1516-31. Buonarroti, Ludovico, Settignano, Florence and S. Casciano: four letters, 1500-25. Buoninsegni, Domenico, Rome: twenty-one letters, 1516-20. Buoninsegni, Leonardo, 1517.

C.—Calcagni, Tiberio, Pisa, 1560. Campana, Francesco, Florence, 1526. Canossa da, Alessandro. A. Bianello de le quattro Castelli, 1520. Capelli, Giovanni, purveyor of the works of the cathedral, Florence, 1518. Capponi, Donato, Florence, 1529. Caravaggio, Fra Giovanni Pietro, Prior of S. Martino, Bologna: two letters, 1529. Catharine, Queen of France, Blois, 1559. Cavaliere Tommaso, Rome: three letters, 1533. Cenci, Bernardo, Rome, 1521. Cibo, the Cardinal, Ferrara, 1531. Clement VII., Rome, letter, brief, to Michelangelo. Colombe delle, Fra Lorenzo, Rome, 1516. Colonna, Vittoria, Sta. Catarina and Viterbo: five letters, 1546-48. Condi, Ascanio, Civitanuova, 1556. Cornelia, La, widow of Urbino, Casteldurante: twenty-five letters, 1557-60. Colonelli, Guido and Antonia, Casteldurante, 1559. Cosini, Silvio da Cepperello, Genoa: two letters, 1529-32.

D.—Dati, Niccolò, Florence, 1529. Dei, Orlando, Lyons, 1531. Doffi, Ludovico, Pisa, 1518. Doffi, Tommaso, Adrianople, 1519. Domenico di Sandro, Carrara: two letters, 1515-1518. Domenico di Giovanni di Bartino, Settignano, Carrara: two letters, 1523-24. Domenico di Settignano (Topolino), Carrara: seventeen letters, 1521-24. Durante, Francesco, Piacenza: three letters, 1538-41.

F.—Falcone, Silvio, Rome: two letters, 1514-17. Fattucci, Ser Giovanni Francesco, Rome and Florence: sixty-nine letters, 1523-40. Fazi, Bonifazio, Rome, 1517. Febo di Poggio, Florence, 1535. Ferrucci, Andrea di Pietro, Florence: three letters, 1517-18. Figiovanni, Battista, Florence: seven letters, 1517-32. Filicaja, D. Bartolomeo, Seravezza: seven letters, 1518. Francesco di Giovanni, Michele, Carrara, 1520. Francesco di Guido, Massa, 1528. Francesco I., King of France, 1546. Francesca, Suora, Abbess of Boldrone, Florence: two letters, 1529-33. Frizzi, Federigo, sculptor, Rome: six letters, 1519-22.

G.—Gaddi, Giovanni, Rome, 1532. Galvano di, Ser Niccolò, Carrara, 1524. Gamberelli, Ser Bernardo, Florence, 1525. Gellesi, Giovanni da Prato, Rome: eight letters, 1515-26. Gherardo di Michele da Settignano, Florence: two letters, 1523. Ghiberti, Vittorio: four letters, 1520-21. Giovanni dell'arte della Lana, Genoa, 1533. Girolamo di Carlo Scafauiolo, Pisa, 1519. Giulio II., Pope, Brief, 1506. Gondi, Piero, Florence, Ancona: three letters, 1528-25. Granacci, Francesco, Florence: two letters, 1508. Graziani, Massimo, Abbot of Camasone, 1518. Gremani, Cardinal, Rome, 1523. Guicciardini, Michele, Florence, 1540. Guicciardini, Niccolò, Florence, 1538.

J.—Jacopo d'Antonio di Maffiolo (called Caldana), Carrara, 1526.

L.—Lamporecchio, Pietro, Pietrasanta: three letters, 1516-17. Leonardo, Sellaio, Rome, Florence, Montelupo: seventy-eight letters, 1516-26. Leoni, Leone, Florence, Milan, Mantua: three letters, 1560-61. Lodi da, Agostino, Piacenza: three letters, 1536-38. Lombardelli, Lionardo, Carrara: two letters, 1517-18.

M.—Malenotti, Bastiano, Florence, 1557. Malvezzi, Matteo, and Fra Pietro di Caravaggio, Bologna, 1530. Manfredi, Messer Agnolo, Herald of the Signory, Florence, 1510. Marco di Bernardo Girardi and Francioni di S. Paolo, marble-cutter, Carrara: seven letters, 1521-23. Marmozzi, Lionardo, Florence, 1557. Marsili, Cristoforo, Rome, 1558. Martini, Luca, Pisa, 1560. Marzi, Pietro Paolo, Rome: three letters, 1521-31. Matteo del Cuccarello, Carrara: two letters, 1508-18. Matteo, Priest of St. Lorenzo, Florence, 1518. Medici, de', Fra Zanobi, Dominican, S. Miniato al Tedesco, 1525. Medici, de', Cardinal Giulio, Rome and the Mulliana: three letters, 1517-20. Melici, de', Veri, Commissioner-General, Pietrasanta: two letters, 1516-18. Medici, de', Cosmo,

Florence, Pisa, Leghorn: four letters, 1557-60. Michele di Pietro, Pisa: two letters, 1518. Michele d'Andrea di Guido, 1524. Mini, Antonio Barberino, Bologna, Piacenza, Lyons, Paris, 1531-32. Mini, Giovanni Battista, Florence, 1530-32. Montaguto di, Girolamo, Rome, 1526.

N.—Naldini, Domenico, Florence, 1521. Nasi, Ruberto, Florence, 1532. Niccolini, Bernardo, Rome, Florence, Orvieto: fifteen letters, 1516-32. Norchiati, Giovanni, 1532.

O.—Officiali, gli, of the Fabric of S. Petronio, Bologna, 1522. Operai, gli, of the Cathedral of Florence, 1519. Olanda, d', Francesco, Lisbon, 1553.

P.—Paccagli, Gabriello, Paris, 1519. Paesano, Piero, Di Argenta: three letters, 1529-32. Paganelli, Niccolò, Florence, 1528. Palla, Della, Battista, Florence: two letters, 1529. Paolo III., Pope, Rome: two Briefs, 1538-48. Pavia, the Cardinal, Ravenna, 1510. Pallizza or Pelliccia, Francesco, Carrara, 1518. Peri, Francesco, Pisa: three letters, 1518. Perini, Gherardo, Pesaro, Pisa: ten letters, 1518-22. Perini, Francesco, Rome, 1517. Piccolomini, Anton Maria, Siena, 1537. Pierantonio, Rome, 1532. Piloto, Il, goldsmith, Venice, 1525. Pollina (called), Jacopo and Giovanni (called Maestro Gianni), marble-cutters, Carrara: two letters, 1518. Pollina, Dato, and other marble-cutters, Carrara, 1521. Pollina, Bello and Leone, Carrara, 1520. Porta, Della, Giovanni Maria, Rome, 1532. Pucci, the Cardinal, Santi Quattro, 1533.

Q.—Quaratesi, Andrea, Pisa: three letters, 1530-32. Quindici, Leone, and Company, marble-cutters, Carrara, 1525.

R.—Ranieri, Cristofano, Florence: two letters, 1527-28. Reggio Da, Bernardino and Giovanni, painters, Rome, Reggio: three letters, 1520. Riccio, Del, Francesco: a receipt, 1545. Riccio, Luigi, Rome: four letters, 1542-47. Ricciarelli, Daniele, Florence, 1557. Rinieri, Giorgio, Rome, 1529. Rosso, Il, painter, Rome, 1526. Rosselli, Pietro, Rome: seven letters, 1506-26. Rustichi, Giovanni Francesco, Paris: two letters, 1532-34.

S.—Salviati, Jacopo, Florence, Rome: fourteen letters, 1516-25. Salviati, Cardinal Giovanni, Rome, 1531. Salviati, Battista, Camerata, 1526. Sansovino, Jacopo, Florence, Rome, Loreto: five letters, 1516-26. Sansovino, Andrea dal Monte Sansovino, Loreto: two letters, 1516-24. Sandro di Giovanni di Bertino di Sottignano, 1518. Scipione, marble-cutter, 1521. Sebastiano, Veneziano (called del Piombo): forty-one letters, 1522-33. Ser, Del Donato, Petraguano: four letters, 1523-37. Sera, Del Neri, Sottignano, 1523. Soderini, Niccolò Florence, 1521. Soderini, Pietro, Rome: five letters, 1516-18. Spina, Giovanni, Florence: three letters, 1524. Spatafora, Bartolomeo, Messina, 1560. Vasari, Giorgio, to Duke Cosmo: two letters, 1561. Giorgio Vasari to Ludovico Buonarroti, 1561.

NOTES ON ART AND ARCHAEOLOGY.

THE small water-colour picture by Turner, which Mr. and Mrs. Cowper-Temple, with some other friends of Mr. Ruskin, bought at the Munro sale, to be presented to that gentleman when convalescent, is the *Baths of Pfeffers*, in the Splügen Pass. On the day of the sale, the audience at Christie's were a little mystified by Mr. Agnew, who was entrusted with the purchase, bidding at once a thousand pounds, no further bid being made. This, it appears, was done by these devoted admirers of the works of the great landscape-painter simply to enhance their value.

THE continued ill-health of the President of the Royal Academy will prevent his occupying the chair at the approaching annual dinner. Sir G. Gilbert Scott, last year his *locum tenens*, has since passed away. Who is to take the honorary office this year is not yet known.

ON Monday last the curatorship of the Soane Museum, vacant by the death of Mr. Bonomi, was filled up by the appointment of Mr. James Wyld. By the law of the bequest this post must be filled by an architect, and within six months of the date of vacancy. We are glad to find that a gentleman so well qualified and so deserving of the honorary appointment has obtained it.

THE latest novelty in print publication is a very attractive one. It is an idyllic subject called *The Anxious Mother*, painted by Mr. E. K. Johnson, and very delicately engraved by a new artist, Mr. Arthur Turrel. The central interest of the picture is a charmingly-composed standing figure of a girl habited in a white dress and wide black hat, reminding us in sentiment of Mr. Leslie's pastoral damsels, who has lifted from the ground the young brood of the anxious mother—which is in fact a hen that stalks about in agitation. One of the chicks flutters on the girl's shoulder, and towards it she turns her head with an action resembling in an innocent way that of the coquette in the print so popular for many years in Paris called *L'Amour pour soi-même*. The print is issued by Messrs. Pilgeram and Lefèvre.

IN the forthcoming exhibition at the Grosvenor Gallery we hear that both of the most attractive exhibitors of last year, Messrs. Whistler and Burne Jones, will reappear, though not in the same force. The number of general contributors will be much greater this season than last, and the collection more miscellaneous, landscape being largely represented.

WE understand that the Duke of Sutherland has presented the Royal Geographical Society with a bust of Mr. H. M. Stanley, the work of a well-known lady sculptor.

WE have before drawn attention to the attempts that are being made in France to revive the art of mosaic, attempts which have not hitherto been marked by any great success. The *atelier* at Sèvres, however, which was opened in 1876 for the purpose of instructing pupils in this durable art is now in full work, and several artists are actively engaged upon the great mosaic frieze which when finished is destined to occupy the vacant space along the *façade* of the Museum. In northern climates mosaic certainly seems a more suitable mode of decoration than fresco for the outside of buildings, but the labour it involves will, it is to be feared, always prevent its general adoption.

MR. ELIJAH WALTON, so well known by his Alpine and other paintings in oil and water-colour, has again taken the gallery, 191 Piccadilly, and opened there an exhibition of some of his recent water-colours, the *Isle of Wight* and others.

WE learn from the *Nation* that a very competent artist, Mr. S. A. Schoff, of Newtonville, Mass., proposes to make a line-engraving from the crayon portrait of Emerson by Rowse. This is not only one of Rowse's best works, but by far the finest portrait of Mr. Emerson, and the one of which the poet Clough wrote in 1859:—"It is really, I think, without any question, the best portrait of any living and known-to-me man that I have ever seen." There will be five hundred artist's proofs, and no more, at ten dollars each, and the work will be begun as soon as one hundred names are obtained. A year will be required for its completion. Subscriptions may be sent to Doll and Richards, 2 Park Street, Boston.

THE decorations of the Paris Panthéon are still being carried on with great zeal. Besides the legend of St. Geneviève, M. Baudry has lately been commissioned to execute four large wall-paintings in the chancel, and has chosen for his subject four scenes from the history of Joan of Arc, namely, *The Vision*, *The Interview with Charles VII. at Chinon*, *The Taking of Orleans*, and *Joan in the Prison at Rouen*, with Pierre Cauchon, Loiseleur, and the English. Other episodes from her history will also be introduced by M. Baudry into the decorative frieze that runs above the paintings. The work, it is stated, will occupy the artist for about three years. Nor is it by painting only that the Panthéon is to be made beautiful. Two colossal statues, one of St. Bernard modelled by F. Jouffroy, and another of St. Jean de Matha by E. Hiole, have just been placed in it, making four of these grand statues already installed, and others are, we believe, in preparation.

A PORTRAIT of Goethe taken after his death by the German landscape-painter Prof. Fr. Preller has lately been published, after having remained all this time in the possession of the artist. Goethe, as is well known, forbade any likeness or cast from his face to be taken after his death, and his wishes were for the most part strictly regarded. Prof. Preller, however, by the intervention of the Kanzler von Müller managed to gain access to the death chamber, and to draw a slight pencil sketch in his note-book of the great poet as he lay in the manner described by Eckermann with the laurel crown on his head, his features in peaceful repose and a noble expression on his countenance. This sketch he ever after religiously treasured, showing it only to a few sympathetic friends. By some means or other, however, unknown to the artist, the celebrated Bettina von Arnim contrived to gain possession of it for a time, and had it engraved very indifferently in her book called *Goethe's Correspondence with a Child*. This unwarranted publication made the artist still more careful to keep his treasure secret, and it is only now that, certain difficulties with the Goethe family having been removed, he feels himself at liberty to make it known to the public. With this view he has permitted it to be reproduced in facsimile by the Dresden photographers Rönmler and Jonas, and to be sold for the benefit of a German charitable institution.

THE *Nouveau Temps* states that the Russian painter Verestchaguine, who accompanied General Skobelev during the late war, is now in Paris, occupied in painting some of the most terrible incidents of the campaign in which he took part.

WE have before taken occasion to mention the many artistic treasures of Hildesheim Cathedral that have been reproduced with admirable fidelity and effect for the South Kensington Museum. Besides the great choir-screen, the eleventh-century doors, the two tombs with their rudely carved figures, and the magnificent brass corona in the

South-east Court, a number of smaller works of great interest are to be found in one of the cases of the South Court, consisting of candlesticks, halices, statuettes, &c., copied from originals in the treasury of the Cathedral, many of which are supposed to have been the work of the famous Bishop Bernward, who, as is well known, not only patronised and encouraged the artist-workmen of his time, but himself worked in metal with great skill. From this treasury may be noticed also a very rich shrine, which has been added only very recently to the South Kensington collection. This shrine or reliquary is in the shape of a tower, said to be exactly of the same form as the old tower of the church. All round it are niches filled with delicately-worked little images of the Virgin and various saints; and at the top are two flat discs placed upright, and nearly touching one another, on one of which is engraved a representation of the Crucifixion. If these peculiar objects were copied from anything of the sort on the summit of the old tower, that must certainly have been a most remarkable architectural monument. The original of this beautiful little reliquary, which stands about a foot in height, is of oak, silver gilt. The cast has likewise been made. It is at present somewhat too new and audacious in effect, but its brightness will, no doubt, soon get tarnished, and the delicacy with which all the little details of the carving are rendered makes it really as valuable for all purposes of study as the original work. While praising these interesting reproductions, it is but fair to state that they are all executed by a Hildesheim artist, F. Gusehard, who devotes himself almost entirely to work of this kind. His casts, which are worked up afterwards from the originals with great skill and artistic knowledge, have none of the heavy umphish effect common in works of this kind. They reproduce the feeling of the original as well as the mere workmanship.

THE riches of the His de la Salle collection, of which we have before made mention (ACADEMY, April 6), are even greater than was at first supposed. The 434 drawings given to the Louvre are not merely the total of a collection including, as collections usually do, both good, bad, and indifferent, but the result of a careful selection of all the most valuable and noteworthy works from among a much larger number. This makes the gift of infinitely greater value, for large collections even of drawings, if unsorted, are often found more troublesome than profitable in museums, where mere repetitions should always be avoided, and only such examples chosen as are valuable for purposes of study or comparison. M. His de la Salle, with almost unparalleled consideration as well as munificence, seems to have borne this well in mind, and to have given the nation only the choicest of his artistic treasures, among which are some that will take rank, it is said, among the most valuable works of their kind in the national collection. A review giving a full account of these drawings will be contributed before long to the *Gazette des Beaux-Arts*; but meanwhile we gather from the *Chronique des Arts* that among some of the rarest and choicest pieces are:—1. A series of Early Italian drawings on parchment of the fourteenth and fifteenth centuries; one of them being a pen-drawing of *The three Dead and the three Living Men*, in the style of Benozzo Gozzoli, and another by J. Bellini, which appears to have formerly been in the celebrated Vendramin collection of drawings by Jacopo Bellini now in the British Museum. 2. Three designs by Mantegna for a monument to Virgil, commissioned by Isabel d'Este. 3. Two charming pen-and-pencil drawings by Botticelli. 4. A lovely landscape by Titian, and another by Giorgione much in Dürer's style. 5. Two beautiful sketches by Andrea del Sarto. 6. A grand composition by Giulio Romano of *Orpheus and Eurydice*. 7. Four studies by Allegri. These are only a few among the great Italian masters who are represented. Nor are the works of the Dutch school of less importance.

No fewer than seven Rembrandts are included; one of them, *A View of his Studio*, being cited as "perhaps the finest drawing this great master ever executed; comparable at all events with the magnificent landscape in the Munich Museum." A finished water-colour drawing by Ostade, of the same time probably as those now exhibiting at the Burlington Club, is also mentioned as one of the gems among the Dutch drawings. As to the French school, criticism is simply rapturous about it. "Elle brille," says M. Louis Gonse, "d'un éclat incomparable." We hope before long, when the collection is definitely arranged and exhibited, to be able to give further particulars respecting it. Meanwhile this note may serve to indicate the immense importance of the gift which the Louvre has lately received. French gratitude expresses itself in lively terms.

THE STAGE.

THE Easter novelties at the theatres are more numerous than usual. Some of these will be produced this evening, others on Easter Monday, while in one or two cases the first performance is postponed for a few days. The principal pieces are a drama at the Queen's, entitled *Madeline Morel*, by Mr. Bandmann, founded on a German play; *Such is the Law*, by Mr. Tom Taylor and Mr. Paul Meritt, at the St. James's; *Proof; or a Celebrated Case*, a version by Mr. Burnand of *Une Cause Célèbre*, at the Adelphi; a new comic drama, written for Mr. Toole, and entitled *Mind the Shop*, at the Globe; a version by Mr. Charles Reade of M. Sardou's *Andréa*, entitled *Jealousy*; an original comedy by Mr. Burnand, entitled *Our Club*. A new comedy by Mr. Frank Marshall, author of *False Shame* and *Brighton*, is also in preparation at the Aquarium Theatre.

MUSIC.

BRAMH's symphony in C minor was to musicians the chief attraction of last Saturday's concert at the Crystal Palace. Though, like much of its composer's music, written in a style too abstruse to be readily appreciated by a mixed audience, each new hearing of the work brings out more distinctly its remarkable beauty and power. The slow movement, and the finale especially, grow upon us on a close acquaintance; and we readily endorse the opinion expressed by some leading German critics, that no symphony equal to it has been written since those of Schumann. The performance of the very difficult music under Mr. Manns's direction was most admirable; every point was brought out with the utmost clearness, and if any present may have failed to understand the work the fault certainly did not lie with the orchestra. Mdlle. Anna Mehlig, the pianist of the afternoon, gave a highly finished rendering of Beethoven's concerto in E flat. The other instrumental pieces of the afternoon were the overture to *Athalie*, and Mr. J. F. Barnett's clever overture to *A Winter's Tale*, written for the British Orchestral Society, and performed at the Palace some four years ago. The solo vocalists at this concert were Mdme. Lemmens-Sherrington and Mr. Barton McGuckin, while the Crystal Palace choir were heard in Mendelssohn's psalm "Hear my Prayer," and the morning hymn from Gade's *Erl-King's Daughter*. The performance of the psalm was excellent as regards both chorus and orchestra; but Mdme. Lemmens-Sherrington, who sang the solo part, appeared to entertain on the subject of time notions of her own entirely at variance with those of Mr. Manns; and as she very seldom condescended to look at his baton the result was often anything but agreeable. In the interests of art a protest ought to be entered against the caprices of vocalists. There can only be one supreme will in the orchestra—that of the conductor; and be it right or wrong, it should be obeyed. In the present case, Mr. Manns's time was in our opinion distinctly the correct one, and

Mdme. Sherrington's wrong; but had it been otherwise it was none the less the singer's duty to give way. The responsibility for the performance rests with the conductor; and in the present instance it is more than possible that some present may have blamed Mr. Manns for an occasional unsteadiness which was certainly not his fault.

FRAULEIN THERESE HENNES gave the first of two pianoforte recitals at the Steinway Hall yesterday week—the 12th inst. The young pianist, who is only in her seventeenth year, shows very great promise. Her execution is neat, her phrasing clear, and she plays with much feeling and considerable energy. Her programme included Beethoven's Waldstein Sonata, Handel's Fugue in E minor, Mendelssohn's Rondo Capriccioso, Schumann's "Faschingschwank aus Wien," a Nocturne and an Etude by Chopin, Thalberg's Fantasia on *L'Elisir d'Amore*, and Liszt's transcription of the March in *Tannhäuser*—the whole being no light task for a young lady of sixteen. Fräulein Hennes's second recital is announced for Thursday May 2.

AT the last of the series of Mr. Dannreuther's performances of chamber music, given on Thursday week, a new and very interesting Duo for two pianos, by Mr. C. Hubert H. Parry, was performed by the composer and the concert-giver. The programme also included Beethoven's Sonata in C, Op. 102, No. 1, for piano and violoncello, the same composer's trio in B flat, Op. 97, and a selection of Schumann's two-part songs.

THE orchestral concert of the students of the Royal Academy of Music, given last Saturday evening at St. James's Hall, possessed more than one feature of interest. The orchestra was, we believe, entirely composed of present and past students and professors of the Royal Academy, while the programme, besides containing many standard pieces, included several more than creditable compositions by students. These included orchestral pieces by Messrs. Foster and Bampfylde, songs by Miss Maude White and Mr. A. J. Cockram, and a piano concerto by Mr. A. H. Jackson, a "late student." Against this last work we have not a word to say; but the policy appears questionable of introducing a piece in three movements by a former pupil of the Academy, to the exclusion of present students. Our young composers have so few opportunities for the performance of their works, and there are so many who show decided talent in the Academy at present, that it seems hardly right that they should be left out to make room for others who have presumably completed their course of study. The most important work performed at this concert was the 95th Psalm of Mendelssohn, of which a very excellent rendering was given, the solo parts being sung by Miss Mary Davies, Miss Sadie Singleton, and Mr. Sauvage. The chorus-singing of the students in this work was most commendable, while the orchestra accompanied not only correctly but with much discretion. The whole concert was conducted by Mr. Walter Macfarren.

THE commencement of the Italian opera season, always tame and uninteresting, has this year proved even duller than usual in consequence of the indisposition of several of Mr. Gye's leading vocalists. Under the circumstances, criticism of the performances was entirely unnecessary and indeed impossible until Saturday last, when one of the promised *débütantes* of the season, Mdlle. De Riti, made her appearance as Donna Anna in *Don Giovanni*. The favourable rumours concerning this artiste, and the choice of such a part for her *début*, combined to excite expectations of a sanguine nature which unfortunately were destined to be unfulfilled. The first requisite for the exponent of the great tragic rôles of opera is a voice of sonority and volume; and this Mdlle. De Riti does not possess. Her voice is deficient in power and unsympathetic in quality, while its cultivation is very far from perfect. The air "Or

sai chi l'onore" was sung in a coarse unfinished style, and suffered by its transposition to the key of C. Perhaps in a less exigent part Mlle. De Riti will prove more acceptable, but it is manifest that the successor of Theresa Titiens has yet to arrive. Of Mlle. Bertelli, who is announced to make her *début* this evening as Agathe in *Der Freischütz*, we may speak next week.

Flotow's new opera *Alma, l'Incantatrice*, was produced at the Théâtre Italien, Paris, on the 9th inst. M. Lavoix *fil.*, in the current number of the *Revue et Gazette Musicale*, speaks favourably of the work, which he says is partly founded on two of Flotow's earlier operas, *L'Esclave de Camoens* and *Indra*.

A young Italian pianist, Giuseppe Martucci, who is said to have very remarkable talent, has lately been heard in Paris.

MESSRS. BREITKOPF and HÄRTEL, of Leipzig, announce a complete edition of the works of Frédéric Chopin, uniform in style with their magnificent editions of the works of Beethoven, Mendelssohn, and Mozart.

WAGNER's *Walküre* was produced at Hamburg on the 30th ult., and, in spite of a not altogether adequate rendering, met with complete success.

THE first performances at Leipzig of the *Rheingold* and the *Walküre* are announced for the 28th and 29th of the present month.

MDME. JOHANN STRAUSS, the wife of the dance-composer, has recently died at Hietzing, near Vienna. Under her maiden name of Jetty Treffz, she was well known and extremely popular as a concert singer some years ago, both in this country and on the Continent.

Now ready, a NEW STORY, in 2 vols. crown 8vo, 12s.

A LOST BATTLE.

"S'il gagne bataille
Aura mes amours."
"Qu'il gagne ou qu'il perde
Les aura toujours."

ATHENÆUM.—"We are all the more ready to do justice to the excellence of the author's drawing of her characters. Not only does she know them herself, but she makes the reader know them too."
SCOTSMAN.—"The story is altogether a most enjoyable one, and it is in fact the author's first work, it reveals a wholly exceptional strength and maturity of power, and gives promise of great achievements in the future."

In 1 vol. crown 8vo. Second Edition. 9s.

THOMAS ERSKINE of LINLATHEN:
LETTERS from 1800 to 1870. Edited by WILLIAM HANNA, D.D., LL.D.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Resources of Modern Countries. By Alexander Johnstone Wilson. Two Volumes. (London: Longmans & Co., 1878.)

THESE volumes are the republication, with additions, of articles on British trade abroad which appeared last year in *Fraser's Magazine*, and which at the time attracted much attention. It is to be regretted, however, that in republication the subject has not been dealt with in a more complete and satisfactory manner. It is evident that in many instances the principal authorities have not been fully studied; and in many parts the work is disfigured by a tone, and by a degree of assertion, open to much objection. In a work of this nature facts should be collected and calmly stated. The opinions and individuality of the writer should be kept in the background rather than form the chief points of particular chapters. Mr. Wilson has engaged in an undertaking laborious in itself and not generally attractive. He has thus occupied the field; and it is to be hoped that in another edition the faults of the present edition may be remedied, and that the work may be put in a shape to become a standard book of reference, an authority of this kind in the English language being much needed.

The design of these volumes is good. They open with a review of the trade prosperity of the past and present generations in this country, which, apart from dogmatic assertion, is worth reading. Chapters are given on India, China and Japan, the United States, Russia, Turkey and Egypt, Austria-Hungary and Germany, France and Belgium, Italy Spain Portugal and the Netherlands and their respective colonies, Canada and South Africa, Australia and New Zealand, Mexico and Brazil, the River Plate, Chili and Peru, the British West India and other possessions. This order of treatment is involved for a completed work: an arrangement of questions under European, Asiatic, American, and Colonial interests would seem better.

The objections in regard to assertion and tone of argument render it best in our limits to pass over without other remark the portions of these volumes which relate to India, China, Russia, Turkey, Egypt, and Spain. The chapter on the United States contains good remarks on the extension of the Union and its material progress. The accounts of speculation and inflation in Austria, of German industry, of the octroi and taxation, finance generally and banking in France, and of Italian shipping, are good.

The chapters on British Colonies are worth reading, and contain sound remarks respecting their finances and their tendency to enter upon enterprises beyond the requirements or the strength of these newly settled countries. The chapters on South America are, generally, good, and should be read by persons seeking information relative to the different South American States. Without adverting to minor mistakes, it will be sufficient to mention two errors of importance. At p. 257, vol. i., Mr. Wilson attributes the diminution of our trade with Persia and Turkestan to the expiration of some treaty by which Russia allowed our trade access to Tiflis. No such treaty has expired: this country stands in this respect in precisely the same position now as at any time during the last eighteen years. The diminution is owing to the Persian famine, bad silk seasons, and the protectionist Russian tariff which has checked foreign trade. Again, at pp. 306 and 312 it is stated that the Austrian tariff for British goods which was in force from January 1, 1870, to December 31, 1876, did not expire at the last date; whereas for cotton and wool manufactures it did expire then, and these manufactures and all other British goods have since that date entered Austria-Hungary under the Austro-Zollverein tariff of 1868 in virtue of "most favoured nation" stipulations. In the remarks on the recovery of France after the German war, sufficient account is not taken of the very favourable agricultural seasons, especially as regards the vintage, which is the great staple commodity of the country, since the war. The Belgian iron trade is shown to be in a position as unsatisfactory as the iron trade in the United Kingdom. The fact is that during the Franco-German war little iron was produced in either France or Germany, and that an enormous demand for Belgian iron arose in each of those countries. A great inflation, and then an equally great crisis, ensued, with all the unhappy consequences of such a state of things. In the chapter on Spain reference is naturally made to the English wine duties, but while severe remarks are made upon them, the reason on which they are founded, rightly or wrongly is another consideration, is not given. Briefly it is as follows: wine is either a natural or an alcoholised product; it is assumed for fiscal purposes that there is a limit beyond which the strength of natural wine does not reach, and therefore that all wine possessing a strength beyond that limit has had alcohol added. Twenty-six degrees of proof spirit was taken, after a very full enquiry in 1861, to be that limit. But as matter of fact, any such limit can be only approximate; strength varies according to seasons and other circumstances. Twenty-six degrees is too high merely to include low-priced and light wines, while it excludes some natural wines. The real grievance, however, is making the duty on wine under 26° 1s., whereas between 26° and 42° a single rate of 2s. 6d. is imposed on all wines alike. The remedy on this point is to graduate the scale.

It is strange that Mr. Wilson does not put forward the extreme importance of the system of commercial treaties, beginning with the Cobden Treaty of 1860, which

during the second French Empire were entered into by almost all European nations. They did not, it is true, establish complete free-trade: the time was not then, and is not now, ripe for it. But they broke down the old system of prohibition and of differential duties, they opened out vast fields of commerce, and they prevented in 1872 a return to protection in France. Those treaties were the main cause of the great commercial prosperity of Europe after 1860.

The chapter at the end of the second volume containing the conclusions arrived at after the general review in the preceding chapters is, apart from exaggerated opinions with respect to the land laws in England, the Eastern Question, and Indian affairs, good, and more sober in tone than many portions of the work. It contains sound statements respecting the vast debt heaped up in recent years in almost all countries, and which is often regarded with such strange complacency. Attention is well directed to the unsatisfactory position of social and political affairs throughout the world, and to the various problems which bode the world little rest till a great settling of accounts has taken place.
